In what has just been said it will be seen that there is no distinct line of demarcation between the inflammatory swelling and the hypertrophy, between the hypertrophy and the tumour proper, between the simple and the malignant tumour. The local irritation can be traced in the case of the inflammatory swelling and the hypertrophy, and it is highly probable that both the simple and the malignant tumour are also due to local irritation. It must, however, be acknowledged that it cannot always be traced. If the malignant tumour is not due to local irritation, but to a general dyscrasia or peculiarity of the patient, the surgeon has slight grounds for recommending its removal. If, however, he believes that all tumours are evidences of local irritation, he is fully justified in recommending their early and complete removal—in the case of the malignant tumours before they have time to spread by the lymphatic or blood-stream to distant parts, in the case of simple tumours before they have assumed characteristics of malignancy, as these tumours sometimes do. The mammary gland has been taken as an example of an organ in which tumours frequently occur. The reason for this frequency, if we believe in local irritation as a cause of tumour-growth, is not far to seek: from the time of puberty to the time when it terminates its functional activity this gland is in a constant state of vascular unrest and functional change. Both forms of tumour are met with in all the organs and tissues of the body. Simple tumours are generally composed of fully developed tissue, similar to the tissue in which they lie, the simple fatty tumour occurring in connexion with fatty tissue, the simple fibrous tumour in connexion with fibrous tissue, the osseous tumour in connexion with bone. The malignant tumour, on the other hand, is generally formed of undeveloped tissue which has not yet fulfilled its destiny, which is not only misplaced in situation but in time. The cartilaginous tumour has its prototype in cartilage, for that which covers the ends of the long bones and enters into the formation of a joint is a fully developed tissue. The true prototype of the cartilaginous tumour is not, however, fully developed cartilage, but one or other of those forms of cartilage which, as regards their developmental

Various forms of tumour.

[1] Compare PATHOLOGY, vol. xviii. p. 367 sq.

position, are intermediate between fibrous tissue and bone, and therefore the cartilaginous tumour has frequently a life history more closely allied to the malignant than to the simple type of tumour formation.

No attempt can here be made to classify the different forms of tumour. The surgeon at the bedside meets with tumours as living parasitic formations. He studies their life history; he observes their birth, their growth, their peculiarities, and their tendencies; he naturally attempts to classify them from a study of their physiological or clinical aspects. The pathologist, on the other hand, examines the tumour after it is removed; he studies it as it appears to the naked eye and under the microscope; and he attempts to classify tumours from an anatomical standpoint. Within recent years the pathologist's classification, associated with a recognition of the developmental division of the human embryo into different layers, has become the favourite; but it is hoped that, as science advances, the increase of clinical knowledge, assisted by microscopic and embryological research, will make a physiological classification a reality.

IV. OPERATIVE SURGERY.

Range of surgical operations. Within recent years the main advance in surgery has been from the scientific side, due to increased precision in physiological knowledge and a careful study of the relation of organisms to various diseased conditions. And with this progress operative skill, in many directions previously unthought of, has kept pace. Cranial operative surgery has advanced as the motor areas on the surface of the brain have been localized with greater precision. The experimental physiologist has done his part; the clinical observer is now doing his. Cranial surgery necessitates special notice. In the thoracic cavity also diseased conditions are now relieved by surgical operations. The greatest advance of all, however, is in connexion with the abdominal cavity. Under this head the work of the last thirty years requires special notice. The peritoneum was at one time considered a closed book to the operator; now all is changed, and abdominal surgery has become one of the most important branches of operative work. Joints in a state of inflammation are also now freely opened and tension is relieved. With the relief of tension the inflammatory process subsides and the joint recovers. The excision of diseased joints has also become part of the everyday work of the surgeon. Cancerous affections—using the term in a clinical sense—of the tongue, rectum, and larynx are now treated by excision of these organs. But it is still a question in what cases the operation prolongs life, and what cases are specially suited for operation. While greater latitude has been given to surgical interference with the different cavities of the body, operations upon the limbs have been restricted in consequence of the acceptance of Lister's views with regard to wound treatment. Many limbs upon which formerly amputation was performed, as, for example, in the case of compound fractures, are now saved.

Conservative surgery. The term "conservative surgery," which formerly had reference to the excision of a diseased joint instead of amputation of the affected limb, has now a wider meaning, and covers not only the different excisions which have taken the place of amputation but also those cases in which a limb is saved by careful antiseptic management after severe injury. At one time, perhaps, in the early stages of antiseptic wound treatment the brilliancy of the results obtained by these means, and the immunity which resulted from the prevention of blood-poisoning, encouraged surgeons to save a limb which, when the wound was healed, was not really useful. An upper limb saved, however inefficient, is better than any artificial substitute, and every endeavour in the direction of conservation should be made. Conservation in the case of a lower limb, on the other hand, may be carried too far. Unless the saved limb can support the weight of the body, it is far better to perform amputation, because a satisfactory artificial substitute can be found to take the place of the lower extremity. In performing amputation on a lower limb every endeavour should be made to obtain a stump which will bear, in part at any rate, the weight of the patient's body.

Modern surgical procedure. Since the introduction of anæsthetics rapidity in performing an amputation is not essential. Flaps can be carefully made; time can be taken to shape them; and they can be so arranged that the resulting cicatrix will not be opposite the sawn extremity of the bone. In order to obtain such flaps the surgeon is justified in sacrificing to some extent the length of the limb, if by so doing he can leave a mobile and painless stump on which an artificial limb can be comfortably fitted. But this does not hold good to the same extent for an upper limb. The pressure on the extremity is not so great, and the longer the stump the more easily can an artificial substitute be fitted on. As a result also of Lister's teaching operative procedure for the cure of various deformities, such as knock-knee, rickets, and club-foot, in which the bones affected are freely attacked has done much to relieve unsightly deformity and increase the usefulness of the individual. In all operations absorbable catgut ligatures for the cut vessels have since about 1861 taken the place of silk, which had to come away by ulceration,—a destructive process antagonistic to rapid healing. Greater care is taken to save blood by emptying the part to be operated on before beginning the operation. Greater care is also taken to tie all bleeding points, so as to prevent reactionary hæmorrhage and the escape of blood between the surfaces of the wound, whereby healing is retarded. Free drainage by india-rubber and glass tubing, by absorbable tubes made of decalcified bone, by skeins of catgut acting by capillarity—all the outcome of an understanding of the local irritation and constitutional fever caused by tension—have done more than anything else to enable the surgeon to attain his triple object,—painlessness, rapidity, and safety in the healing of a wound. Lastly, the clear understanding of the term "antiseptic" in its fullest meaning, the knowledge of the power which the unirritated and healthy tissues have as germicidal agents, and the introduction of various antiseptic or rather antitheric substances, some of which destroy, some of which paralyse, those lowly organisms whose power for evil in an unhealthy tissue or an injured part is so great, contribute towards the same great end. By these means operations are to a great extent relieved of their dangers, and by anæsthesia, which prevents pain and suffering, they are robbed of their terrors. (J. C.)

1. *Cranial.*

The necessity for setting apart a distinct section of this article to deal separately with the region of the head does not depend upon any specialization in the principles of treatment peculiar to that region. The general laws of surgical procedure hold good here as elsewhere throughout the body; but they have to be exemplified in relation to a region so separated from others in its architectural and functional peculiarities as to call for special record and delineation. The surgeon has to deal with a most intricate series of considerations—anatomical, physiological, and psychic—in devising suitable treatment for abnormal conditions in this region; the inter-relation of cranial tissues and organs, their capital importance in the physical economy, and the position of some of them as the substrata of mental activities render any surgical interference a matter of great delicacy and grave anxiety. So much is this the case that it has been left for the most daring and the most modern surgeons to prove that this is a region to which ordinary surgical rules may properly apply; and hence what must be here recorded is largely matter of quite recent history and to a large extent at variance with the doctrine of former epochs.

Function of the cranium. The function of the cranium as a protective agent for the brain and the organs of special sense is strikingly shown by its architectural design. The proper discharge of this function is of paramount importance from the economic value of the cranial contents; and the demands upon it are the more exacting from the extreme delicacy of physical structure and the unstable physiological equilibrium present in the brain. Clothed externally by the densely resisting textures of the scalp, further protected by a layer of heat-deflecting hair, the cranium itself consists of a firmly welded bony casket of ovoid form, maintained in its balanced position upon the upright spinal

column by a series of ligamentous and muscular bands There is thus protection against the sun's rays and a general mobility that provides for the avoidance of impending blows But the cranium has chiefly to receive and annul transmitted physical vibrations, the result either of blows upon the head or of those jars and oscillations, incidental to bodily movements, which would interfere greatly with the functions of the brain did they actually reach it

Protective mechanism

The function of the cranium in this respect has been fully described by Hilton, who shows that special bony ridges are present in the skull which arrest vibrations and divert them into channels where their action is no longer deleterious Three series of such buttresses descend from the vault to the base of the skull, where they converge in the region of the sella turcica at a point termed by Felizet "the centre of resistance," and where the terminations of the ridges come into immediate contact with the cartilage of the foramen lacerum medium or the lake of cerebro spinal fluid which surrounds the anterior and posterior clinoid processes The transmitted vibrations are thus annulled by transference to a liquid or a soft solid medium, and lose all further power In addition to the special mechanism which mitigates the effect of considerable shocks and renders slight ones ordinarily imperceptible, there is a general elasticity of the skull which enables it to withstand great violence without material injury and so enhances its protective power This elasticity is not uniformly present, but is much more developed in the bell like vault than in the region of the base The osseous texture also is much more brittle in the latter locality When, therefore, such severe shocks are communicated to the skull as overcome its elasticity and its power of resistance, the fracture which ensues is found as a rule to involve the base much more seriously than the vault

Effects of violence

These physical qualities are of great importance as giving an index of the relative resisting powers of different parts of the skull, and as affording data that may assist in determining the position of a fracture from a study of the forces which caused it Of such forces those that are closely circumscribed in their area of application produce strictly local effects, whilst diffuse blows produce their most marked effects at a distance from their point of application The former fact needs no illustration, the latter has been made the subject of numerous researches in relation to the usual course of cranial fractures From the results of these investigations three different etiological laws have been educed—(1) Saucerotte's law of *contrecoup*, (2) Aran's law of radiation, and, in special relation to fractures of the base of the skull, (3) Von Wahl's law of parallel cleavage In its special sphere each of these laws probably holds true, but the sphere of each is a limited one and is dependent upon the local peculiarities of the skull already described

Theory of contrecoup

The theory of contrecoup is that a force produces its maximum effect at the opposite pole of the skull to the point of its application That this law can have no general bearing is shown by the numerous cases in which the fracture bears no such relation to the force which causes it In relation to a limited area of the vault, however, it appears to hold true, for isolated fractures of the base resulting from blows upon the vault are on record, but as these are the only fractures which this theory would explain, and as they are very rare, its range of action is very greatly curtailed

Law of radiation

Aran's law of radiation is that, starting from the point where the blow is received, a fissure traverses the walls of the skull in the direction of the base and spreads itself in that fossa of the base of the skull which corresponds to the part of the vault that is struck Thus a diffuse blow on the frontal bone causes injury to the anterior fossa of the base, and blows upon the parietals or occipital bone cause similar injury to the middle or posterior fossa respectively This law holds true of the great majority of fractures of the skull and will assist in localizing the course of a fracture when the part of the skull first struck can be recognized

Law of parallel cleavage

But numerous cases of fractured base are on record in which no fissure can be traced leading from the point first struck, and from a study of these Von Wahl has concluded that fractures of the base, whether connected with fissured vault or isolated, are always parallel to the direction of the force which caused them Thus blows upon the frontal and occipital regions cause longitudinal fissures of the base, in the temporal region oblique fissures, and in the mastoid region transverse fissures An index of the probable direction of a fracture is thus obtained by observing the exact point of incidence of the blow which caused it, whether other evidences of localized injury to the cranial contents be forthcoming or not

Symptoms of fracture

The diagnosis of the presence of a fracture is often a matter of great difficulty, especially where the soft parts are still intact, and by their contused and swollen condition mask the true nature of the case Apart from obvious external signs of injury, the following symptoms should lead to the suspicion of a fracture —bleeding from the mouth, nose, or ears, local ecchymoses or lacerations, as that of the membrana tympani, circumscribed hæmorrhages, as under the scalp or visceral conjunctiva, interference with the functions of the brain or special sense organs, as aphasia, motor spasms or paralyses, blindness, deafness, an altered condition of the respiration or the pupils, slight unconsciousness or profound stupor The immediate risks to life are from shock and compression, the latter due to depressed bony fragments or effused blood The treatment of shock has already been alluded to (p 680 above), that of compression consists in the early relief of pressure by trephining, with elevation of the depressed fragments and removal of the blood clots, if the symptoms are advancing

Question of trephining

These symptoms are increasing stupor, stertorous respiration (Cheyne-Stokes breathing), relaxation of sphincters,—the condition passing on to complete coma In cases where pressure symptoms are not urgent (especially in young patients with elastic skulls) and in cases where no such symptoms are present, expectant treatment should be employed,—complete rest, local cooling applications, constantly applied, the exclusion of all stimuli to the special sense organs or to the attention, and a careful watch for further symptoms Should symptoms of compression appear and advance, or should slight symptoms already present become aggravated, immediate operative interference for the relief of pressure as above indicated must be resorted to, and in operating in this region it must be remembered that strict antiseptic precautions are essential, for in no region of the body—not excluding even the peritoneal cavity—are the effects of septic infection more disastrous and at the same time so hopeless of remedy

Topographical

Having thus alluded to the physiology and surgery of the cranial envelope, it remains to consider the corresponding aspects of the cranial contents The older theory of Flourens and Hertwig, that areas of all parts of the brain are equally concerned in producing its aggregate brain activities, has been displaced by the more recent theory of the localization of function This theory is supported by the results of recent physiological and pathological investigations, the former carried on for the most part by Hitzig, Fritsch, and Ferrier, the latter by Broca and Meynert The practical outcome of these researches—viz, an adaptation to the human brain of results obtained in that of the higher mammals, controlled by pathological observations on the human brain itself—is that the surface of the brain can be mapped out into a series of topographical areas, each of which occupies a definite relationship to some well-defined function—motor, sensory, or psychic—of the human economy Of the areas connected with psychic activity little is at present known, they are generally believed to occupy the frontal lobes of the brain

Localization of cortical function

In the parietal region grouped around the fissure of Rolando are the cortical areas connected with motor functions in the extremities, and around the horizontal limb of the fissure of Sylvius are arranged those concerned in general and special sensation The results of these researches confirm the views of Hughlings Jackson, who has conclusively demonstrated the cortical origin of those epileptiform seizures in which the motor phenomena are limited to particular groups of muscles At the same time these results open a new field of anatomical and surgical inquiry, with the object of defining what relation the cerebral convolutions bear to external cranial land marks, and of showing that circumscribed cortical disease or injury is capable of detection and relief

Relation of convolutions to surface of head

For practical purposes in the present state of our knowledge of cerebral physiology, the first part of the question limits itself to an exact delineation of the position of the fissures of Rolando and Sylvius in relation to well known cranial landmarks In regard to the position of the former several researches have been made, and its upper extremity has been localized at a point 2 inches behind the coronal suture in the mesial line by Broca, Turner, and Féré For the purpose of its exact determination in the living subject, where the line of the coronal suture cannot always be detected, measurements have been made and formulæ for its localization devised by Giacomini, Lucas-Championnière, Hare, and Reid (see the literature cited below) The commencement of the fissure of Sylvius is situated $1\frac{1}{4}$ inches behind the external angular process of the frontal bone

Trephining for cortical disease

As an outcome of these additions to our knowledge of accurate facts, a new branch of surgical procedure is now firmly established and already sufficiently supported by successful results, viz, trephining for the relief of cortical disease Encouraging cases have occurred in the hands of Hughes Bennett and Godlee, Fraser and Cheyne, and Victor Horsley The last-named presented to the British Medical Association meeting in 1886 three patients relieved by this operation from cortical lesions As a result of wide experience in operating upon apes and upon human beings, Mr Horsley accentuates the importance of employing the following precautions in operative interference —(1) thorough cleansing and disinfection of the scalp, (2) the use of chloroform as an anæsthetic, morphia having been previously given to reduce cerebral congestion and to obviate excessive hæmorrhage during the operation, (3) strict antiseptic precautions, (4) a semilunar incision through the soft parts, (5) the use of large trephines, (6) Macewen's method of replacing the bone in small fragments carefully purified The occurrence of hernia cerebri signifies a failure in the antiseptic precautions, and a primary union of the integuments is a matter of the most extreme importance In removing the tumour or scar-tissue the knife is preferable to the thermo cautery [1] (A W H)

2. *Thoracic*

Purulent collections in the pericardium and pleural sacs may be treated as ordinary abscesses by incision. In the case of the pleural cavity the pus may be evacuated through an opening made in the axillary line at the seventh costal interspace; but it is quite possible to empty it thoroughly at the fifth. A drainage tube is inserted, protected by a broad flange, that it may not slip into the cavity, and strict asepsis should be secured. Should sepsis occur, the wound should be washed out, and a counter opening made if necessary. As the lung, however, frequently will not expand, and a large cavity is therefore left to heal by granulation, with little chance of it ever getting filled up, surgeons have excised portions of the ribs in order to bring about a collapse of the chest wall and thus ensure obliteration of the cavity. The second, third, fourth, fifth, and sixth ribs have been partially removed, together with a portion of the clavicle. It is better in young people to remove the periosteum also. Some surgeons cut away the thickened pleura as well. The possibility of opening into the pleural sacs and pericardium for the removal of tumours has been demonstrated by König and Küster, who have reported cases where growths in connexion with the sternum and ribs were successfully removed. Special care was taken that as little air as possible should gain access to the pleural cavities. Attempts have also been made to tap and wash out vomicæ in the lung, but as yet operative interference in such instances is not fully established.

3. *Abdominal*

Modern surgery has made its greatest advance and has achieved its most signal triumphs in connexion with operations performed in those cavities of the body which are lined by a synovial or serous membrane. The older surgeons did not dare to systematically attack the joints and the cranial, thoracic, and abdominal cavities; but the surgeon of to-day performs the most daring operations here with confidence, and is rewarded with a success which at first sight appears almost marvellous. The timid extraperitoneal manipulations of former days made use of in the treatment of hernia and kidney disease and in the formation of artificial anus, have now given way to systematic intraperitoneal modes of treatment, whereby we aim at the radical cure of hernia and bring disease affecting any of the abdominal viscera directly under our control. We have to consider the conditions under which wound treatment of the peritoneum is placed, and in what respect this portion of the human framework reacts upon injuries as compared with the general behaviour. It is generally acknowledged that rest in the surgical sense, the factor necessary for healthy wound closure, is obtained by a condition of asepsis and fixation. Moreover, it is generally granted that tension as a condition of unrest is dangerous not so much in itself as in the character of the material that gives rise to tension; hence the extravasated serum and blood in a case of simple fracture give rise to comparatively little disturbance. The presence of ascites need not lead to fever. But once let sepsis gain entrance and the fermenting exudate is resented by the organism; violent attempts to throw it off are made, and forms of blood-poisoning more or less severe and variable ensue. In a severe injury of the extremities, say a compound fracture, the effused serum and blood-clot are not readily removed by the damaged lymphatic system, and, when that does act, sepsis having already occurred, the absorption of the putrid fluid does much harm. Fortunately the open character of the wound may allow the fœtid discharge to escape. In any case, the surgeon ensures a good result when he makes use of splints, drainage, and antiseptics. He brings about local fixation, removes the excessive exudation, and so relieves the lymphatics and prevents sepsis. In the case of a penetrating abdominal wound, where the healthy peritoneum is injured, we have some what different conditions, mainly varying in degree. It must ever be borne in mind that here we open into a huge lymph-sac. The peritoneum consists of a sheet of vascular and lymphatic network, covered with epithelium and provided with stomata. It is easily injured, and then rapid effusion ensues. Like most vascular structures, however, it heals quickly with favourable surroundings, and, the source of irritation having been removed, it speedily returns to the normal. In comparison with the large absorbing surface the injured portion is but small, and the effusion thrown out at the seat of injury may readily enough be absorbed by the remainder of the healthy sac. So long as the rate of absorption equals that of effusion tension cannot exist. If, however, the nature of the fluid be of importance, it is evident that nowhere in the body is this more marked than in the case of the peritoneum, and here above all other parts must we preserve strict asepsis. This may be gained in various ways. (1) By drainage, in which case the surgeon carefully draws off from the pouch of Douglas any excess of fluid thrown out as the result of injury, until such time as the peritoneum itself has recovered its full absorbing power and the excessive secretion has ceased. (2) Where by careful sponging the operator so far relieves the peritoneum and then, closing the wound to prevent entrance of further sepsis, leaves the rest to nature. For, if we do permit a moderate septic inoculation, it is evident that the rapid change of fluid may prove inimical to the development of septic ferments and the contact of healthy tissue will finally render impossible the existence of organisms. The presence, however, of any accumulation of putrid effusion is at once resented by the peritoneum and an attempt by local peritonitis may shut off the collection, or even previous to any local reaction septic absorption may prove fatal, or again severe general peritonitis may kill the patient. (3) From the above we at once see how applicable the antiseptic system must be to the abdomen, and the most signal success has crowned attention to matters of detail in this respect. By means of antiseptics we can securely close the abdomen, resting assured that the peritoneum is perfectly capable of carrying off effusions due to our interference. Where we dread that oozing may complicate matters, the drainage tube can in addition be employed, but the necessity for its use becomes less marked as the operator acquires experience. Abdominal surgery requires from beginning to end the utmost care, and it is well that specialists reached a high standard of success before the adoption of the antiseptic system, since various points have been formulated, all of which, however, are of minor importance compared with the one great end in view,—that of asepsis from first to last. The utmost care should be taken to ascertain the general bodily condition of the patient, to see that the kidneys are healthy, and to select an anæsthetic suitable to the requirements of the case. The temperature of the room, the clothing during operation, rapid dexterous manipulation, and preventives against hæmorrhage require the utmost attention. The patient should be prepared by having had low diet and gentle purgatives for a few days prior to surgical interference, so that rest of the intestinal tract may readily be assured. As a material for ligature fine silk Chinese twist, of various sizes, may be employed. It must be carefully disinfected by boiling, and is readily preserved pure in a five per cent. solution of carbolic acid. The ends should always be cut short. It possesses certain advantages over catgut.

Peritoneal wound treatment.

In reviewing the field of abdominal surgery we must study shortly the methods and results gained by ovariotomy, removal of the uterine appendages (ovaries, Battey; tubes, Tait), hysterectomy, myotomy, removal of fibroid tumours of the uterus, intraperitoneal operations on the kidney, liver, spleen, intestinal tract, including stomach, pylorus, duodenum, small and large intestine. Finally, attention should be given to the extraperitoneal operations for sarcoma and disease of the kidney and intestine.

Ovariotomy.

From 1701, the date when Houston of Carluke, Lanarkshire, carried out his successful partial extirpation, progress was arrested for some time, although the Hunters (1780) indicated the practicability of the operation. In 1809 Ephraim M'Dowell of Kentucky, inspired by the lectures of John Bell, his teacher in Edinburgh, performed ovariotomy, and continuing to operate with success established the possibility of surgical interference, and was followed in the United States by many others. The cases brought forward by Lizars of Edinburgh were not sufficiently encouraging; the operation met with great opposition, and it was not until Clay, Spencer Wells, Baker Brown, and Keith began work that the procedure was placed on a firm basis and regarded as justifiable. Improved methods were introduced, and surgeons vied with one another in obtaining good results, until by the introduction of the antiseptic system of treating wounds this operation, formerly regarded as one of the most grave and anxious in the domain of surgery, has come to be attended with a lower mortality than any other of a major character. We may now briefly outline the mode employed in operating. The room should be well heated, be free from draughts, have a good light, and above all a pure atmosphere. The patient is secured to a firm table and well protected with blankets. Anæsthesia having been obtained, the state of the bladder being known, and the urine drawn off if thought necessary, the surgeon purifies the integument with carbolic acid five per cent. solution, attending specially to the region of the umbilicus and pubes, which latter should be shaved. A large perforated waterproof sheet may be spread over and secured to the body, through which the more prominent part of the tumid abdomen protruding presents a localized field for manipulation; this also protects adjoining parts and obviates unnecessary exposure. An incision 2 or 3 inches in length in the linea alba and midway between the umbilicus and the symphysis pubis carries the surgeon down to the interval between the recti; bleeding points are seized with pressure forceps; and by a

Anat. and Phys.*, January 1884; Reid, *Lancet*, vol. ii., 1884, p. 539; Hughes Bennett and Godlee, *Brit. Med. Journ.*, May 1885; Victor Horsley, *Brit. Med. Journ.*, vol. ii., 1886, p. 670.

further use of the knife the subperitoneal fat is exposed, the peritoneum divided, and its free edges seized with forceps The operator next introduces his finger and with the scissors enlarges the wound downwards or upwards on the left side of the umbilicus if necessary The entire hand is then introduced between the parietal peritoneum and the tumour and swept around so as to ascertain the condition of affairs, and even to separate gently slight adhesions A few sponges are next packed round the exposed tumour surface, which serve to keep the intestines and omentum out of the way and to retain any tumour content which may escape during tapping With a large trocar, aided perhaps by an exhausting jar, the contents are drawn off, and, as the tumour collapses, its folds may be caught by forceps and the whole sac gradually pulled outside the abdomen The pedicle is clamped by strong forceps, the tumour is cut off, the stump of the pedicle is carefully ligatured, the clamping forceps removed, the peritoneum carefully sponged out, more especially the pouch of Douglas, the ligature cut short, and the pedicle dropped into the cavity of the abdomen At this stage the forceps and sponges are counted, a definite number being always employed, and, their tale being perfect, the surgeon proceeds to close the wound For this purpose his needle traverses the entire thickness of the parietes from peritoneum to skin, the stitches should be about one third of an inch apart, and closer apposition is gained by secondary sutures, which go through the integument alone A dressing is now applied, and for the next few days the patient gets little else than occasional spoonfuls of hot water and milk, unless brandy be necessary, until she passes wind, after which time the usual diet is gradually resumed It is necessary that the most precise precautions be taken against septic infection The sponges are steeped in a five per cent solution of carbolic acid, then dipped in boiling water, and squeezed dry immediately before use Should the contents of the cyst be too viscid to run through the trocar, the contents of the sac must be pulled out with the hand Adhesions to various organs must be dealt with by careful separation and ligature Rents in the peritoneum should be stitched up with fine catgut, and some operators also stitch over the stump of the pedicle, or bury it in a bared portion of the adjacent broad ligament, so that it may not contract adhesions While the great majority of surgeons are at one as regards the use of antiseptic precautions, they do not agree as to the use of the spray Many dispense with it altogether Some employ it in the room prior to the operation A few surgeons also, without availing themselves of the antiseptic system, appear to obtain as good, if not better, results than their fellows It may also be noted that the antiseptic in use by different operators varies, and that, while the pedicle is usually ligatured, Keith attaches great importance to the clamp and cautery introduced by Baker Brown The drainage-tube is not now so frequently employed as formerly The statistical results show an increasing success in the case of every surgeon Spencer Wells tells us that in his first five years one patient in three died, in his second and third five years one in four, in his fourth five years one in five, in 1876-77 one in ten, since the introduction of antiseptics (complete Listerism), 1878 84, 10 9 per cent,—the last series showing a marked absence of septic fatality Keith in 1884 reported a mortality of 9 11, for merly, when using the spray, he once had a successful consecutive series of 80 Koeberle up to 1878 had performed 300 operations, of which 231 had a favourable result Of 300 patients operated on by Schroeder up to 1882 258 recovered, in the last hundred cases there were only 7 deaths Other figures are—Knowsly Thornton, 423 cases, 40 deaths, Tait, 405 cases, 33 deaths, and in 1885 (including parovarian cysts) 139 cases, no deaths, Olshausen (1885), 293 cases, 27 deaths (in the last hundred only 4 deaths)

Removal of uterine appendages Removal of the uterine appendages, the ovaries and Fallopian tubes, is performed for three distinct conditions—(1) for disease, when the tubes are the seat of inflammatory changes and distended, or when the ovaries are the seat of cystic and cirrhotic changes, (2) for fibroid tumours, in which case by operating we hasten the menopause and bring about involution, (3) in cases where dysmenorrhœa is wearing out and rendering useless the life of the patient, and where less severe treatment is ineffectual Oophorectomy, by which we mean removal of the ovaries only, was introduced by Battey of Georgia in 1872 It is now replaced by the more extensive procedure of Lawson Tait, salpingo oophorectomy The operation is sometimes followed by loss of sexual feeling and has been said to unsex the patient, hence strong objections have been urged against it The patient and friends should clearly understand the object and results likely to be gained According to Angus Macdonald, "as soon as we are certain that the ovaries or tubes are distinctly diseased and are not likely to yield to our ordinary methods of treatment we are bound to at least inform our patient of the possibility of relieving her by operation The operation presents greater difficulties and is associated with a higher mortality than ovariotomy" The greatest care must be taken in making the initial incision for fear of wounding the bowel The organs are not uncommonly deeply placed and have contracted adhesions Every trace of ovarian tissue should be removed along with the tubes and the ligatures must be carried close up to the uterus The stitches should be placed closer, since the tendency to hernia is greater

Hysterectomy. In cases of fibroid tumour—myoma—the surgeon must be largely guided by the condition of the patient and the new growth as to whether removal of the uterine appendages is sufficient If it is not and the patient is in such danger that the next period threatens life, he had better proceed to hysterectomy or entire removal of the uterus and appendages When we consider the circumstances under which this operation is performed, the weakly anæmic state of the patient, the size of the tumour, and the rapidity with which procedure should be conducted, we must regard hysterectomy as one of the gravest in the domain of surgery There is, moreover, a special danger which does not obtain in ovariotomy,—the risk of septic poisoning Since we cut into the canal of the uterus, it is obvious that we open into a septic cavity, and it is impossible merely to ligature and drop the pedicle, since by doing so we should court failure The surgeon, having made a way into the peritoneum, seizes and ligatures adhesions, projects the tumour through the wound, clamps the pedicle (cervix uteri), removes the tumour and uterus, and closes the wound, leaving the clamped pedicle protruding It is advisable to scoop out the septic central canal of the pedicle and carefully to pare away surplus tissue, and as dressing to have a plentiful supply of some potent non-irritating antiseptic in contact with the stump If we take care that the septic focus is removed without coming in contact with its surroundings, if we keep the stump aseptic and dry, there will be little fear of septic fluid trickling down the side of the pedicle and causing septus, peritonitis, or blood poisoning Attempts have been made, by careful disinfection of the stump, paring its centre, careful ligature, and stitching its raw surfaces together, to treat the pedicle by dropping it into the abdomen as in ovariotomy, but as yet with no marked success The results of hysterectomy in the hands of Keith (33 cases, 3 deaths, in 1885) stand unrivalled Similar principles guide the performance of cæsarean section and Porro's operation

Removal of gall-bladder Affections of the liver and gall bladder have also been treated by laparotomy In the latter case an incision is made over the swelling, and the gall-bladder, having been exposed, may be removed or explored, gall-stones cleared out, the walls stitched to the sides of the abdominal wound, and a drainage tube inserted as occasion requires The spleen has also been attacked In removal of the **spleen**, entire organ special care must be taken that none of the larger veins give way during manipulation Most careful ligation and subdivision of the pedicle is requisite In recent years the surgery of the **kidney** has made gigantic strides There are three modes of reaching the organ, each of proportionate value according to the nature of the case (1) From the lumbar region In this way we may open abscesses, remove calculi, and even extirpate if the kidney be not enlarged Increased room may be obtained by removing the twelfth rib By this method we gain sufficient and dependent drainage and we need not open the peritoneum (2) As in ordinary laparotomy, making an incision in the middle line This admits of our examining both organs and to a large extent determining the condition of each We get free access and can more readily treat the pedicle of vessels and the ureter We open into the peritoneal cavity and again divide the peritoneum, but our incisions are readily closed and we no longer dread interfering with this huge lymph sac For tumours of the kidney this method is clearly indicated (3) Langenbuch has proposed making an incision along the outer border of the rectus, which is said to present advantages in certain cases

Portions of intestinal tract Since the advance of ovariotomy the possibility of removal of portions of the intestinal tract with a subsequent suture of the divided ends has been repeatedly demonstrated, and thus resections trial for disease of the pylorus and bowel have been successfully performed In cases of gunshot wound, laparotomy, arrest of hæmorrhage, careful cleansing of the peritoneum, and suture of the wounded gut is now the established practice Bull of New York reports a recovery in a case where seven wounds in the gut were sutured All laparotomies are founded on the type of ovariotomy, success depends on the fact that two opposed serous surfaces rapidly unite, and this fact must ever be borne in mind when we tear or injure the bowel and its coverings, or unite them Sepsis is the main disaster likely to attend our interference, but with the means at our disposal, washing out the peritoneum if necessary, we should be able to obviate this

In regard to operations on the abdominal organs in which we do not interfere with the peritoneum it is sufficient to note that from the lumbar region we can reach the colon, where it is uncovered by serous membrane, the kidney, and retroperitoneal tumours[1] (F M C)

4 *Deformities*

(1) For club foot, see vol vi p 42

(2) During the last few years, in consequence of the safety with

[1] The literature of abdominal surgery is very extensive The most complete lists will be found in Olshausen's "Die Krankheiten der Ovarien," in *Die deutsche Chirurgie*, 1886, and in Hart and Barbour's *Manual of Gynæcology*

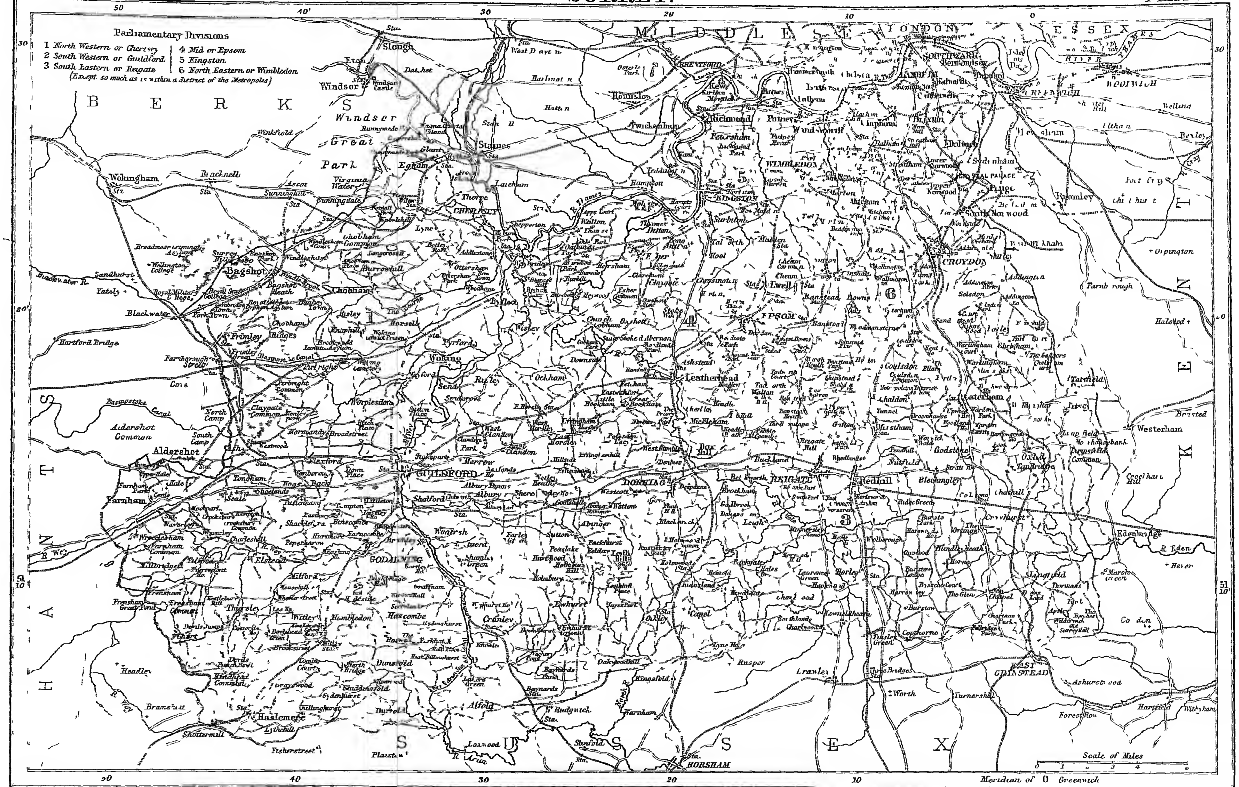
Knock knee, &c. which bones may be divided, other deformities, such as knock knee or *genu valgum* and bow leg or *genu varum*, have been remedied by operation. Drs Macewen of Glasgow, Ogston of Aberdeen, Schede of Hamburg, and the present writer have been working at this subject and have devised, more especially in knock knee, various methods of remedying the deformity. Operations are only justifiable when the deformity has become chronic. During the advancing stage, when the deformity is getting worse, when the bones are still cartilaginous and plastic, the evil can be remedied by mechanical means. This statement may be best illustrated by a short consideration of the development of the lower limbs and the changes which normally take place. At birth all children are more or less bandy legged. The child lies on its nurse's knee with the soles of the feet facing one another, the tibiæ and femora are curved outwards, and, if the limbs are extended, although the ankles are in contact, there is a distinct space between the knee joints. During the first year of life a gradual change takes place. The knee joints approach one another, the femora slope downwards and inwards towards the knee joints, the tibiæ become straight, and the sole of the foot faces almost directly downwards. While these changes are occurring, the bones, which at first consist principally of cartilage, are gradually becoming ossified, and in a normal child by the time it begins to walk the lower limbs are prepared, both by their general direction and by the rigidity of the bones which form them, to support the weight of the body. If, however, the child attempts either as the result of imitation or from encouragement to walk before the normal bandy condition has passed off, the result will necessarily be either an arrest in the development of the limbs or an increase of the bandy condition. If the child is weakly, either rachitic or suffering from any ailment which prevents the due ossification of the bones, or is improperly fed, the bandy condition may remain persistent. As a rule, however, in children that are precocious as regards walking, if proper care is taken the bandy condition will disappear without any special treatment. In a healthy child who does not attempt to walk until the limbs are prepared to support the weight of the body, no further abnormal change takes place. But in a weakly child in whom the development already described has occurred, in whom the limbs as regards their general direction are prepared for the support of the body, but in whom the bones forming the limbs are not sufficiently ossified, as in the rachitic child, the shafts of the femora above the knee and the shafts of the tibiæ below the knee bend forwards, at the same time a change takes place at the knee joint,—the condition called *knock knee*. In the normal limbs, the tibiæ being vertical and parallel, and the distance between the upper extremities of the femora being greater than that between their lower extremities, the femora necessarily slope inwards towards the middle line, and there is therefore in every properly developed person an angle at the knee joint. If at this stage the bones are sufficiently rigid to bear the weight of the patient, no further change takes place, but, if the limbs give way and are not sufficiently strong, the normal angle at the knee joint increases and the internal lateral ligament of the knee joint becomes stretched,—the result being knock-knee. The condition may be arrested in its earliest stage by an improvement in the general health of the child, but, if no such improvement takes place, and if the child is allowed to walk, then definite changes occur in the bones which form the knee joint. These changes are the direct outcome of a general law, namely, that diminished pressure results in increased growth, increased pressure in diminished growth. The best example of the former principle is the rapid growth that takes place in a child that is confined to bed during a prolonged illness. The distorted, stunted, shortened, and fashionable foot of the Chinese lady is an example of the latter. In the knee joint there is diminished pressure between the internal condyle of the femur and the inner condyle surface of the tibia, there is increased pressure between the external condyle of the femur and the outer condyle surface of the tibia. The result is an increased growth of the internal and a diminished growth of the external condyles, the knock kneed condition is intensified, and will go on as long as the primary cause is at work, getting worse and worse, and will only cease when the bones become fully developed. As long as the disease is getting worse, the application of a rigid splint to the outer side of the limb fixed at the foot and at the upper part of the thigh, and the arrangement of an elastic bandage so as to draw the limb towards the splint, the person being kept in the horizontal posture, will cause a diminution in the pressure on the external condyles followed by their increased growth, and by an increased pressure on the internal condyles followed by a diminished growth. This effect may be obtained by applying a weight to the limb, and by mechanical means founded on this general law cases of knock knee that are getting worse can be improved. At first there is an arrest in the abnormality, which is soon followed by improvement. The different methods that have been recommended for division of the bones are only necessary in those cases in which they have become permanently distorted.

(3) Lateral curvature of the spine is a deformity which occurs Spinal curvature. during the developing period of life before the bodies of the vertebræ are fully ossified. In young people who are growing rapidly, and whose muscular system is weak, any bad habit, as, for example, that of standing and throwing the weight of the body constantly on one leg, gives rise to a drooping of the pelvis on one side, or, if, when writing at a desk, they are allowed to sit in a twisted position, a lateral curvature of the spine takes place. By constant indulgence in these bad habits the cartilaginous spinal column gets set in an abnormal direction. In the concavity of the curve there is increased pressure and necessarily diminished growth, in the convexity of the curve diminished pressure with increased growth. The patient's friends will probably notice first the right scapula being pushed backwards by the underlying ribs, which from their close attachment to the dorsal vertebræ participate in a rotatory movement occurring in the vertebræ themselves, and, unless means are taken to alter the abnormal distribution of pressure, the condition will become worse and worse, until complete ossification checks the progress of the deformity. The commonest curvature is one in which there is a dorsal convexity towards the right, with the right shoulder higher than the left. Compensatory curves in the opposite direction form in the lumbar and cervical regions. Along with the lateral curvation a rotation of the bodies of the vertebræ towards the convexity of the curve takes place, their spinous processes necessarily turn towards the concavity of the curve. Since the line of the spinous processes of the vertebræ can be easily traced through the skin, their deviation may mislead the superficial observer as to the true direction in which curvature has taken place. As the lateral curvation occurs the articular facets along the line of the concavity are pressed together, the line of these facets being posterior to the bodies of the vertebræ and their intervening elastic intervertebral disks. The result of this is that the vertebral column as a whole cannot fly away towards the convexity. The anterior parts of the bodies, being farthest away from the fixed point, are least restrained from movement, and they pass away to a greater extent than the posterior parts. The result is a rotation of each vertebra in the direction indicated. To counteract this deformity in the earliest stages, the patient (generally a girl) should be encouraged to walk about with a book on her head, to retain which in position she must necessarily keep perfectly erect. Muscular exercises, to strengthen the muscles of the back, ought to be enjoined and superintended by the surgeon. During the intervals of rest she should lie upon her back on a firm board, and should carefully avoid taking any exercise which gives rise to weariness of the muscles, for, whenever the muscles become wearied, she will attempt to take up a position which throws the strain off them on to her ligamentous and bony structures. One of the best exercises is to lay the patient on her face, fix her feet, and encourage her to raise herself by using the muscles of the back. When the deformity becomes more marked the use of the trapeze should be prescribed. Hanging with her arms upon the trapeze, the weight of the lower limbs and pelvis will tend to straighten the spine as a whole, necessarily diminishing the increased pressure upon the cartilaginous bodies of the vertebræ towards the concavity, and increasing the pressure between the sides of the bodies towards the convexity. The tendency to rotation must be counteracted in another way. The pelvis being fixed, elastic bands attached to fixed points, one in front of the patient towards her left side, another behind her towards her right side, are to be grasped by her right and left hands respectively, the right arm passing in front of her body, the left arm behind it. When the patient stretches both hands simultaneously there will be an untwisting of the spine in a direction opposite to the abnormal rotation. In this description, the common curvature—namely, of the dorsal region towards the right—has been taken as a typical example to illustrate the treatment. When the dorsal curve is in the opposite direction, the untwisting of the curve must necessarily be in the opposite direction also. During the intervals of active treatment the patient must wear a rigid support, which in itself has no direct curative action, but will materially assist the treatment by preventing the good result obtained by the muscular exercises from being nullified. (J. C.)

SURINAM. See GUIANA, DUTCH, vol. xi. p. 251.

SURRENDER is a mode of alienation of real estate. It is defined by Lord Coke to be "the yielding up of an estate for life or years to him that hath an immediate estate in reversion or remainder" (Coke upon Littleton, 337b). It is precisely the converse of release, which is a conveyance by the reversioner or remainderman to the tenant of the particular estate. A surrender is the usual means of effecting the alienation of copyholds. The surrender is made to the lord, who grants admittance to the

SURREY.



J Bartholomew

purchaser, an entry of the surrender and admittance being made upon the court rolls Formerly a devise of copyholds could only have been made by surrender to the use of the testator's will, followed by admittance of the devisee The Wills Act of 1837 now allows the devise of copyholds without surrender, though admittance of the devisee is still necessary A surrender must since 8 and 9 Vict c 106 be by deed, except in the case of copyholds and of surrender by operation of law Surrender of the latter kind generally takes place by merger, that is, the combination of the greater and less estate by descent or other means without the act of the party It has been dealt with by recent legislation (see REMAINDER) In Scotch law surrender in the case of a lease is represented by renunciation The nearest approach to surrender of a copyhold is resignation *in remanentiam* (to the lord) or resignation *in favorem* (to a purchaser) These modes of conveyance are now practically superseded by the simpler forms introduced by the Conveyancing Act, 1874

Plate X SURREY, a metropolitan county of England, is bounded north by the Thames, which separates it from Berks and Middlesex, east by Kent, south by Sussex, and west by Hampshire Owing to the fact that it includes a portion of London, it ranks fourth among the counties of England in point of population, but in point of size it is only the thirtieth, the total area being 485,129 acres, or 758 square miles

The geological structure of Surrey is reflected in its varied and picturesque scenery, the charms of which are enhanced by the large proportion of ground still remaining uncultivated The extent of common land is also very great, a circumstance which, from its proximity to London, must be considered as specially fortunate The northern portion of the county, in the London basin, belongs to the Eocene formation the lower ground is occupied chiefly by the London clay of the Lower Eocene group, stretching (with interruptions) from London to Farnham, this is fringed on its southern edge by the plastic clays or Woolwich beds of the same group, which also appear in isolated patches at Headley near Leatherhead, and the Thanet sands of the same group crop out under the London clay between Beddington, Banstead, and Leatherhead The north-western portion of the county, covered chiefly by heath and Scotch fir, belongs to the Middle Eocene group, or Bagshot sands the Fox Hills and the bleak Chobham Ridges are formed of the upper series of the group, which rests upon the middle beds occupying the greater part of Bagshot Heath and Bisley and Pirbright Commons, while eastwards the commons of Chobham, Woking, and Esher belong to the lower division of the group To the south of the Eocene formations the smooth rounded outlines of the chalk hills extend through the centre of the county from Farnham to Westerham (Kent) From Farnham to Guildford they form a narrow ridge called the Hog's Back, about half a mile in breadth with a high northern dip, the greatest elevation reached in this section being 505 feet East of Guildford the northern dip decreases, and the outcrop widens, throwing out picturesque summits, frequently partly wooded, and commanding widely variegated views, the highest elevation being Botley Hill near Titsey, 866 feet. The Upper Greensand or grey chalk marl, locally known as firestone, crops out underneath the Chalk along the southern escarpment of the Downs, and the Gault, a dark blue marl, rests beneath the Upper Greensand in the bottom of the long narrow valley which separates the chalk Downs from the well-marked Lower Greensand hills Leith Hill of this formation reaches a height of 967 feet, and from its isolated position commands one of the finest views in the south of England, the next highest summits being Hindhead Hill (894 feet) and Holmbury Hill (857 feet) The southern part of the county belongs to the Wealden formation of freshwater origin the lower strata or Hastings beds occupy a small portion at the south-eastern corner, but the greater part consists of a blue or brown shaly clay, amid which are deposited river shells, plants of tropical origin, and reptilian remains

The whole of the county north of the Downs is in the basin of the Thames Besides a number of smaller streams, its chief affluents from Surrey are the Wey at Weybridge, the Mole at East Moulsey, and the Wandle at Wandsworth The Eden, a tributary of the Medway, takes its rise in the south-east corner of Surrey

According to the agricultural returns for 1886, of the total area of the county 299,034 acres were under cultivation, 77,553 being under corn crops, 44,998 under green crops, 26,741 rotation grasses, 138,117 permanent pasture, 2547 hops, and 9078 fallow There are considerable varieties of soil, ranging from plastic clay to calcareous earth and bare rocky heath The plastic clay is well adapted for wheat, the most largely grown of the corn crops, occupying 29,694 acres in 1886, while barley, oats, and pease, which grow well on the loamy soils in different parts of the county, occupied respectively 15,439, 24,705, and 4587 acres, beans occupying 1872 and rye 1256 Of green crops there were 6432 acres under potatoes, 15,975 under turnips and swedes, 9995 mangolds, 860 carrots, 2660 cabbage, kohl rabi, and rape, and 9076 vetches and other green crops A considerable proportion of the area under green crops is occupied by the market gardens on the alluvial soil along the banks of the Thames, especially in the vicinity of London The total area of nursery grounds in 1886 was 1466, and of market gardens 2953 acres In early times the market gardeners were Flemings, who introduced the culture of asparagus at Battersea and of carrots at Chertsey, for which this district is still famous The area under orchards in 1886 was 2144 acres Rhododendrons and azaleas are largely grown in the north-western district of the county In the neighbourhood of Mitcham various medicinal plants are extensively cultivated for the London herb-sellers and druggists, such as lavender, mint, camomile, anise, rosemary, liquorice, hyssop, &c The calcareous soil in the neighbourhood of Farnham is well adapted for hops, but this crop in Surrey is of minor importance There is a considerable area under wood (42,974 acres in 1881) Oak, chestnut, walnut, ash, and elm are extensively planted, alder and willow plantations are common, and the Scotch fir propagates naturally from seed on the commons in the north-west of the county The extent of pasture land is not great, with the exception of the Downs, which are chiefly occupied as sheep-runs Dairy-farming is a more important industry than cattle feeding, large quantities of milk being sent to London The number of horses in 1886 was 9930, of which 3273 were unbroken horses and mares kept solely for breeding, of cattle 49,986, of which 24,869 were cows and heifers in milk or in calf and 8699 other cattle two years old and above, of sheep 87,658, and of pigs 25,172

According to the latest (1873) landowners *Return* for England, Surrey was divided among 17,293 proprietors possessing 398,746 acres at an annual value of £2,285,814, in addition to which there were 40,037 acres of common lands Of the proprietors 12,712, or nearly two thirds, possessed less than one acre each, the total which they owned being 2861 acres The average annual rental per acre of the land all over was about £5, 14s 9d The following proprietors held over 5000 acres each —earl of Lovelace, 9958, crown, 7496, earl of Onslow, 6563, Sir W R Clayton, 6505, G W G Leveson-Gower, 6368

Manufactures —The more important manufactures are chiefly confined to London and its immediate neighbourhood (see LONDON, vol xiv p 832) There are paper mills at Wandsworth, and along the valley of the Wandle there are snuff, drug, and copper mills Calico bleaching and printing are carried on to a small extent in the same valley, and there are also a few silk mills and tanneries Ropes, snuff, and drugs are likewise manufactured along the banks of the Mole Woollen goods and hosiery are made at Godalming, and gunpowder is largely manufactured at Chilworth

Communication —In addition to the navigation by barges, steamers ply on the Thames as far as Hampton The Basingstoke Canal from Basingstoke to the Wey at Weybridge crosses the north-west corner of the county, and the Surrey and Sussex Canal passes southwards from the Wey near Guildford to the Arun Surrey is more completely supplied by railways than any other county in England, the London, Chatham, and Dover, the South-Eastern, the London, Brighton, and South Coast, and the London and South-Western Railways intersecting it by their main lines as well as by various branches

Administration and Population —Surrey contains 14 hundreds, the borough of Southwark (pop 221,946), which has no municipal government, but for certain purposes is connected with the city of

London, and the municipal boroughs of Godalming (2505), Guildford (10,858), Kingston upon Thames (20,648), and Reigate (18,662). A considerable portion (22,472 acres, with a population in 1881 of 980,522) is within the metropolitan district of London, in addition to which there are the following urban sanitary districts—Aldershot (20,155), Croydon (78,953), Dorking (6328), East Moulsey (3289), Epsom (6916), Farnham (4488), Ham Common (1349), Hampton Wick (2164), New Malden (2538), Richmond (19,066), Surbiton (9406), Teddington (6599), and Wimbledon (15,950). The county has one court of quarter sessions, and is divided into twelve petty and special sessional divisions. The central criminal court has jurisdiction over certain parishes in this county. The borough of Guildford has a separate court of quarter sessions and commission of the peace, the boroughs of Reigate and Kingston-upon-Thames have commissions of the peace, the borough of Southwark is included in the petty sessional division of Newington, and the borough of Godalming, in which the mayor and ex-mayor are magistrates, forms part of the petty sessional division of Guildford, the county justices having concurrent jurisdiction. The county contains 152 civil parishes, with parts of two others. It is shared among the dioceses of Canterbury, Rochester, and Winchester. Until 1885 the county for parliamentary purposes was divided into East, Mid, and West Surrey; it is now rearranged in six divisions, viz., Kingston, Mid (Epsom), North-East (Wimbledon), North-West (Chertsey), South East (Reigate), and South West (Guildford). The portion of Surrey formerly included in the borough of Greenwich was in 1885 included in the borough of Deptford (Kent), the borough of Guildford was disfranchised, one member was given to Croydon, and instead of the two metropolitan boroughs of Lambeth and Southwark the following fifteen constituencies (each returning one member) were created:—Battersea and Clapham, constituting two divisions; Camberwell, embracing the divisions of North Camberwell, Dulwich, and Peckham; Lambeth, embracing the divisions of Brixton, Kennington, Lambeth North, and Norwood; Southwark, containing the divisions of Bermondsey, Rotherhithe, and Southwark West; Wandsworth, and Newington, with the divisions of Walworth and West Newington.

Since the beginning of the 19th century the population has increased nearly 600 per cent. From 268,233 in 1801 it had increased by 1821 to 399,417, by 1851 to 683,082, by 1871 to 1,091,635, and by 1881 to 1,436,899, of whom 683,228 were males and 753,671 females. The number of persons to an acre is 2.96 and of acres to a person 0.34. Within the last decade the increase has been 35.1 per cent.,—much greater than the increase in the general town population of England and Wales, which was 19.63 per cent., the increase in the whole population being only 14.34. Nearly two-thirds (980,522) of the population belong to the metropolitan district of London, but the suburbs of London extend practically throughout the greater part of the county, its increase in population being chiefly due to the building of residences for those who have business or professional interests in London.

History and Antiquities.—Notwithstanding its proximity to London, Surrey has been associated with few great events in English history. Roman remains have been discovered at Albury, Kingston, Titsey, Woodcote, and a few other places, but none are of much importance. On several of the hills there are remains of camps of either Roman or British origin. The Roman Stane Street from London to Chichester in Sussex passed by Kingston, Chessington, Leatherhead, Dorking (where its remains are specially well marked), Leith Hill, and Ockley. During the Saxon period Surrey was included in the dominions of the South Saxons and afterwards of Wessex. Its name Surrey or "south kingdom" has apparently reference to its position south of London or south of the Thames. Kingston in Surrey was in 838 the seat of a witanagemot convened by Egbert, and after the capture of Winchester by the Danes it was from 901 to 978 the place where the Anglo-Saxon kings were crowned. Surrey was an earldom of Godwine, and after the conquest was bestowed on William de Warren, who had married Gundrada, supposed to have been a daughter of the Conqueror. From the time that the great charter was on 15th June 1215 signed by King John at Runnymede near Egham the historical annals of the county are a blank, until the period of the Civil War, when a skirmish took place, 7th June 1648, at Kingston.

The only ecclesiastical ruins worthy of special mention are the picturesque walls of Newark Priory, founded for Augustinians in the time of Richard Cœur de Lion, and the Early English crypt and part of the refectory of Waverley Abbey, the earliest house of the Cistercians in England, founded in 1128 by William Gifford, bishop of Winchester. The *Annales Waverlienses*, published by Gale in his *Scriptores* and afterwards in the Record series of *Chronicles*, are supposed to have suggested to Sir Walter Scott the name of his first novel. The church architecture is of a very varied kind, and has no peculiarly special features. Among the more interesting churches are Albury, the tower of which is of Saxon or very early Norman date; Beddington, a fine example of the Perpendicular, and containing monuments of the Carew family; Chaldon, remarkable for its fresco wall-paintings of the 12th century, discovered during restoration in 1870; Compton, which, though mentioned in Domesday, possesses little of its original architecture, but is worthy of notice for its two storied chancel, and its carved wooden balustrade surmounting the pointed Transition Norman arch which separates the nave from the chancel; St Mary's, Guildford, containing examples of Norman, Early English, Decorated, and Perpendicular, but is of interest chiefly for the grotesque carving on the corbels of the aisles and the coloured medallions on the roof of the north chapel; Leigh, Perpendicular, possessing some very fine brasses of the 15th century; Lingfield, Perpendicular, containing ancient tombs and brasses of the Cobhams; Ockham, chiefly Decorated, with a lofty embattled tower, containing the mausoleum of Lord Chancellor King (d. 1734), with full-length statue of the chancellor by Rysbroeck; Reigate, chiefly Perpendicular, but with Transition Norman pillars in the nave; Stoke d'Abernon, Early English, with the earliest extant English brass, that of Sir John d'Abernon, 1277; and Woking, Decorated, with Early English chancel. Of old castles the only examples are Farnham, occupied as a palace by the bishops of Winchester, originally built by Henry of Blois, and restored by Henry III., and Guildford, with a strong quadrangular Norman keep. Ancient domestic architecture is, however, well represented, the examples including Beddington Hall, now a female orphan asylum, the ancient mansion of the Carews, rebuilt in the reign of Queen Anne, but still retaining the hall of the Elizabethan building; Crowhurst Place, built in the time of Henry VII., the ancient seat of the Gaynesfords, and frequently visited by Henry VIII.; portions of Croydon Palace, an ancient seat of the archbishops of Canterbury; the gate tower of Esher Place, built by William of Waynflete, bishop of Winchester, and repaired by Cardinal Wolsey; Archbishop Abbot's hospital, Guildford, in the Tudor style; the fine old Elizabethan house of Losely near Guildford; Cowley House, Chertsey, originally of the time of James I., inhabited by the poet Cowley from the Restoration till his death; Smallfield Place, now a farmhouse, at one time the seat of Sir Edward Bysshe, garter king at-arms; and Sutton Place, dating from the time of Henry VIII., possessing curious mouldings and ornaments in terra-cotta. Among the eminent persons specially connected with Surrey may be mentioned George Abbot, archbishop of Canterbury, the son of a cloth worker in Guildford; Arthur Onslow, born at Merrow in 1691, who became member for Guildford and speaker of the House of Commons; Sir William Temple, who had his residence at Moor Park, where he died in 1699; Sir Nicolas Carew, beheaded for conspiracy in 1539, and other members of the family, who had their ancestral seat at Beddington; John Evelyn, the diarist, who was born at Wotton in 1620; Malthus, the political economist, who was born at the Rooke, near the same place, in 1766; William Cobbett, who was born near Farnham in 1762; Horne Tooke, who was born at Westminster, wrote his well-known book at Purley, and died at Wimbledon in 1812; the historian Gibbon, who was born at Putney in 1737, which was also the birthplace of Cromwell, the minister of Henry VIII.

SURREY, HENRY HOWARD, EARL OF (1516?-1547), one of the leaders in the poetic movement under Henry VIII. that heralded the great outburst of the Elizabethan period. Of his personal life outside his poetry only the barest outline is known, and till comparatively of late even that outline was not free from confusion. Three different men—the grandfather of the poet, his father, and the poet himself—bore the title within a period of ten or eleven years, and at one time the poet was confounded with his grandfather, and supposed to have been present at the battle of Flodden (1513). He was not born till at least two years after that event. It was his grandfather who distinguished himself at Flodden under the title of the earl of Surrey, and was created duke of Norfolk as a reward for his services, surrendering the title of Surrey to his son, the poet's father, for his lifetime. Although the poet has always been most familiarly known as the earl of Surrey, he really held the title only by courtesy, succeeding to it on that footing in 1524, when his father became duke of Norfolk. In one of his poems he speaks of having passed "his childish years" at Windsor "with a king's son." This was Henry VIII.'s natural son, Henry Fitzroy, duke of Richmond, who was affianced to Surrey's sister, Mary, but died before he was out of his teens. It is

sometimes said that the two were educated together at Windsor, but the sweet companionship to which the poem refers, when the two youths "hoved" in the large green courts "with eyes cast up into the maiden's tower," belongs to the last year of Fitzroy's short life Whether or not Surrey was educated from literal childhood with a king's son, he was certainly educated with the care for literary culture which about that time became common in the households of English noblemen, and, as the fashion was, he was sent, after passing through Cambridge, to complete his education in Italy The tradition that he made the tour of Europe as a knight-errant, upholding against all comers the superiority of his mistress Geraldine, has no extrinsic evidence in its favour If Geraldine was, as is commonly supposed, Elizabeth Fitzgerald, a daughter of the earl of Kildare, she was but a child of seven or eight years when Surrey set out on his travels The legend about his knight-errantry is probably only a sign of the extent to which his chivalrous personality and poetry fascinated the imagination of his own and the next generation The eminence of the Howards at Henry's court was evidenced in many ways · in the festivities at the king's marriage with Anne of Cleves, Surrey was the leader of one of the sides at the tournament, and two years later his cousin, Catherine Howard, became the king's fifth wife Surrey took an active part in the insignificant wars of Henry's later years, accompanied the expedition, led by his father, which ravaged the south of Scotland in 1542, and held a command in the French expedition of 1544 When the king's death was known to be near, the duke of Norfolk was suspected of aiming at the throne, and Surrey's own haughty and ostentatious manners countenanced the suspicion A month before the king's death both were arrested and lodged in the Tower, and on 13th January 1547 Surrey was brought to trial for high treason The main charge against him was that he had "falsely, maliciously, and treacherously set up and borne the arms of Edward the Confessor" His plea that the arms belonged to his ancestors was probably not accepted as an extenuation of the offence A common jury found him guilty, and he was executed on Tower Hill on 19th January

His poems, which had been one of the occupations of his crowded life, first appeared in print in *Tottel's Miscellany* in 1557 On the title-page of this memorable publication Surrey's name stood first, but this was probably in deference to his rank, Wyatt was the first in point of time of Henry's "courtly makers" (see WYATT) Surrey, indeed, expressly acknowledges Wyatt, who was several years his senior, as his master in poetry Seeing, however, that their poems were first published in the same volume, many years after the death of both, their names can never be disassociated, and it must always be hard to say which was the leader in the various new and beautiful forms of verse which *Tottel's Miscellany* introduced into English poetry Surrey's only unquestionable distinction as a metrician lies outside the *Miscellany* his translation of the second and fourth books of the *Æneid* into blank verse —the first attempt at blank verse in English—was published separately by Tottel in the same year But his sonnets (in various schemes of verse), his elegy on the death of Wyatt (in elegiac staves shut in by a final couplet), his pastoral poem (a lover's complaint put into the mouth of a shepherd), and his lyrics in livelier measures are all extremely interesting experiments, and served as models for more than one generation of courtly singers and sonneteers In form as well as in substance Surrey and his compeers were largely indebted to Italian predecessors, most of his poems are in fact translations or adaptations of Italian originals The tone of the love sentiment was new in English poetry, very different in its earnestness, passion, and fantastic extravagance from the lightness, gaiety, and humour of the Chaucerian school In this respect *Tottel's Miscellany* helped to educate the English muse for the triumphs of the tragic drama Surrey's own contributions are distinguished by their copious and impetuous eloquence and sweetness

SURROGATE is a deputy of a bishop or an ecclesiastical judge, acting in the absence of his principal, and strictly bound by the authority of the latter At present the chief duty of a surrogate is the granting of marriage licences Quite recently judgments of the arches court of Canterbury have been delivered by a surrogate The office is unknown in Scotland, but is of some importance in the United States In the State of New York the surrogate's court is a court of record, with jurisdiction over the administration of the personal estate of a deceased person and certain other matters In New Jersey the surrogate is an official of the orphans' court, grants unopposed probates, &c

SURVEYING

SURVEYING is the art of determining the relative positions of prominent points and other objects on the surface of the ground and making a graphical delineation of the included area The general principles on which it is conducted are in all instances the same certain measures are made on the ground and corresponding measures are protracted on paper, on a scale which is fixed at whatever fraction of the natural scale may be most appropriate in each instance The method of operation varies with the magnitude and importance of the survey, which may embrace a vast empire or be restricted to a small plot of land All surveys rest primarily on linear measures for direct determinations of distance, but these are usually largely supplemented by angular measures, to enable distances to be deduced by the principles of geometry which cannot be conveniently measured over the surface of the ground where it is hilly or broken The nature of a survey depends on the proportion which the linear and the angular measures bear to each other, it may be purely linear or even purely angular, but is generally a combination of both methods Thus in India there are numerous instances of large tracts having been surveyed by the purely linear method, in the course of the revenue surveys which were initiated by the native Governments The operations were conducted by men who had no knowledge of geometry or of any other measuring instrument than the rod or chain, and whose principal object was the determination of fairly accurate areas, their methods sufficed for this purpose and were accepted and perpetuated for many years by the European officers to whom the revenue assessments became entrusted after the subversion of the native rule In India, too, there are extensive tracts of country which have been surveyed by the purely angular method, either because the ground did not permit of the chain being employed with advantage, as in the Himalayan mountains and hill tracts generally, or because the chain was considered politically objectionable, as in native states where it would have been regarded with suspicion

Surveys of any great extent of country were formerly constructed on a basis of points whose positions were fixed astronomically, and in some countries this method of operation is still of necessity adopted But points whose relative positions have been fixed by a triangulation of moderate accuracy present a more satisfactory and reliable basis, for astronomical observations are liable, not only to the well-known intrinsic errors which are caused by uncertainties in the catalogued places of the moon and stars, but to external errors arising from deflexions of the plumb line under the influence of local attractions, and these of themselves materially exceed the errors which would be generated in a fairly executed triangulation of a not excessive length, say not exceeding 500 miles The French Jesuits who made a survey of China for the emperor about 1730 appear to have been the first deliberately to discard

the astronomical and adopt the trigonometrical basis In India the change was made in 1800, when what is known as the Great Trigonometrical Survey was initiated by Major Lambton—with the support of Colonel Wellesley, afterwards Duke of Wellington—as a means of connecting the several surveys of routes and districts which had already been made in various parts of the country, and as a basis for future topography This necessitated the inception of the survey as an undertaking calculated to satisfy the requirements of geodesy as well as geography, because the latitudes and longitudes of the points of the triangulation had to be determined for future reference,—as in the case of the discarded astronomical stations, though in a different manner,—by processes of calculation combining the results of the triangulation with the elements of the earth's figure The latter were not then known with much accuracy, for so far geodetic operations had been mainly carried on in Europe, and additional operations nearer the equator were much wanted, the survey was conducted with a view to supply this want Thus a high order of accuracy was aimed at from the very first In course of time the operations were extended over the entire length and breadth of Hindustan and beyond, to the farthest limits of British sway, they cover a larger area than any other national survey as yet completed, and are very elaborate and precise Thus, as triangulation constitutes the most appropriate basis for survey operations generally, a short account will be given of (1) the methods of the Great Trigonometrical Survey of India This will be followed by accounts of (2) traversing as a basis for survey, (3) levelling, (4) survey of interior detail, (5) representation of ground, (6) geographical reconnaissance, (7) nautical surveying, (8) mapping, (9) map printing, (10) instruments

I Great Trigonometrical Survey of India

General outlines

1 *General Outlines* —Primarily a network was thrown over the southern peninsula The triangles on the central meridian were measured with extra care and checked by base-lines at distances of about 2° apart in latitude in order to form a geodetic arc, with the addition of astronomically determined latitudes at certain of the stations The base-lines were measured with chains and the principal angles with a 3-foot theodolite, which, however, was badly damaged almost at the outset by an accident to the azimuthal circle The signals were cairns of stones or poles The chains were somewhat rude and their units of length

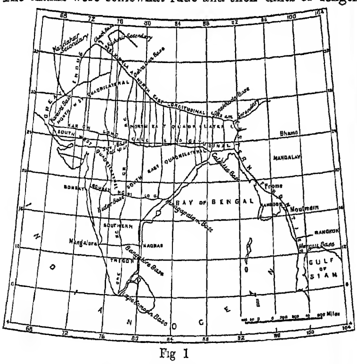

Fig 1

had not been determined originally, and could not be afterwards ascertained The results were good of their kind and sufficient for geographical purposes, but the central meridional arc—the "great arc"—was eventually deemed inadequate for geodetic requirements A superior instrumental equipment was introduced, with an improved *modus operandi*, under the direction of Colonel Everest in 1832 The network system of triangulation was superseded by meridional and longitudinal chains taking the form of gridirons, and resting on base-lines at the angles of the gridirons, as represented in fig 1 For convenience of reduction and nomenclature the triangulation west of meridian 92° E has been divided into five sections,—the lowest a trigon, the other four quadrilaterals distinguished by cardinal points which have reference to an observatory in Central India, the adopted origin of latitudes In the north-east quadrilateral, which was first measured, the meridional chains are about one degree apart, this distance was latterly much increased, and eventually certain chains—as on the Malabar coast and on meridian 84° in the south-east quadrilateral—were dispensed with, because good secondary triangulation for topography had been accomplished before they could be commenced

Base-lines

2 *Modern Base-Lines* —All these were measured with the Colby apparatus of compensation bars and microscopes The bars, 10 feet long, were set up horizontally on tripod stands, the microscopes, 6 inches apart, were mounted in pairs revolving round a vertical axis and were set up on tribrachs fitted to the ends of the bars Six bars and five central and two end pairs of microscopes—the latter with their vertical axes perforated for a look-down telescope—constituted a complete apparatus, measuring 63 feet between the ground pins or registers For explanation of compensation see Earth, Figure of the, vol vii p 599 Compound bars are necessarily more liable to accidental changes of length than simple bars, they were therefore tested from time to time by comparison with a standard simple bar, the microscopes were also tested by comparison with a standard 6-inch scale At the very first base-line the compensated bars were found to be liable to sensible variations of length with the diurnal variations of temperature, these were supposed to be due, not to error in effecting the compensation, but to the different thermal conductivities of the brass and the iron components It became necessary, therefore, to determine the mean daily length of the bars very precisely, for which reason they were systematically compared with the standard before and after, and sometimes at the middle of, the base-line measurement throughout the entire day for a space of three days, and under conditions as nearly similar as possible to those obtaining during the measurement Eventually thermometers were applied experimentally to both components of a compound bar, when it was found that the diurnal variations in length were principally due to difference of position relatively to the sun, not to difference of conductivity,—the component nearest the sun acquiring heat most rapidly or parting with it most slowly, notwithstanding that both were in the same box, which was always kept under the cover of a tent and carefully sheltered from the sun's rays Happily the systematic comparisons of the compound bars with the standard were found to give a sufficiently exact determination of the mean daily length An elaborate investigation of theoretical probable errors at the Cape Comorin base showed that, for any base-line measured as usual without thermometers in the compound bars, the *p e* may be taken as $\pm$ 1·5 millionth parts of the length, excluding unascertainable constant errors, and that on introducing thermometers into these bars the *p e* was diminished to $\pm$ 0 55 millionths

In all base-line measurements the weak point is the determination of the temperature of the bars when that of the atmosphere is rapidly rising or falling, the thermometers acquire and lose heat more rapidly than the bar if

their bulbs are outside, and more slowly if inside the bar Thus there is always more or less lagging, and its effects are only eliminated when the rises and falls are of equal amount and duration, but as a rule the rise generally predominates greatly during the usual hours of work, and whenever this happens lagging may cause more error in a base-line measured with simple bars than all other sources of error combined In India the probable average lagging of the standard-bar thermometer was estimated as not less than 0° 3 Fahr, corresponding to an error of – 2 millionths in the length of a base-line measured with iron bars With compound bars lagging would be much the same for both components and its influence would consequently be eliminated Thus the most perfect base-line apparatus would seem to be one of compensation bars with thermometers attached to each component, then the comparisons with the standard need only be taken at the times when the temperature is constant, and there is no lagging

Expansion of standard bar

3 *Factor of Expansion of Standard Bar*—This was first determined in 1832 by measuring the increment in length between temperatures of 76° and 212° Fahr, in 1870 the increment between 52° and 96° was measured, the results indicated an increase of expansion with temperature They were therefore combined on the empirical assumption that the expansion is the sum of two terms,—the first x times the temperature, the second y times the square of the temperature, x and y were then determined from the two equations of condition given by the two sets of measurements The resulting value of the expansion at 62° was found to be 5 per cent less than the previously derived value at the mean temperature of 144°, thus showing the importance of employing a factor varying with the mean temperature of each base-line, and this was done in the final reductions

Plan of triangulation

4 *Plan of Triangulation*—This was broadly a system of internal meridional and longitudinal chains with an external border of oblique chains following the course of the frontier and the coast lines The design of each chain was necessarily much influenced by the physical features of the country over which it was carried The most difficult tracts were plains of great extent, devoid of any commanding points of view, in some parts covered with dense forest and jungle, malarious and deadly, and almost uninhabited, in other parts covered with towns and villages and umbrageous trees,—the adjuncts and concomitants of a teeming population In such tracts triangulation was impossible except by constructing lofty towers as stations of observation, raising them to a sufficient height to overtop at least the earth's curvature, and then either increasing the height to surmount all obstacles to mutual vision, or clearing the lines, both of which were laborious and expensive processes Thus in hilly and open country the chains of triangles were generally made "double" throughout, *i e*, formed of polygonal and quadrilateral figures, to give greater breadth and accuracy, but in tracts of forest and close country they were carried out as series of single triangles, to give a minimum of labour and expense Symmetry was secured by restricting the angles between the limits of 30° and 90° The average side length was 30 miles in hill country and 11 in the plains, the longest principal side was 62 7 miles, though in the secondary triangulation to the Himalayan peaks there were sides exceeding 200 miles Long sides were at first considered desirable, on the principle that the fewer the links the greater the accuracy of a chain of triangles, but it was eventually found that good observations on long sides could only be obtained under exceptionally favourable atmospheric conditions, which were of rare occurrence The sides were therefore shortened, whereby the observations were much improved and accelerated In plains the length was governed by the height to which towers could be conveniently raised to surmount the curvature, under the well-known condition, height in feet = $\frac{2}{3}$ × square of the distance in miles, thus 24 feet of height was needed at each end of a side to overtop the curvature in 12 miles, and to this had to be added whatever was required to surmount obstacles on the ground In Indian plains refraction is more frequently negative than positive during sunshine, no reduction could therefore be made for it

Sites for stations

5 *Selection of Sites for Stations*—This, a very simple matter in hills and open country, is often very difficult in plains and close country In the early operations, when the great arc was being carried across the wide plains of the Gangetic valley, which are covered with villages and trees and other obstacles to distant vision, masts 35 feet high were carried about for the support of the small reconnoitring theodolites, with a sufficiency of poles and bamboos to form a scaffolding of the same height for the observer Other masts 70 feet high, with arrangements for displaying blue lights by night at 90 feet, were erected at the spots where station sites were wanted But the cost of transport was great, the rate of progress was slow, and the results were unsatisfactory Eventually a method of touch rather than sight was adopted, feeling the ground to search for the obstacles to be avoided, rather than attempting to look over them, the "rays" were traced either by a minor triangulation, or by a traverse with theodolite and perambulator, or by a simple alignment of flags The first method gives the direction of the new station most accurately, the second searches the ground most closely, the third is best suited for tracts of uninhabited forest in which there is no choice of either line or site, and the required station may be built at the intersection of the two trial rays leading up to it As a rule it has been found most economical and expeditious to raise the towers only to the height necessary for surmounting the curvature, and to remove the trees and other obstacles on the lines

Principal stations

6 *Structure of the Principal Stations*—Each has a central masonry pillar, circular and 3 to 4 feet in diameter, for the support of a large theodolite, and around it a platform 14 to 16 feet square for the observatory tent, observer, and signallers The pillar is carefully isolated from the platform, and when solid carries the station mark—a dot surrounded by a circle—engraved on a stone at its surface, and on additional stones or the rock *in situ*, in the normal of the upper mark, but, if the height is considerable and there is a liability to deflexion, the pillar is constructed with a central vertical shaft to enable the theodolite to be plumbed over the ground-level mark, to which access is obtained through a passage in the basement In early years this precaution against deflexion was neglected and the pillars were built solid throughout, whatever their height, the surrounding platforms, being usually constructed of sun-dried bricks or stones and earth, were liable to fall and press against the pillars, some of which thus became deflected during the rainy seasons that intervened between the periods during which operations were arrested or the commencement and close of the successive circuits of triangles In some instances displacements of mark occurred of which the magnitudes were not ascertainable, but were estimated as equivalent to *p e*'s of about ± 9 inches in the length and ± 2″ 4 in the azimuth of the side between any two deflected towers, and, as these theoretical errors are identical with what may be expected at the end of a chain of 36 equilateral triangles in which all the angles have been measured with a *p e* = ± 0″ 5, the old triangulation over solid towers had evidently suffered much more from the deflexions of the towers than from errors in the measurements of the angles

7. *Instruments for Measuring Principal Angles*.—Large theodolites were invariably employed. Repeating circles were highly thought of by French geodesists at the time when the operations in India were being commenced, but they were not used in the survey, and have now been generally discarded.

Theodolites. The principal theodolites are somewhat similar to the astronomer's alt-azimuth instrument, but with larger azimuthal and smaller vertical circles, also with a greater base to give the firmness and stability which are required in measuring horizontal angles. The azimuthal circles have mostly diameters of either 36 or 24 inches, the vertical circles having a diameter of 18 inches. In all the theodolites the base is a tribrach resting on three levelling foot screws, and the circles are read by microscopes; but in different instruments the fixed and the rotatory parts of the body vary. In some the vertical axis is fixed on the tribrach and projects upwards, in others it revolves in the tribrach and projects downwards. In the former the azimuthal circle is fixed to the tribrach, while the telescope pillars, the microscopes, the clamps, and the tangent screws are attached to a drum revolving round the vertical axis; in the latter the microscopes, clamps, and tangent screws are fixed to the tribrach, while the telescope pillars and the azimuthal circle are attached to a plate fixed at the head of the rotatory vertical axis. The former system—called that of *flying microscopes*—permits the vertical axis to be readily opened out and cleaned, and presents the same clamp and tangent screw for employment during a round of angles; the latter—the system of *fixed microscopes*—necessitates the removal and replacement of all the microscopes, clamps, and tangent screws whenever the axis is cleaned, which is very troublesome, and it presents three sets of clamps and tangent screws for successive employment during a round of angles, which is a departure from true differentiality. The vertical axis is perforated for centring over the station mark with the aid of a "lock-down telescope" instead of a plummet. The azimuthal circle is invariably read by an odd number of microscopes, either three or five, at equal intervals apart. The telescope rests with its pivots in Y's at the head of two pillars of a sufficient height to enable it to be completely turned round in altitude. The vertical circle is fixed to the transit axis of the telescope, and is read by two microscopes 180° apart, at the extremities of arms projecting from one of the pillars. The stand is a well-braced tripod, carrying an iron ring on which the theodolite rests and may be turned round bodily whenever desired, as for shifting the position of the zero of the azimuthal circle relatively to the points under observation. The ring is 3 inches broad and of the same diameter as the circle of the foot-screws of the theodolite. In some instruments the foot-screws rest directly on the ring, but the instrument can be raised off the ring and turned round with the aid of an apparatus in the centre of the stand. In others they rest in grooves at the angles of an iron triangle which sits on the ring and can be shifted in position by hand; thus with the stand well levelled in the first instance the circle may be set within 1′ of any required reading. The centring over the station mark is performed by pushing screws placed either in the drum of the stand or at the angles of the triangle.

For travelling the theodolites were packed in two cases, the larger containing the body of the instrument, the smaller the telescope and the vertical circle; the stand constituted a third package. Each was carried on men's shoulders as the safest method of transport; the weights, of the heaviest 36-inch and of the lightest 24-inch instruments, as packed with ropes and bamboos, were, respectively, as follows:—body, 649 lb, telescope, 130, stand, 232; total, 1011 lb; and 300, 135, and 185, total 620 lb.

Signals. 8. *Signals*.—Cairns of stones, poles, or other opaque signals were primarily employed, the angles being measured by day only; eventually it was found that the atmosphere was often more favourable for observing by night than by day, and that distant points were raised well into view by refraction by night which might be invisible or only seen with difficulty by day. Lamps were then introduced of the simple form of a cup, 6 inches in diameter, filled with cotton seeds steeped in oil and resin, to burn under an inverted earthen jar, 30 inches in diameter, with an aperture in the side towards the observer. Subsequently this contrivance gave place to the Argand lamp with parabolic reflector; the opaque day signals were discarded for heliotropes reflecting the sun's rays to the observer. The introduction of luminous signals not only rendered the night as well as the day available for the observations but changed the character of the operations, enabling work to be done during the dry and healthy season of the year, when the atmosphere is generally hazy and dust-laden, instead of being restricted as formerly to the rainy and unhealthy seasons, when distant opaque objects are best seen. A higher degree of accuracy was also secured, for the luminous signals were invariably displayed through diaphragms of appropriate aperture, truly centred over the station mark; and, looking like stars, they could be observed with greater precision, whereas opaque signals are always dim in comparison and are liable to be seen excentrically when the light falls on one side.

A signalling party of three men was usually found sufficient to manipulate a pair of heliotropes—one for single, two for double reflexion, according to the sun's position—and a lamp, throughout the night and day. Heliotropers were also employed at the observing stations to flash instructions to the signallers.

9. *Measuring Horizontal Angles*.—The theodolites were invariably set up under tents for protection against sun, wind, and rain, and centred, levelled, and adjusted for the runs of the microscopes. Then the signals were observed in regular rotation round the horizon, alternately from right to left and *vice versa*; after the prescribed minimum number of rounds, either two or three, had been thus measured, the telescope was turned through 180°, both in altitude and azimuth, changing the position of the face of the vertical circle relatively to the observer, and further rounds were measured, additional measures of single angles were taken if the prescribed observations were not sufficiently accordant. (Measuring horizontal angles.) As the microscopes were invariably equidistant and their number was always odd, either three or five, the readings taken on the azimuthal circle during the telescope pointings to any object in the two positions of the vertical circle, "face right" and "face left," were made on twice as many equidistant graduations as the number of microscopes. The theodolite was then shifted bodily in azimuth, by being turned on the ring on the head of the stand, which brought new graduations under the microscopes at the telescope pointings; then further rounds were measured in the new positions, face right and face left. This process was repeated as often as had been previously prescribed, the successive angular shifts of position being made by equal arcs bringing equidistant graduations under the microscopes during the successive telescope pointings to one and the same object. By these arrangements all periodic errors of graduation were eliminated, the numerous graduations that were read tended to cancel accidental errors of division, and the numerous rounds of measures to minimize the errors of observation arising from atmospheric and personal causes.

The following table (I.) gives details of the procedure at different times; in the headings M stands for the number of microscopes

over the azimuthal circle of the theodolite, Z for the number of the zero settings of the circle, N for the number of graduations brought under the microscopes, A = 360°—N, the arc between the graduations, R the prescribed number of rounds of measures, and P = R × Z, the minimum number of telescope pointings to any station, excluding repetitions for discrepant observations:—

Period	M	Z	N	A	R	P
1830-45	5	8	40	9° 0′	3	24
1845-55	5	10	50	7° 12′	2	20
1855-80	5	10	50	7° 12′	3	30
	3	12	36	10° 0′	3	36

Under this system of procedure the instrumental and ordinary errors are practically cancelled and any remaining error is most probably due to lateral refraction, more especially when the rays of light graze the surface of the ground. The three angles of every triangle were always measured.

Vertical angles. 10. *Vertical Angles. Refraction.*—The apparent altitude of a distant point is liable to considerable variations during the twenty-four hours, under the influence of changes in the density of the lower strata of the atmosphere. Terrestrial refraction is very capricious, more particularly when the rays of light graze the surface of the ground, passing through a medium which is liable to extremes of rarefaction and condensation, under the alternate influence of the sun's heat radiated from the surface of the ground and of chilled atmospheric vapour. When the back and forward verticals at a pair of stations are equally refracted, their difference gives an exact measure of the difference of height. But the atmospheric conditions are not always identical at the same moment everywhere on long rays which graze the surface of the ground, and the ray between two reciprocating stations is liable to be differently refracted at its extremities, each end being influenced in a greater degree by the conditions prevailing around it than by those at a distance; thus instances are on record of a station A being invisible from another B, while B was visible from A.

Refraction. When the great arc entered the plains of the Gangetic valley, simultaneous reciprocal verticals were at first adopted with the hope of eliminating refraction; but it was soon found that they did not do so sufficiently to justify the expense of the additional instruments and observers. Afterwards the back and forward verticals were observed as the stations were visited in succession, the back angles at as nearly as possible the same time of the day as the forward angles, and always during the so-called "time of minimum refraction," which ordinarily commences about an hour after apparent noon and lasts from two to three hours. The apparent zenith distance is always greatest then, but the refraction is a minimum only at stations which are well elevated above the surface of the ground; at stations on plains the refraction is liable to pass through zero and attain a considerable negative magnitude during the heat of the day, for the lower strata of the atmosphere are then less dense than the strata immediately above and the rays are refracted downwards. On plains the greatest positive refractions are also obtained,—maximum values, both positive and negative, usually occurring, the former by night, the latter by day, when the sky is most free from clouds. The values actually met with were found to range from +1.21 down to −0.09 parts of the contained arc on plains; the normal "coefficient of refraction" for free rays between hill stations below 6000 feet was about .07, which diminished to .04 above 18,000 feet, broadly varying inversely as the temperature and directly as the pressure, but much influenced also by local climatic conditions.

In measuring the vertical angles with the great theodolites, graduation errors were regarded as insignificant compared with errors arising from uncertain refraction; thus no arrangement was made for effecting changes of zero in the circle settings. The observations were always taken in pairs, face right and left, to eliminate index errors, only a few daily, but some on as many days as possible, for the variations from day to day were found to be greater than the diurnal variations during the hours of minimum refraction.

11. *Results deduced from Observations of Horizontal Angles; Weights.*—In the Ordnance and other surveys the bearings of the surrounding stations are deduced from the actual observations, but from the "included angles" in the Indian Survey. The observations of every angle are tabulated vertically in as many columns as the number of circle settings face left and face right, and the mean for each setting is taken. For several years the general mean Weights. of these was adopted as the final result; but subsequently a "concluded angle" was obtained by combining the single means with weights inversely proportional to $g^2 + o^2 \div n$,—g being a value of the e.m.s.[1] of graduation derived empirically from the differences between the general mean and the mean for each setting, o the e.m.s. of observation deduced from the differences between the individual measures and their respective means, and n the number of measures at each setting. Thus, putting w_1, w_2, ... for the weights of the single means, w for the weight of the concluded angle, M for the general mean, C for the concluded angle, and d_1, d_2, ... for the differences between M and the single means, we have

$$C = M + \frac{w_1 d_1 + w_2 d_2 + \ldots}{w_1 + w_2 + \ldots} \qquad (1)$$

and
$$w = w_1 + w_2 + \ldots \qquad (2)$$

$C - M$ vanishes when n is constant; it is inappreciable when g is much larger than o; it is significant only when the graduation errors are more minute than the errors of observation; but it was always small, not exceeding 0″.14 with the system of two rounds of measures and 0″.05 with the system of three rounds.

The weights of the concluded angles thus obtained were employed in the primary reductions of the angles of single triangles and polygons which were made to satisfy the geometrical conditions of each figure, because they were strictly relative for all angles measured with the same instrument and under similar circumstances and conditions, as was almost always the case for each single figure. But in the final reductions, when numerous chains of triangles composed of figures executed with different instruments and under different circumstances came to be adjusted simultaneously, it was necessary to modify the original weights, on such evidence of the precision of the angles as might be obtained from other and more reliable sources than the actual measures of the angles. This treatment will now be described.

12. *Determination of Theoretical Absolute Errors of Observed Angles.*—Values of theoretical error for groups Theoretical errors of angles. of angles measured with the same instrument and under similar conditions may be obtained in three ways,—(i.) from the squares of the reciprocals of the weight w deduced as above from the measures of such angle, (ii.) from the magnitudes of the excess of the sum of the angles of each triangle above 180° + the spherical excess, and (iii.) from the magnitudes of the corrections which it is necessary to apply to the angles of polygonal figures and networks to satisfy the several geometrical conditions (indicated in the next section). Let e_1, e_2, and e_3 be the values of the e.m.s. thus obtained; then, putting n for the number of angles grouped together, we have

$$e_1^2 = \frac{n}{[w]} \text{ and } e_2^2 = \frac{[\text{squares of triangular errors}]}{n};$$

also, putting W for the mean of the weights of the t angles

[1] The theoretical "error of mean square" = 1.48 × "probable error."

of a polygonal figure having m geometrical equations of condition, and x for the most probable value of the error of any observed angle, we have

$$e_3^2 = \frac{[vx^2]}{W}\frac{1}{m} = \frac{a}{m} \text{ for a single figure,}$$

$$= \frac{[a]}{[m]} \text{ for a group of figures,}$$

the brackets [] in each case denoting the sum of all the quantities involved e_3 usually gives the best value of the theoretical error, then e_2 As a rule the value by e_1 is too small, but to this there are notable exceptions, in which it was found to be much too great The instrument with which the angles were measured in these instances gave very discrepant results at different settings of the circle, but this was caused by large periodic errors of graduation which did not affect the "concluded angles," because they were eliminated by the systematic changes of setting, so the results were really more precise than was apparent

When weights were determined for the final simultaneous reduction of triangulations executed by different instruments, it became necessary to find a factor ρ to be applied as a modulus to each group of angles measured with the same instrument and under similar conditions, to convert the as yet relative weights into absolute measures of precision ρ was made $= e_1 - e_3$ whenever data were available, if not to $e_1 - e_2$, then the absolute weight of an observed angle in any group was taken as $w\rho^2$ and the e m s of the angle as $1 - \rho\sqrt{w}$ The average values of the e m s thus determined for large groups of angles, measured with the 36-inch and the 24-inch theodolites, ranged from $\pm 0''$ 24 to $\pm 0''$ 67, the smaller values being usually obtained at hill stations, where the atmospheric conditions were most favourable

Harmonizing angles 13 *Harmonizing Angles of Trigonometrical Figures* — Every figure, whether a single triangle or a polygonal network, was made consistent by the application of corrections to the observed angles to satisfy its geometrical conditions The three angles of every triangle having been observed, their sum had to be made $= 180° +$ the spherical excess, in networks it was also necessary that the sum of the angles measured round the horizon at any station should be exactly $= 360°$, that the sum of the parts of an angle measured at different times should equal the whole, and that the ratio of any two sides should be identical, whatever the route through which it was computed These are called the *triangular*, *central*, *toto-partial*, and *side* conditions, they present n geometrical equations, which contain t unknown quantities, the errors of the observed angles, t being always $> n$ When these equations are satisfied and the deduced values of errors are applied as corrections to the observed angles, the figure becomes consistent Primarily the equations were treated by a method of successive approximations, but afterwards they were all solved simultaneously by the so-called method of minimum squares, which leads to the most probable of any system of corrections, it is demonstrated under EARTH, FIGURE OF THE (vol vii p 599) The following is a general outline of the process —

Let x be the most probable value of the error and u the reciprocal of the weight of any observed angle X, and let $a, b, \ldots n$ be the coefficients of x in successive geometrical equations of condition whose absolute terms are $e_a, e_b, \ldots e_n$, then we have the following group of n equations containing t unknown quantities to be satisfied, the significant coefficients of x being 1 in the triangular, toto partial, and central, and $\pm$ cot X in the side equations —

$$\left.\begin{array}{l} a_1x_1 + a_2x_2 + \quad + a_tx_t = e_a \\ b_1x_1 + b_2x_2 + \quad + b_tx_t = e_b \\ \quad\quad\quad \cdot \quad\quad \cdot \\ n_1x_1 + n_2x_2 + \quad + n_tx_t = e_n \end{array}\right\} \quad (3)$$

The values of x will be the most probable when $\left[\frac{x^2}{u}\right]$ is a minimum, a condition which introduces n indeterminate factors $\lambda_a, \ldots \lambda_n$, whose values are obtained by the solution of the following equations —

$$\left.\begin{array}{l} [aa\,u]\lambda_a + [ab\,u]\lambda_b + \quad + [an\,u]\lambda_n = e_a \\ [ab\,u]\lambda_a + [bb\,u]\lambda_b + \quad + [bn\,u]\lambda_n = e_b \\ \\ [an\,u]\lambda_a + [bn\,u]\lambda_b + \quad + [nn\,u]\lambda_n = e_n \end{array}\right\} \quad (4),$$

the brackets indicating summations of t terms as to left of (3)

Then the value of any, the pth, x is

$$x_p = u_p\{a_p\lambda_a + b_p\lambda_b + \quad + n_p\lambda_n\} \quad (5)$$

The minimum of $\left[\frac{x^2}{u}\right]$ is $= [e\lambda]$ (6)

In the application to a single triangle we have $x_1 + x_2 + x_3 = e$, $\lambda = e \div (u_1 + u_2 + u_3)$, $x_1 = u_1\lambda$, $x_2 = u_2\lambda$, $x_3 = u_3\lambda$

In the application to a simple polygon, by changing symbols and putting X and Y for the exterior and Z for the central angles, with errors x, y, and z and weight reciprocals u, v, and w, a for cot X and b for cot Y, e for any triangular error, e_c and e_s for the central and side errors, λ_c and λ_s for the factors for the central and side equations, and W for $u + v + w$, the equations for obtaining the factors become

$$\left.\begin{array}{l} \left[w - \frac{w^2}{W}\right]\lambda_c \quad\quad - \left[\frac{w(au - bv)}{W}\right]\lambda_s = e_c - \left[\frac{uc}{W}\right] \\ -\left[\frac{w(au - bv)}{W}\right]\lambda_c + \left[a^2u + b^2v - \frac{au - bv}{W}\right]\lambda_s = e_s - \left[\frac{(au - bv)e}{W}\right] \end{array}\right\} (7),$$

and the general expressions for the errors of the angles are—

$$\left.\begin{array}{l} x = \frac{u}{W}\{e + (aW - au + bv)\lambda_s - w\lambda_c\} \\ y = \frac{v}{W}\{e - (bW + au - bv)\lambda_s - \lambda w_c\} \\ z = \frac{w}{W}\{e - (au - bv)\lambda_s + (u + v)\lambda_c\} \end{array}\right\} \quad (8)$$

14 *Calculation of Sides of Triangles* —The angles having been made geometrically consistent *inter se* in each figure, the side lengths are computed from the base-line onwards by Legendre's theorem, each angle being diminished by one-third of the spherical excess of the triangle to which it appertains The theorem is applicable without sensible error to triangles of a much larger size than any that are ever measured Sides of triangles

15 *Calculation of Latitudes and Longitudes of Stations and Azimuths of Sides* —A station of origin being chosen of which the latitude and longitude are known astronomically, and also the azimuth of one of the surrounding stations, the differences of latitude and longitude and the reverse azimuths are calculated in succession, for all the stations of the triangulation, by Puissant's formulæ (*Traité de Géodesie*, Paris, 1842, 3d ed) Latitude and longitude of stations, azimuth of sides

Problem —Assuming the earth to be spheroidal, let A and B be two stations on its surface, and let the latitude and longitude of A be known, also the azimuth of B at A, and the distance between A and B at the mean sea level, we have to find the latitude and longitude of B and the azimuth of A at B

The following symbols are employed —a the major and b the minor semi axis, e the excentricity, $= \left\{\frac{a^2 - b^2}{a^2}\right\}^{\frac{1}{2}}$, ρ the radius of curvature to the meridian in latitude λ, $= \frac{a(1 - e^2)}{\{1 - e^2\sin^2\lambda\}^{\frac{3}{2}}}$, ν the normal to the meridian in latitude λ, $= \frac{a}{\{1 - e^2\sin^2\lambda\}^{\frac{1}{2}}}$, λ and L the given latitude and longitude of A, $\lambda + \Delta\lambda$ and $L + \Delta L$ the required latitude and longitude of B, A the azimuth of B at A, B the azimuth of A at B, $\Delta A = B - (\pi + A)$, c the distance between A and B Then, all azimuths being measured from the south, we have

$$\Delta\lambda'' = \left\{\begin{array}{l} -\frac{c}{\rho}\cos A \operatorname{cosec} 1'' \\ -\frac{1}{2}\frac{c^2}{\rho\nu}\sin^2 A \tan\lambda \operatorname{cosec} 1'' \\ -\frac{3}{4}\frac{c^2}{\rho\nu}\frac{e^2}{1 - e^2}\cos^2 A \sin 2\lambda \operatorname{cosec} 1'' \\ +\frac{1}{6}\frac{c^3}{\rho\nu^2}\sin^2 A \cos A(1 + 3\tan^2\lambda) \operatorname{cosec} 1'' \end{array}\right\} \quad (9),$$

$$\Delta L'' = \left\{\begin{array}{l} -\frac{c}{\nu}\frac{\sin A}{\cos\lambda}\operatorname{cosec} 1'' \\ +\frac{1}{2}\frac{c^2}{\nu^2}\frac{\sin 2A \tan\lambda}{\cos\lambda}\operatorname{cosec} 1'' \\ -\frac{1}{6}\frac{c^3}{\nu^3}\frac{(1 + 3\tan^2\lambda)\sin 2A \cos A}{\cos\lambda}\operatorname{cosec} 1'' \\ +\frac{1}{3}\frac{c^3}{\nu^3}\frac{\sin^3 A \tan^2\lambda}{\cos\lambda}\operatorname{cosec} 1'' \end{array}\right\} (10),$$

$$
\begin{array}{c}\Delta A'' \text{ or} \\ B-(\pi+A)\end{array} = \left\{
\begin{array}{l}
-\frac{c}{\nu} \sin A \tan\lambda \operatorname{cosec} 1'' \\
+\frac{1}{4}\frac{c^2}{\nu^2}\left\{1+2\tan^2\lambda+\frac{e^2\cos^2\lambda}{1-e^2}\right\}\sin 2A \operatorname{cosec} 1'' \\
-\frac{c^3}{\nu^3}\left(\frac{5}{6}+\tan^2\lambda\right)\frac{\tan\lambda}{2}\sin 2A\cos A \operatorname{cosec} 1'' \\
+\frac{1}{6}\frac{c^3}{\nu^3}\sin^3 A\tan\lambda\,(1+2\tan^2\lambda)\operatorname{cosec} 1''
\end{array}\right\} \quad (11)
$$

Each Δ is the sum of four terms symbolized by δ_1, δ_2, δ_3, and δ_4, the calculations are so arranged as to produce these terms in the order $\delta\lambda$, δL, and δA, each term entering as a factor in calculating the following term The arrangement is shown below in equations in which the symbols P, Q, Z represent the factors which depend on the adopted geodetic constants, and vary with the latitude, the logarithms of their numerical values are tabulated in the *Auxiliary Tables to Facilitate the Calculations of the Indian Survey*

$$
\left.\begin{array}{lll}
\delta_1\lambda = -P\cos A\, c & \delta_1 L = +\delta_1\lambda\, Q\sec\lambda\tan A & \delta_1 A = +\delta_1 L\sin\lambda \\
\delta_2\lambda = +\delta_1 A\, R\sin A\, c & \delta_2 L = -\delta_2\lambda\, S\cot A & \delta_2 A = +\delta_2 L\, T \\
\delta_3\lambda = -\delta_2 A\, V\cot A & \delta_3 L = +\delta_3\lambda\, U\sin A\, c & \delta_3 A = +\delta_3 L\, W \\
\delta_4\lambda = -\delta_3 A\, X\tan A & \delta_4 L = +\delta_4\lambda\, Y\tan A & \delta_4 A = +\delta_4 L\, Z
\end{array}\right\} \quad (12)
$$

By this artifice the calculations are rendered less laborious and made susceptible of being readily performed by any persons who are acquainted with the use of logarithm tables

Limits of geodetic formulæ

16 *Limits within which Geodetic Formulæ may be employed without Sensible Error* —Each Δ is expressed as a series of ascending differentials in which all terms above the third order are neglected, for the side length c in no case exceeded 70 miles, nor was the latitude ever higher than 36°, and for these extreme values the maximum magnitudes of the fourth differential are only 0″ 002 in latitude and 0″ 004 in longitude and azimuth

Far greater error may arise from uncertainties regarding the elements of the earth's figure, which was assumed to be spheroidal, with semi-axes $a = 20{,}922{,}932$ feet and $b = 20{,}853{,}375$ feet The changes in $\Delta\lambda$, ΔL, and ΔA which would arise from errors da and db in a and b are indicated by the following formulæ —

$$
\left.\begin{array}{l}
d\,\Delta\lambda = -\Delta\lambda\,\frac{d\rho}{\rho} - \delta_2\lambda\,\frac{d\nu}{\nu} - \delta_3\lambda\left(\frac{d\nu}{\nu} - \frac{2de}{(1-e^2)e}\right) - 2\delta_4\lambda\,\frac{d\nu}{\nu} \\
d\,\Delta L = -\Delta L\,\frac{d\nu}{\nu} - \delta_2 L\,\frac{d\nu}{\nu} - (\delta_3 L + \delta_4 L)2\frac{d\nu}{\nu} \\
d\,\Delta A = -\Delta A\,\frac{d\nu}{\nu} - \delta_2 A\left\{\frac{d\nu}{\nu} - \frac{\nu}{\rho}\left(\frac{d\nu}{\nu} - \frac{d\rho}{\rho}\right)\frac{1}{2\tan^2\lambda + \frac{\nu}{\rho}}\right\} \\
\qquad - (\delta_3 A + \delta_4 A)2\frac{d\nu}{\nu}
\end{array}\right\} \quad (13),
$$

in which

$$
\left.\begin{array}{l}
\frac{d\rho}{\rho} = -\ 000{,}000{,}0478\,\{da - 2db - 3(da-db)\sin^2\lambda\} \\
\frac{d\nu}{\nu} = +\ 000{,}000{,}0478\,\{da + (da-db)\sin^2\lambda\} \\
\frac{2de}{(1-e^2)e} = +\ 000{,}0145\,\{da - db\}
\end{array}\right\} \quad (14)
$$

The adopted values of the semi-axes were determined by Colonel Everest in an investigation of the figure of the earth from such data as were available in 1826 Forty years afterwards an investigation was made by Captain (now Colonel) A R Clarke with additional data, which gave new values, both exceeding the former [1] Accepting these as exact, the errors of the first values are $da = -3130$ feet and $db = -1746$ feet, the former being 150, the latter 84 millionth parts of the semi-axis The corresponding changes in arcs of 1° of latitude and longitude, expressed in seconds of arc and in millionth parts (μ) of arc-length, are as follows —

In lat	5°	$d\,\Delta\lambda = -''\,069$	or 19 μ	and $d\,\Delta L = -''\,540$	or 150 μ,
,,	15°	,, $-''\,113$	,, 31 ,,	,, ,, $-''\,554$	,, 154 ,, ,
,,	25°	,, $-''\,195$	,, 54 ,,	,, ,, $-''\,581$	,, 161 ,, ,
,,	35°	,, $-''\,303$	,, 84 ,,	,, ,, $-''\,617$	,, 171 ,,

These assumed errors in the geodetic latitudes and longitudes are of service when comparisons are made between independent astronomical and geodetic determinations at any points for which both may be available they indicate the extent to which differences may be attributable to errors in the adopted geodetic constants, as distinct from errors in the trigonometrical or the astronomical operations

Reduction of principal triangulation

17 *Final Reduction of Principal Triangulation*.—The calculations described so far suffice to make the angles of the several trigonometrical figures consistent *inter se*, and to give preliminary values of the lengths and azimuths of the sides and the latitudes and longitudes of the stations The results are amply sufficient for the requirements of the topographer and land surveyor, and they are published in preliminary charts, which give full numerical details of latitude, longitude, azimuth, and side length, and of height also, for each portion of the triangulation—secondary as well as principal—as executed year by year But on the completion of the several chains of triangles further reductions became necessary, to make the triangulation everywhere consistent *inter se* and with the verificatory base-lines, so that the lengths and azimuths of common sides and the latitudes and longitudes of common stations should be identical at the junctions of chains, and that the measured and computed lengths of the base-lines should also be identical

How this was done will now be set forth But first it must be noted that the triangulation might at the same time have been made consistent with any values of latitude, longitude, or azimuth which had been determined by astronomical observations at either of the trigonometrical stations This, however, was undesirable, because such observations are liable to errors from deflexion of the plumb-line from the true normal under the influence of local attraction, and these errors are of a much greater magnitude than those that would be generated in triangulating between astronomical stations which are not a great distance apart The trigonometrical elements could not be forced into accordance with the astronomical without altering the angles by amounts much larger than their probable errors, and the results would be useless for investigations of the figure of the earth The only independent facts of observation which could be legitimately combined with the angular adjustments were the base-lines, and all these were employed, while the several astronomical determinations—of latitude, differential longitude, and azimuth—were held in reserve for future geodetic investigations

Specific illustration

As an illustration of the problem for treatment, suppose a combination of three meridional and two longitudinal chains comprising seventy two single triangles, with a base line at each corner, as shown in the accompanying diagram (fig 2), suppose the three angles of every triangle to have been measured and made consistent Let A be the origin, with its latitude and longitude given, and also the length and azimuth of the adjoining base line With these data processes of calculation are carried through the triangulation to obtain the lengths and azimuths of the sides and the latitudes and longitudes of the stations, say in the following order —from A through B to E, through F to E, through F to D, through F and E to C, and through F and D to C Then there are two values of side, azimuth, latitude, and longitude at E,—one from the right-hand chains *via* B, the other from the left hand chains *via* F, similarly there are two sets of values at C, and each of the base-lines at B, C, and D has a calculated as well as a measured value Thus eleven absolute errors are presented for dispersion over the triangulation by the application of the most appropriate correction to each angle, and, as a preliminary to the determination of these corrections, equations must be constructed between each of the absolute errors and the unknown errors of the angles from which

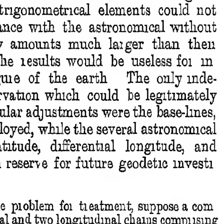

Fig 2

[1] See *Account of the Principal Triangulation of the Ordnance Survey*, 1858, and *Comparisons of Standards of Length*, 1866

they originated. For this purpose assume X to be the angle opposite the flank side of any triangle, and Y and Z the angles opposite the sides of continuation, also let x, y, and z be the most probable values of the errors of the angles which will satisfy the given equations of condition. Then each equation may be expressed in the form $[ax+by+cz]=E$, the brackets indicating a summation for all the triangles involved. We have first to ascertain the values of the coefficients a, b, and c of the unknown quantities. They are readily found for the side equations on the circuits and between the base-lines, for x does not enter them, but only y and z, with coefficients which are the cotangents of Y and Z, so that these equations are simply $[\cot Y\, y - \cot Z\, z]=E$. But three out of four of the circuit equations are geodetic, corresponding to the closing errors in latitude, longitude, and azimuth, and in them the coefficients are very complicated. They are obtained as follows. The first term of each of the three expressions for $\Delta\lambda$, ΔL, and B is differentiated in terms of c and A, giving

$$\left.\begin{aligned} d\,\Delta\lambda &= \Delta\lambda\left\{\frac{dc}{c} - dA\tan A\sin 1''\right\} \\ d\,\Delta L &= \Delta L\left\{\frac{dc}{c} + dA\cot A\sin 1''\right\} \\ dB &= dA + \Delta A\left\{\frac{dc}{c} + dA\cot A\sin 1''\right\} \end{aligned}\right\} \qquad (15),$$

in which dc and dA represent the errors in the length and azimuth of any side c which have been generated in the course of the triangulation up to it from the base-line and the azimuth station at the origin. The errors in the latitude and longitude of any station which are due to the triangulation are $d\lambda_{,}=[d\,\Delta\lambda]$, and $dL_{,}=[d\,\Delta L]$. Let station 1 be the origin, and let 2, 3, be the succeeding stations taken along a predetermined line of traverse, which may either run from vertex to vertex of the successive triangles, zigzagging between the flanks of the chain, as in fig 3 (1), or be carried directly along one of the flanks, as in fig 3 (2). For the general symbols of the differential equations substitute $\Delta\lambda_n$, ΔL_n, ΔA_n, c_n, A_n, and B_n, for the side between stations n and $n+1$ of the traverse, and let δc_n and δA_n be the errors generated between the sides c_{n-1} and c_n, then

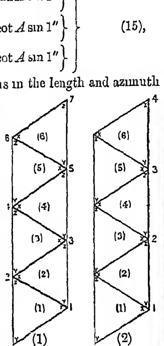

Fig 3

$$\frac{dc_1}{c_1}=\frac{\delta c_1}{c_1}, \quad \frac{dc_2}{c_2}=\frac{\delta c_1}{c_1}+\frac{\delta c_2}{c_2}, \qquad \frac{dc_n}{c_n}={}_1^n\!\left[\frac{\delta c}{c}\right],$$

$$dA_1=\delta A_1, \quad dA_2=dB_1+\delta A_2, \qquad dA_n=dB_{n-1}+\delta A_n$$

Performing the necessary substitutions and summations, we get

$$dB_n=\begin{cases} {}_1^n[\Delta A]\dfrac{\delta c_1}{c_1}+{}_2^n[\Delta A]\dfrac{\delta c_2}{c_2}+ \quad +\Delta A_n\dfrac{\delta c_n}{c_n} \\ +(1+{}_1^n[\Delta A\cot A]\sin 1'')\delta A_1+(1+{}_2^n[\Delta A\cot A]\sin 1'')\delta A_2 \\ \quad + \quad +(1+\Delta A_n\cot A_n\sin 1'')\delta A_n \end{cases}$$

$$d\lambda_{n+1}=\begin{cases} {}_1^n[\Delta\lambda]\dfrac{\delta c_1}{c_1}+{}_2^n[\Delta\lambda]\dfrac{\delta c_2}{c_2}+ \quad +\Delta\lambda_n\dfrac{\delta c_n}{c_n} \\ -\{{}_1^n[\Delta\lambda\tan A]\delta A_1+{}_2^n[\Delta\lambda\tan A]\delta A_2+ \\ \quad +\Delta\lambda_n\tan A_n\delta A_n\}\sin 1'' \end{cases}$$

$$dL_{n+1}=\begin{cases} {}_1^n[\Delta L]\dfrac{\delta c_1}{c_1}+{}_2^n[\Delta L]\dfrac{\delta c_2}{c_2}+ \quad +\Delta L_n\dfrac{\delta c_n}{c_n} \\ +\{{}_1[\Delta L\cot A]\delta A_1+{}_2^n[\Delta L\cot A]\delta A_2+ \\ \quad +\Delta L_n\cot A_n\delta A_n\}\sin 1'' \end{cases}$$

Thus we have the following expression for any geodetic error—

$$\mu_1\frac{\delta c_1}{c_1}+ \quad +\mu_n\frac{\delta c_n}{c_n}+\phi_1\delta A_1+ \quad +\phi_n\delta A_n=E, \qquad (16),$$

where μ and ϕ represent the respective summations which are the coefficients of δc and δA in each instance but the first, in which 1 is added to the summation in forming the coefficient of δA.

The angular errors x, y, and z must now be introduced, in place of δc and δA, into the general expression, which will then take different forms, according as the route adopted for the line of traverse was the zigzag or the direct. In the former, the number of stations on the traverse is ordinarily the same as the number of triangles, and, whether or no, a common numerical notation may be adopted for both the traverse stations and the collateral triangles, thus the angular errors of every triangle enter the general expression in the form $\qquad \pm\phi x+\cot Y\mu'y-\cot Z\mu'z$,
in which $\mu'=\mu\sin 1''$, and the upper sign of ϕ is taken if the triangle lies to the left, the lower if to the right, of the line of traverse. When the direct traverse is adopted, there are only half as many traverse stations as triangles, and therefore only half the number of μ's and ϕ's to determine, but it becomes necessary to adopt different numberings for the stations and the triangles, and the form of the coefficients of the angular errors alternates in successive triangles. Thus, if the pth triangle has no side on the line of the traverse but only an angle at the lth station, the form is

$$+\phi_l x_p+\cot Y_p\mu'_l y_p-\cot Z_p\mu'_l z_p$$

If the qth triangle has a side between the lth and the $(l+1)$th stations of the traverse, the form is

$$\cot X_q(\mu'_l-\mu'_{l+1})x_q+(\phi_l+\mu'_{l+1}\cot Y_q)y_q-(\phi_{l+1}-\mu'_l\cot Z_q)z_q$$

As each circuit has a right-hand and a left-hand branch, the errors of the angles are finally arranged so as to present equations of the general form

$$[ax+by+cz]_r-[ax+by+cz]_l=E$$

The eleven circuit and base line equations of condition having been duly constructed, the next step is to find values of the angular errors which will satisfy these equations, and be the most probable of any system of values that will do so, and at the same time will not disturb the existing harmony of the angles in each of the seventy-two triangles. Harmony is maintained by introducing the equation of condition $x+y+z=0$ for every triangle. The most probable results are obtained by the method of minimum squares, which may be applied in two ways.

(i.) A factor λ may be obtained for each of the eighty-three equations under the condition that $\left[\dfrac{x^2}{u}+\dfrac{y^2}{v}+\dfrac{z^2}{w}\right]$ is made a minimum, u, v, and w being the *reciprocals* of the weights of the observed angles. This necessitates the simultaneous solution of eighty three equations to obtain as many values of λ. The resulting values of the errors of the angles in any, the pth, triangle, are

$$x_p=u_p[a_p\lambda], \; y_p=v_p[b_p\lambda], \; z_p=w_p[c_p\lambda] \qquad (17)$$

(ii.) One of the unknown quantities in every triangle, as x, may be eliminated from each of the eleven circuit and base line equations by substituting its equivalent $-(y+z)$ for it, a similar substitution being made in the minimum. Then the equations take the form $[(b-a)y+(c-a)z]=E$, while the minimum becomes

$$\left[\frac{(y+z)^2}{u}+\frac{y^2}{v}+\frac{z^2}{w}\right]$$

Thus we have now to find only eleven values of λ by a simultaneous solution of as many equations, instead of eighty-three values from eighty three equations, but we arrive at more complex expressions for the angular errors as follows —

$$\left.\begin{aligned} y_p&=\frac{v_p}{u_p+v_p+w_p}\{(u_p+w_p)[(b_p-a_p)\lambda]-w_p[(c_p-a_p)\lambda]\} \\ z_p&=\frac{w_p}{u_p+v_p+w_p}\{(u_p+v_p)[(c_p-a_p)\lambda]-v_p[(b_p-a_p)\lambda]\} \end{aligned}\right\} \qquad (18)$$

The second method has invariably been adopted, originally because it was supposed that, the number of the factors λ being reduced from the total number of equations to that of the circuit and base line equations, a great saving of labour would be effected. But subsequently it was ascertained that in this respect there is little to choose between the two methods, for, when x is not eliminated, and as many factors are introduced as there are equations, the factors for the triangular equations may be readily eliminated at the outset. Then the really severe calculations will be restricted to the solution of the equations containing the factors for the circuit and base-line equations, as in the second method. Reduction of principal triangulation

In the preceding illustration it is assumed that the base lines are errorless as compared with the triangulation. Strictly speaking, however, as base lines are fallible quantities, presumably of different weight, their errors should be introduced as unknown quantities of which the most probable values are to be determined in a simultaneous investigation of the errors of all the facts of observation, whether linear or angular. When they are connected together by so few triangles that their ratios may be deduced as accurately, or nearly so, from the triangulation as from the measured lengths, this ought to be done, but, when the connecting triangles are so numerous that the direct ratios are of much greater weight than the trigonometrical, the errors of the base lines may be neglected. In the reduction of the Indian triangulation it was decided, after examining the relative magnitudes of the probable errors of the linear and the angular measures and ratios, to assume the base lines to be errorless (see § 19, p 704 below).

The chains of triangles being largely composed of polygons or other networks, and not merely of single triangles, as has been assumed for simplicity in the illustration, the geometrical harmony to be maintained involved the introduction of a large number of "side," "central," and "toto partial" equations of condition, as well as the triangular. Thus the problem for attack was the simultaneous solution of a number of equations of condition = that of all the geometrical conditions of every figure + four times the number of circuits formed by the chains of triangles + the number of base-lines − 1, the number of unknown quantities contained in the equations being that of the whole of the observed angles, the method of procedure, if rigorous, would be precisely similar to that

already indicated for "harmonizing the angles of trigonometrical figures," of which it is merely an expansion from single figures to great groups.

The rigorous treatment would, however, have involved the simultaneous solution of about 4000 equations between 9230 unknown quantities, which was quite impracticable. The triangulation was therefore divided into sections for separate reduction, of which the most important were the five between the meridians of 67° and 92° (see fig. 1, p. 696), consisting of four quadrilateral figures and a trigon, each comprising several chains of triangles and some base-lines. This arrangement had the advantage of enabling the final reductions to be taken in hand as soon as convenient after the completion of any section, instead of being postponed until all were completed. It was subject, however, to the condition that the sections containing the best chains of triangles were to be first reduced; for, as all chains bordering contiguous sections would necessarily be "fixed" as a part of the section first reduced, it was obviously desirable to run no risk of impairing the best chains by forcing them into adjustment with others of inferior quality. It happened that both the north-east and the south-west quadrilaterals contained several of the older chains; their reduction was therefore made to follow that of the collateral sections containing the modern chains.

But the reduction of each of these great sections was in itself a very formidable undertaking, necessitating some departure from a purely rigorous treatment. For the chains were largely composed of polygonal networks and not of single triangles only as assumed in the illustration, and therefore cognizance had to be taken of a number of "side" and other geometrical equations of condition, which entered irregularly and caused great entanglement. Equations 17 and 18 of the illustration are of a simple form because they have a single geometrical condition to maintain, the triangular, which is not only expressed by the simple and symmetrical equation $x+y+z=0$, but—what is of much greater importance—recurs in a regular order of sequence that materially facilitates the general solution. Thus, though the calculations must in all cases be very numerous and laborious, rules can be formulated under which they can be well controlled at every stage and eventually brought to a successful issue. The other geometrical conditions of networks are expressed by equations which are not merely of a more complex form but have no regular order of sequence, for the networks present a variety of forms; thus their introduction would cause much entanglement and complication, and greatly increase the labour of the calculations and the chances of failure. Wherever, therefore, any compound figure occurred, only so much of it as was required to form a chain of single triangles was employed. The figure having previously been made consistent, it was immaterial what part was employed, but the selection was usually made so as to introduce the fewest triangles. The triangulation for final simultaneous reduction was thus made to consist of chains of single triangles only; but all the included angles were "fixed" simultaneously. The excluded angles of compound figures were subsequently harmonized with the fixed angles, which was readily done for each figure *per se*.

This departure from rigorous accuracy was not of material importance, for the angles of the compound figures excluded from the simultaneous reduction had already, in the course of the several independent figural adjustments, been made to exert their full influence on the included angles. The figural adjustments had, however, introduced new relations between the angles of different figures, causing their weights to increase *cæteris paribus* with the number of geometrical conditions satisfied in each instance. Thus, suppose w to be the average weight of the t observed angles of any figure, and n the number of geometrical conditions presented for satisfaction; then the average weight of the angles after adjustment may be taken as $w\frac{t}{t-n}$, the factor thus being 1.5 for a triangle, 1.8 for a hexagon, 2 for a quadrilateral, 2.5 for the network around the Sironj base-line, &c.

In framing the normal equations between the indeterminate factors λ for the final simultaneous reduction, it would have greatly added to the labour of the subsequent calculations if a separate weight had been given to each angle, as was done in the primary figural reductions; this was obviously unnecessary, for theoretical requirements would now be amply satisfied by giving equal weights to all the angles of each independent figure. The mean weight that was finally adopted for the angles of each group was therefore taken as

$$w\rho\frac{t}{t-n},$$

ρ being the modulus already indicated in section 12.

The second of the two processes for applying the method of minimum squares having been adopted, the values of the errors y and z of the angles appertaining to any, the pth, triangle were finally expressed by the following equations, which are derived from (18) by substituting u for the reciprocal final mean weight as above determined:—

$$\left.\begin{aligned} y_p &= \frac{u_p}{3}[(2b_p - a_p - c_p)\lambda] \\ z_p &= \frac{u_p}{3}[(2c_p - a_p - b_p)\lambda] \end{aligned}\right\} \qquad (19)$$

The most laborious part of the calculations was the construction and solution of the normal equations between the factors λ. On this subject a few hints are desirable, because the labour involved is liable to be materially influenced by the order of sequence adopted in the construction. The normal equations invariably take the form of (4), the coefficients on the diagonal containing summations of squares of the coefficients in the primary equations, while those above and below contain summations of products of the primary quantities, such that the coefficient of the pth λ in the qth equation is the same as that of the qth λ in the pth equation. In practice, as any single angular error only enters a few of the primary equations of condition, many of the coefficients vanish, both in the primary and in the normal equations; and it is an object of great importance so to arrange the normal equations that most blanks shall occur *above* and fewest blanks *between* the significant values on each vertical line of coefficients; in other words, the significant values above and below the diagonal should lie as closely as possible to the diagonal, every value on which is always significant. This advantage is secured when the primary equations are arranged in groups in which each contains a number of angular errors in common and as many as possible of those entering the group on each side. Thus the arrangement must follow the natural succession of the chains of triangles rather than the characteristics of the primary equations; if, for example, all the side equations were grouped together, and all the latitude equations, and so on, great entanglement would arise in the solution of the normal equations, enormously increasing the labour and the chances of failure. The best arrangement was found to be to group the side and the three geodetic equations of each circuit together in the order of sequence of the meridional chains of triangles, and then to introduce the side equations connecting base-lines between the groups with which they had most in common.

The following table (II.) gives the number of equations of condition and unknown quantities—the angular errors—in the five great sections of the triangulation, which were respectively included in the simultaneous general reductions and relegated to the subsequent adjustments of each figure *per se*:—

Section	Simultaneous			External Figural					
	Equations		Angular Errors	Equations				Angular Errors	No. of Figures
	Circuit and Base-line	Tri-angular		Tri-angular	Central	Side	Toto-partial		
1. N.W. Quad.	23	550	1650	267	104	152	6	761	110
2. S.E. Quad.	15	277	831	164	64	92	2	476	68
3. N.E. Quad.	49	573	1719	112	56	60	0	341	50
4. Trigon	22	303	909	192	79	101	2	547	77
5. S.W. Quad.	24	172	516	83	32	52	1	237	40

The magnitudes of the 2481 angular errors determined simultaneously in the first two sections were very small, 2240 being under 0″.1, 205 between 0″.1 and 0″.2, 33 between 0″.2 and 0″.3, 2 between 0″.3 and 0″.4, and 1 between 0″.4 and 0″.5. In the third section, which contained a number of old chains, executed with instruments inferior to the 2 and 3 foot theodolites, they were larger: 780 were under 0″.1, 911 between 0″.1 and 1″.0, 27 between 1″.0 and 2″.0, and 1 between 2″.0 and 2″.1. Thus the corrections to the angles were generally very minute, rarely exceeding the theoretical probable errors of the angles, and therefore applicable without taking any liberties with the facts of observation.

18. *Theoretical Error of any Function of Angles of a Geometrically corrected Triangulation.*—The investigation of such theoretical errors was no easy matter. When first essayed it was generally assumed by mathematicians in England that any attempt to exhibit the theoretical error by a purely algebraical process soon led to results of intolerable complexity, so that it was desirable to introduce numbers as soon as possible for every symbol except the absolute terms of the geometrical or primary equations of condition. But on continuing the algebraical process certain relations were found to exist between the coefficients of the indeterminate factors in the normal equations of the minimum square method and the coefficients of the unknown quantities in the primary equations of condition, which enormously simplified the process and led to a general algebraical expression of no great complexity; it was also found that, the number of primary equations being n, the

Theoretical errors of functions of angles.

labour of calculation by the formula was reduced to an nth of that involved by resorting at once to numbers

Let F be any function whatever of the corrected angles $(X_1 - x_1)$, $(X_2 - x_2)$, of a trigonometrical figure, let

$$f_1 = \frac{dF}{dX_1},\ f_2 = \frac{dF}{dX_2} \quad ,$$

also let u_1, u_2, , symbols hitherto employed to represent the relative reciprocal weights of the observed angles X_1, X_2, , in future represent absolute measures of precision, the $p\,e^2$ of the observed angles, then the following formula expresses the $p\,e$ of any function of the corrected angles rigorously —

$$\begin{array}{l} p\,e^2 \text{ of } F \\ = f^2 u - \end{array} \left\{ \begin{array}{l} +[fa\ u]\{[fa\ u]A_a + [fb\ u]A_b + \quad + [fn\ u]A_n\} \\ +[fb\ u]\{[fa\ u]B_a + [fb\ u]B_b + \quad + [fn\ u]B_n\} \\ + \\ +[fn\ u]\{[fa\ u]N_a + [fb\ u]N_b + \quad + [fn\ u]N_n\} \end{array} \right\} \quad (20)$$

The symbols $a, b,$ n have the same signification as in (3) to (6) of section 13 $A, B,$ N are coefficients which must be determined in the process of solving the normal equations as follows —

$$\left. \begin{array}{l} \lambda_a = A_a e_a + A_b e_b + \quad + A_n e_n \\ \lambda_b = B_a e_a + B_b e_b + \quad + B_n e_n \\ \\ \lambda_n = N_a e_a + N_b e_b + \quad + N_n e_n \end{array} \right\} \quad (21),$$

where the coefficient represented by any two letters in one order is identical with that represented by the same letters in the reverse order, thus $A_n = N_a$ Hence to find the $p\,e$ of any angle, as $(X_1 - x_1)$, in a single triangle we have

$$f_1 = 1, \text{ and } A_a = \frac{1}{[aa\ u]} = \frac{1}{u_1 + u_2 + u_3},$$

all the other factors vanish, and

$$p\,e^2 \text{ of } (X_1 - x_1) = u_1 - \frac{u_1}{u_1 + u_2 + u_3} = p\,e^2 \text{ of } X_1 - p\,e^2 \text{ of } x_1$$

To find the $p\,e$ of the ratio R of either side to the base,—if

$$R = \sin(X_1 - x_1) - \sin(X_2 - x_2),$$

then $\quad f_1 = R \cot X_1 \sin 1'',\ f_2 = R \cot X_2 \sin 1'',\ f_3 = 0,$

and $p\,e^2$ of R

$$= R^2 \sin^2 1'' \left\{ u_1 \cot^2 X_1 + u_2 \cot^2 X_2 - \frac{(u_1 \cot X_1 - u_2 \cot X_2)^2}{u_1 + u_2 + u_3} \right\} \quad (22)$$

When the function of the corrected angles is the ratio of the terminal to the initial side of an equilateral triangle or a regular quadrilateral or polygon (either of two sides being taken if the figure has an odd number of exterior sides), then, assuming all the angles to be of equal weight, we have the following values of the $p\,e$'s and the relative weights of the ratios —

Figure	p e	Weight	Figure	p e	Weight
Triangle	$\pm 82\sqrt{u} \sin 1''$	1 49	Pentagon	$\pm 1\ 21\sqrt{u} \sin 1''$	0 68
Quadrilateral	1 00 ,,	1 00	Hexagon	1 29 ,,	0 60
Trigon	1 05 ,,	0 90	Heptagon	1 11 ,,	0 50
Tetragon	1 15 ,,	0 75	Octagon	1 57 ,,	0 41

In ordinary ground seven single triangles will span about as much as two hexagons and the weights of the terminal sides would be as twenty-one by the former to thirty by the latter In a flat country two quadrilaterals would not span more than one hexagon, giving terminal side weights as five to six, but in hills a quadrilateral may span as much as any polygon and give a more exact side of continuation Thus in the Indian Survey polygons predominate in the plains and quadrilaterals in the hills

The theoretical errors of the lengths and azimuths of the sides, and of the latitudes and longitudes of the stations, at the termini of the chains of triangles or at the circuit closings, might be calculated with the coefficients a, b, and c of x, y, and z in the circuit and base-line equations as the f's, and the known $p\,e$'s of X, Y, and Z and the other data of the figural reductions Such calculations are, however, much too laborious to be ordinarily undertaken Thus the exactitude of a triangulation is very generally estimated merely on the evidence of the magnitudes of the differences between the trigonometrical and the measured lengths of the base-lines, for, though the combined influence of angular precision and geometrical configuration is what really governs the precision of the results, it is not readily ascertainable, and is therefore generally ignored But, when questions as to the intrinsic value of a triangulation arise, the theory of errors should always be appealed to, and its intimations accepted rather than the evidence of base-line discrepancies, which if very small are certainly accidental, and if seemingly large may be no greater than what we should be prepared to expect Good work has occasionally been redone unnecessarily, and inferior work upheld, because their merits were erroneously estimated The following formulæ will be found useful in acquiring a fairly approximate knowledge of the magnitude of the errors which theory would lead us to expect, not only in side, but in latitude, longitude, and azimuth also, at the close of any chain of triangles They indicate rigorously the $p\,e$'s at the terminal end of a chain of equilateral triangles of which all the angles have been measured and corrected and are of equal weight, the results may be made to serve for less symmetrical chains, including networks of varying weight, by the application of certain factors which can be estimated with fair precision in each instance

Let c be the side length, ϵ the $p\,e$ of the angles, n the number of triangles, and R the ratio (here=1) of the terminal to the initial side, then

$$\left. \begin{array}{r} p\,e \text{ of } R = \epsilon \sin 1'' R \sqrt{\tfrac{2}{3} n} \\ p\,e \text{ of azimuth} = \epsilon \sqrt{\tfrac{2}{3} n} \\ p\,e \text{ of either coordinate} = \epsilon c \dfrac{\sin 1''}{6} \sqrt{2n^3 + 3n^2 + 10n} \end{array} \right\} \quad (23)^1$$

When the form of the triangles deviates much from the equiangular, the $p\,e$ must be multiplied by a factor increasing up to 1 4 as the angles diminish from 60° to 30°, and a mean value of c must be adopted When the chain is double throughout, the $p\,e$ must be diminished by a factor taking cognizance of the greater weight of compound figures than of single triangles When the chain is composed of groups of angles measured with different instruments, a separate value of ϵ must be employed for each group, and the final result obtained from $\sqrt{[p\,e^2]}$ The $p\,e$ of R may be determined rigorously for any chain of single triangles, with angles of varying magnitudes and weights, by (22), with little labour of calculation

Theoretical errors of base-lines and of a triangulation

19 *Relations between Theoretical Errors of Base-lines and those of a Triangulation*—These relations have to be investigated in order to ascertain whether the base-lines may be assumed to be errorless in the general reduction of the triangulation, being fallible quantities, their errors must be included among the unknown quantities to be investigated simultaneously, if their respective $p\,e$'s differ sensibly, or if the $p\,e$'s of their ratios are not materially smaller than those of the corresponding trigonometrical ratios By (23) the $p\,e$ of the ratio of any two sides of an equilateral triangle is $\epsilon \sin 1'' \sqrt{2-3}$, but the $p\,e$ of the ratio of two base-lines of equal length and weight is $\eta\sqrt{2}$, where η is the $p\,e$ of either base-line, thus weight of trigonometrical ratio weight of base-line ratio $3\eta^2$ $\epsilon^2 \sin^2 1''$, or as 3 1 when $\epsilon = \pm 0''\ 3$ and $\eta = \pm 1\ 5$ millionth parts, which happens generally in the Indian triangulation But the chains between base-lines were always composed of a large number of triangles, and the average weight of the base-line ratios was about eleven times greater by the direct linear measurements than by the triangulation, even when all the unascertainable constant or accidental errors —as from displacements of mark-stones—which might be latent in the latter were disregarded Moreover, the base-lines were practically all of the same precision, they were therefore treated as errorless, and the triangulation was made accordant with them

If a base-line AD be divided at B and C into three equal sections connected together by equilateral triangles, and every angle has been measured with a $p\,e = \epsilon$, the $p\,e$. of any trigonometrical ratio may be put $= \kappa\epsilon \sin 1''$, κ being a coefficient which has two values for each ratio,—the greater value when the triangulation has been carried along one flank of the line, the smaller when along both

[1] For an investigation of these formulæ, see Appendix No 3, vol vii of *Account of Operations of Great Trigonom Survey*, 1882

ranks, as follows:—for ratio $\frac{BC}{AB}$, $\kappa = 1{\cdot}41$ and 1, for $\frac{CD}{AB}$, $1{\cdot}33$ and $1{\cdot}23$; for $\frac{AD}{AB}$, $2{\cdot}94$ and $1{\cdot}99$; for $\frac{AD}{BC}$, $2{\cdot}16$ and $1{\cdot}46$. The values for the last two ratios show that, when the length of a base-line is determined partly by measurement and partly by triangulation, the p.e. is smallest if the central section rather than an end section is measured.

If, with linear and angular p.e.'s as in the Indian operations, a single section is measured once only, and the lengths of the other sections are derived from it by triangulation, the p.e. of the entire length will be greater than that of the whole line once measured; it will be less if the section is measured oftener than once and the mean taken.

Azimuth observations

20. *Azimuth Observations in connexion with Principal Triangulation.*—These were invariably determined by measuring the horizontal angle between a referring mark and a circumpolar star, shortly before and after elongation, and usually at both elongations in order to eliminate the error of the star's place. Systematic changes of "face" and of the zero settings of the azimuthal circle were made as in the measurement of the principal angles (§ 9), but the repetitions on each zero were more numerous; the azimuthal levels were read and corrections applied to the star observations for dislevelment. As already mentioned (§ 17), the triangulation was not adjusted, in the course of the final simultaneous reduction, to the astronomically determined azimuths, because they are liable to be vitiated by local attractions; but the azimuths observed at about fifty stations around the primary azimuthal station, which was adopted as the origin of the geodetic calculations, were referred to that station, through the triangulation, for comparison with the primary azimuth. A table was prepared of the differences (observed at the origin − computed from a distance) between the primary and the geodetic azimuths; the differences were assumed to be mainly due to the local deflexions of the plumb-line and only partially to error in the triangulation, and each was multiplied by the factor

$$p = \frac{\text{tangent of latitude of origin}}{\text{tangent of latitude of comparing station}},$$

in order that the effect of the local attraction on the azimuth observed at the distant station—which varies with the latitude and is = the deflexion in the prime vertical × the tangent of the latitude—might be converted to what it would have been had the station been situated in the same latitude as the origin. Each deduction was given a weight, w, inversely proportional to the number of triangles connecting the station with the origin, and the most probable value of the error of the observed azimuth at the origin was taken as

$$x = \frac{[(\text{observed} - \text{computed})\ p\ w]}{[w]} \qquad (24),$$

the value of x thus obtained was $-1''{\cdot}1$.

The formulæ employed in the reduction of the azimuth observations were as follows. In the spherical triangle PZS, in which P is the pole, Z the zenith, and S the star, the co-latitude PZ and the polar distance PS are known, and, as the angle at S is a right angle at the elongation, the hour angle and the azimuth at that time are found from the equations

$$\cos P = \tan PS \cot PZ,$$
$$\cos Z = \cos PS \sin P.$$

The interval, δP, between the time of any observation and that of the elongation being known, the corresponding azimuthal angle, δZ, between the two positions of the star at the times of observation and elongation is given rigorously by the following expression—$\tan \delta Z$

$$= -\frac{2\sin^2\frac{1}{2}\delta P}{\cot PS \sin PZ \sin P\{1 + \tan^2 PS \cos\delta P + \sec^2 PS \cot P \sin\delta P\}} \quad (25),$$

which is expressed as follows for logarithmic computation—

$$\delta Z = -\frac{m \tan Z \cos^2 PS}{1 - n + l},$$

where $m = 2\sin^2\frac{\delta P}{2}\operatorname{cosec} 1''$, $n = 2\sin^2 PS \sin^2\frac{\delta P}{2}$, and $l = \cot P \sin\delta P$; l, m, and n are tabulated.

Height and refraction

21. *Calculation of Height and Refraction.*—Let A and B (fig. 4) be any two points the normals at which meet at C, cutting the sea-level at p and q; take $Dq = Ap$, then BD is the difference of height; draw the tangents Aa and Bb at A and B, then aAB is the depression of B at A and bBA that of A at B; join AD, then BD is determined from the triangle ABD. The triangulation gives the distance between A and B at the sea-level, whence $pq = c$; thus, putting Ap, the height of A above the sea-level, $= H$, and $pC = r$,

$$AD = c\left(1 + \frac{H}{r} - \frac{c^2}{24r^2}\right) \qquad (26)$$

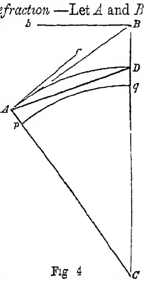

Fig. 4.

Putting D_a and D_b for the actual depressions at A and B, S for the angle at A, usually called the "subtended angle," and h for BD—

$$S = \tfrac{1}{2}(D_b - D_a) \qquad (27),$$

and

$$h = AD\frac{\sin S}{\cos D_b} \qquad (28).$$

The angle at C being $= D_b + D_a$, S may be expressed in terms of a single vertical angle and C when observations have been taken at only one of the two points. C, the "contained arc," $= c\frac{\rho + \nu}{2\rho\nu}\operatorname{cosec} 1''$ in seconds. Putting D'_a and D'_b for the observed vertical angles, and ϕ_a, ϕ_b for the amounts by which they are affected by refraction, $D_a = D'_a + \phi_a$ and $D_b = D'_b + \phi_b$; ϕ_a and ϕ_b may differ in amount (see § 10), but as they cannot be separately ascertained they are always assumed to be equal; the hypothesis is sufficiently exact for practical purposes when both verticals have been measured under similar atmospheric conditions. The refractions being taken equal, the observed verticals are substituted for the true in (27) to find S, and the difference of height is calculated by (28); the third term within the brackets of (26) is usually omitted. The mean value of the refraction is deduced from the formula

$$\phi = \tfrac{1}{2}\{C - (D'_a + D'_b)\} \qquad (29).$$

An approximate value is thus obtained from the observations between the pairs of reciprocating stations in each district, and the corresponding mean "coefficient of refraction," $\phi \div C$, is computed for the district, and is employed when heights have to be determined from observations at a single station only. When either of the vertical angles is an elevation $-E$ must be substituted for D in the above expressions.[1]

II. Traversing, as a basis for Survey.—Rectangular Spherical Coordinates.

Traversing

Traversing is a combination of linear and angular measures in equal proportions: the surveyor proceeds from point to point, measuring the lines between them and at

[1] In topographical and levelling operations it is sometimes convenient to apply small corrections to observations of the height for curvature and refraction simultaneously. Putting d for the distance, r for the earth's radius, and κ for the coefficient of refraction, and expressing the distance and radius in miles and the correction to height in feet, then correction for curvature $= \frac{2}{3}d^2$, correction for refraction $= -\frac{4}{3}\kappa d^2$, correction for both $= \frac{2 - 4\kappa}{3} d^2$.

each point the angle between the back and forward lines, he runs his lines as much as possible over level and open ground, avoiding obstacles by working round them. The system is well suited for laying down roads, boundary-lines, and circuitous features of the ground, and is very generally resorted to for filling in the interior details of surveys based on triangulation. It has been largely employed in certain districts of British India, which had to be surveyed in a manner to satisfy fiscal as well as topographical requirements; for, the village being the administrative unit of the district, the boundary of every village had to be laid down, and this necessitated the survey of an enormous number of circuits. Moreover, the traverse system was better adapted for the country than a network of triangulation, as the ground was generally very flat and covered with trees, villages, and other obstacles to distant vision, and was also devoid of hills and other commanding points of view. The principal triangulation had been carried across it, but by chains executed with great difficulty and expense, and therefore at wide intervals apart, with the intention that the intermediate spaces should be provided with points as a basis for the general topography in some other way. A system of traverses was obviously the best that could be adopted under the circumstances, as it not only gave all the village boundaries but was practically easier to execute than a network of minor triangulation.

In Indian Survey

Procedure of the Indian Survey.—The traverses are executed in minor circuits following the periphery of each village and in major circuits comprising groups of several villages; the former are done with 4″ to 6″ theodolites and a single chain, the latter with 7″ to 10″ theodolites and a pair of chains, which are compared frequently with a standard. The main circuits are connected with every station of the principal triangulation within reach. The meridian of the origin is determined by astronomical observations; the angle at the origin between the meridian and the next station is measured, and then at each of the successive stations the angle between the immediately preceding and following stations; summing these together, the "inclinations" of the lines between the stations to the meridian of the origin are successively determined. The distances between the stations, multiplied by the cosines and sines of the inclinations, give the distance of each station from the one preceding it, resolved in the directions parallel and perpendicular respectively to the meridian of the origin; and the algebraical sums of these quantities give the corresponding rectangular coordinates of the successive stations relatively to the origin and its meridian. The area included in any circuit is expressed by the formula

area = half algebraical sum of products $(x_1+x_2)\ (y_2-y_1)$ (30),

x_1, y_1 being the coordinates of the first, and x_2, y_2 those of the second station, of every line of the traverse in succession round the circuit.

Of geometrical tests there are two, both applicable at the close of a circuit: the first is angular, viz., the sum of all the interior angles of the described polygon should be equal to twice as many right angles as the figure has sides, less four; the second is linear, viz., the algebraical sum of the x coordinates and that of the y coordinates should each be $=0$. The astronomical test is this: at any station of the traverse the azimuth of a referring mark may be determined by astronomical observations; the inclination of the line between the station and the referring mark to the meridian of the origin is given by the traverse; the two should differ by the convergency of the meridians of the station and the origin. In practice the angles of the traverse are usually adjusted to satisfy their special geometrical and astronomical tests in the first instance, and then the coordinates of the stations are calculated and adjusted by corrections applied to the longest, that the angles may be least disturbed, as no further corrections are given them.

Convergency of meridians

Convergency of Meridians.—The exact value of the convergence, when the distance and azimuth of the second astronomical station from the first are known, is that of $B-(\pi+A)$ of equation (11); but, as the first term is sufficient for a traverse, we have

$$\text{convergency} = x \tan\lambda \frac{\operatorname{cosec} 1''}{\nu},$$

substituting x, the coordinate of the second station perpendicular to the meridian of the origin, for $c \sin A$.

Adjustment of traverses to triangulation

Adjustment of a System of Traverses to a Triangulation.—The coordinates of the principal stations of a trigonometrical survey are usually the spherical coordinates of latitude and longitude; those of a traverse survey are always rectangular, plane for a small area but spherical for a large one. It is often necessary, therefore, for purposes of comparison and check at stations common to surveys of both descriptions, to convert either rectangular coordinates into latitudes and longitudes, or *vice versa*, in order that the errors of traverses may be dispersed by proportion over the coordinates of the traverse stations, if desired, or adjusted in the final mapping. The latter is generally all that is necessary, more particularly when the traverses are referred to successive trigonometrical stations as origins, as the operations are being extended, in order to prevent any large accumulation of error. Similar conversions are also frequently necessary in map projections. The method of effecting them will now be indicated.

Transformation of coordinates

Transformation of Latitude and Longitude Coordinates into Rectangular Spherical Coordinates, and vice versa.—Let A and B be any two points, Aa the meridian of A, Bb the parallel of latitude of B; then Ab, Bb will be their differences in latitude and longitude; from B draw BP perpendicular to Aa; then AP, BP will be the rectangular spherical coordinates of B relatively to A. Put $BP=x$, $AP=y$, the arc $Pb=\eta$, and the arc Bb, the difference of longitude, $=\omega$; also let λ_a, λ_b, and λ_p be the latitudes of A, B, and the point P, ρ_p the radius of curvature of the meridian, and ν_p the normal terminating in the axis minor for the latitude λ_p; and let ρ_0 be the radius of curvature for the latitude $\frac{1}{2}(\lambda_a+\lambda_p)$. Then, when the rectangular coordinates are given, we have, taking A as the origin, the latitude of which is known,

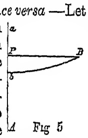

Fig. 5.

$$\left.\begin{aligned} \lambda_p=\lambda_a+\frac{y}{\rho_0}\operatorname{cosec}1'', \quad \eta=\frac{x^2}{2\rho_p\nu_p}\tan\lambda_p\operatorname{cosec}1'', \\ \lambda_b-\lambda_a=\frac{y}{\rho_0}\operatorname{cosec}1''-\eta, \quad \omega=\frac{x}{\nu_p}\sec(\lambda_b+\tfrac{1}{3}\eta)\operatorname{cosec}1'' \end{aligned}\right\} \quad (31)$$

And, when the latitude and longitude are given, we have[1]

$$\left.\begin{aligned} \eta&=\left(\frac{\omega}{2}\right)^2\frac{\nu_b}{\rho_b}\sin 2\lambda_b \sin 1'' \\ y&=\rho_0\{\lambda_b-\lambda_a+\eta\}\sin 1'' \\ x&=\omega\nu_p\cos(\lambda_b+\tfrac{1}{3}\eta)\sin 1'' \end{aligned}\right\} . \quad (32)$$

Coordinates of unvisited point

Graphic Method of Determining the Coordinates of an Unvisited Point observed from Several Stations.—When a hill peak or other prominent object has been observed from a number of stations whose coordinates are already fixed, the converging rays may be projected graphically, and from an examination of their several intersections the most probable position of the object may be obtained almost as accurately as by calculations by the method of least squares,

[1] In the Indian Survey, tables are employed for these calculations which give the value of 1″ of arc in feet on the meridian, and on each parallel of latitude, at intervals of 5′ apart; also a corresponding table of arc versines (Pb) of spheroidal arcs of parallel (Bb) 1° in length, from which the arc versines for shorter or longer arcs are obtained proportionally to the squares of the arcs; x is taken as the difference of longitude converted into linear measure.

which are very laborious and out of place for the determination of a secondary point The following is a description of the application of this method to points on a plane surface in the calculations of the Ordnance Survey Let s_1, s_2, be stations whose rectangular coordinates, x_1, x_2, perpendicular, and y_1, y_2, parallel, to the meridian of the origin are given, let a_1,a_2, be the bearings —here the direction-inclinations with the meridian of the origin—of any point P, as observed at the several stations, and let p be an approximate position of P, with coordinates x_p, y_p, as determined by graphical projection on a district map or by rough calculation Construct a diagram of the rays converging around p, by taking a point to represent p and drawing two lines through it at right angles to each other to indicate the directions of north, south, east, and west Calculate accurately $(y_p - y_1) \tan a_1$, and compare with $(x_p - x_1)$, the difference will show how far the direction of the ray from s_1 falls to the east or west of p Or calculate $(x_p - x_1) \cot a_1$, and compare with $(y_p - y_1)$ to find how far the direction falls to the north or south of p Set off the distance on the corresponding axis of p, and through the point thus fixed draw the direction a_1 with a common protractor All the other rays around p may be drawn in like manner, they will intersect each other in a number of points, the centre of which may be adopted as the most probable position of P The coordinates of P will then be readily obtained from those of $p \pm$ the distances on the meridian and perpendicular In the annexed diagram

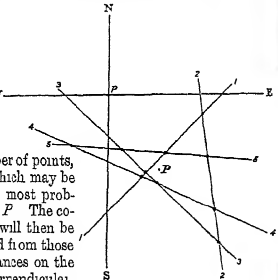

Fig 6

(fig 6) P is supposed to have been observed from five stations, giving as many intersecting rays, (1, 1), (2, 2), , there are ten points of intersection, the mean position of which gives the true position of P, the assumed position being p The advantages claimed for the method are that, the bearings being independent, an erroneous bearing may be redrawn without disturbing those that are correct, similarly new bearings may be introduced without disturbing previous work, and observations from a large number of stations may be readily utilized, whereas, when calculation is resorted to, observations in excess of the minimum number required are frequently rejected because of the labour of computing them [1]

III Levelling

Levelling Levelling is the art of determining the relative heights of points on the surface of the ground as referred to a hypothetical surface which cuts the direction of gravity everywhere at right angles When a line of instrumental levels is commenced at the sea-level, a series of heights is determined corresponding to what would be found by perpendicular measurements upwards from the surface of water communicating freely with the sea in underground channels, thus the line traced indicates a hypothetical prolongation of the surface of the sea inland, which is everywhere conformable to the earth's curvature

[1] For fuller details and an application to spherical surfaces, see *Account of the Graphic Method of the Ordnance Survey*, by J O'Farrell, London, 1886

The trigonometrical determination of the relative heights of points at known distances apart, by the measurements of their mutual vertical angles,—as already described in section I —is a method of levelling But the method to which the term "levelling" is always applied is that of the direct determination of the differences of height from the readings of the lines at which graduated staves, held vertically over the points, are cut by the horizontal plane which passes through the eye of the observer Each method has its own advantages The former is less accurate, but best suited for the requirements of a general geographical survey, to obtain the heights of all the more prominent objects on the surface of the ground, whether accessible or not The latter may be conducted with extreme precision, and is specially valuable for the determination of the relative levels, however minute, of easily accessible points, however numerous, which succeed each other at short intervals apart, thus it is very generally undertaken *pari passu* with geographical surveys, to furnish lines of level for ready reference as a check on the accuracy of the trigonometrical heights In levelling with staves the measurements are always taken from the horizontal plane which passes through the eye of the observer, but the line of levels which it is the object of the operations to trace is a curved line, everywhere conforming to the normal curvature of the earth's surface, and deviating more and more from the plane of reference as the distance from the station of observation increases Thus, either a correction for curvature (see footnote, page 705) must be applied to every staff reading, or the instrument must be set up at equal distances from the staves, the curvature correction, being the same for each staff, will then be eliminated from the difference of the readings, which will thus give the true difference of level of the points on which the staves are set up

Levelling is an essentially simple operation, but, as it has to be repeated very frequently in executing a long line of levels—say seven times on an average in every mile—it must be conducted with every precaution against errors of various kinds, instrumental and personal, some accidental and tending to cancel each other, others systematic and cumulative Instrumental errors arise when the visual axis of the telescope is not perpendicular to the axis of rotation, and when the focusing tube does not move truly parallel to the visual axis on a change of focus The first error is eliminated, and the second avoided, by placing the instrument at equal distances from the staves, and, as this procedure has also the advantage of eliminating the corrections for both curvature and refraction, it should invariably be adopted Errors of staff readings should be guarded against by having the staves graduated on both faces, but differently figured, so that the observer may not be biassed to repeat an error of the first reading in the second The staves of the Indian survey have one face painted white with black divisions—feet, tenths, and hundredths—from 0 to 10, the other black with white divisions from 5 55 to 15 55 Deflexion from horizontality may either be measured and allowed for by taking the readings of the ends of the bubble of the spirit-level and applying corresponding corrections to the staff readings, or be eliminated by setting the bubble to the same position on its scale at the reading of the second staff as at that of the first, both being equidistant from the observer

Certain errors are liable to recur in a constant order and to accumulate to a considerable magnitude, though they may be too minute to attract notice at any single station, as when the work is carried on under a uniformly sinking or rising refraction—from morning to midday or from midday to evening—or when the instrument takes some time to settle down on its bearings after being set up for observation They may be eliminated (i) by alternating the order of observation of the staves, taking the back staff first at one station and the forward first at the next, (ii) by working in a circuit, or returning over the same line back to the origin, (iii) by dividing a line into sections and reversing the direction of operation in alternate sections Cumulative error, not eliminable by working in a circuit, may be caused when there is much northing or southing in the direction of the line, for then the sun's light will often fall endwise on the bubble of the level, illuminating the outer edge of the rim at the nearer end and the inner edge at the further end, and so biassing the observer to take scale readings of edges which are not equidistant from the centre of the bubble, this introduces a tendency to raise the south or depress the north

ends of lines of level in the northern hemisphere. On long lines, the employment of a second observer, working independently over the same ground as the first, station by station, is very desirable. The great lines are usually carried over the main roads of the country, a number of "bench marks" being fixed for future reference. In the Ordnance Survey of Great Britain lines have been carried across from coast to coast, in such a manner that the level of any common crossing point may be found by several independent lines. Of these points there are 166 in England, Scotland, and Wales; the discrepancies met with at them were adjusted simultaneously by the method of minimum squares.

Sea-level. *Sea-Level.*—The sea-level is the natural datum plane for levelling operations, more particularly in countries bordering on the ocean. The earliest surveys of coasts were made for the use of navigators, and, as it was considered very important that the charts should everywhere show the minimum depth of water which a vessel would meet with, low water of spring-tides was adopted as the datum. But this does not answer the requirements of a land survey, because the tidal range between extreme high and low water differs greatly at different points on coast-lines. Thus the generally adopted datum plane for land surveys is the mean-sea level, which, if not absolutely uniform all the world over, is much more nearly so than low water. Tidal observations have been taken at nearly fifty points on the coasts of Great Britain, which were connected by levelling operations; the local levels of mean sea were found to differ by larger magnitudes than could fairly be attributed to errors in the lines of level, having a range of 12 to 15 inches above or below the mean of all at points on the open coast, and more in tidal rivers.[1] But the general mean of the coast stations for England and Wales was practically identical with that for Scotland. The observations, however, were seldom of longer duration than a fortnight, which is insufficient for an exact determination of even the short period components of the tides, and ignores the annual and semi-annual components, which occasionally attain considerable magnitudes. The mean-sea levels at Port Said in the Mediterranean and at Suez in the Red Sea have been found to be identical, and a similar identity is said to exist in the levels of the Atlantic and the Pacific Oceans on the opposite coasts of the isthmus of Panama. This is in favour of a uniform level all the world over; but, on the other hand, lines of level carried across the continent of Europe make the mean-sea level of the Mediterranean at Marseilles and Trieste from 2 to 5 feet below that of the North Sea and the Atlantic at Amsterdam and Brest,—a result which it is not easy to explain on mechanical principles. In India various tidal stations on the east and west coasts, at which the mean sea level has been determined from several years' observations, have been connected by lines of level run along the coasts and across the continent; the differences between the results were in all cases due with greater probability to error generated in levelling over lines of great length than to actual differences of sea-level in different localities.

Geoid or deformed surface. The sea-level, however, may not coincide everywhere with the geometrical figure which most closely represents the earth's surface, but may be raised or lowered, here and there, under the influence of local and abnormal attractions, presenting an equipotential surface—an ellipsoid or spheroid of revolution slightly deformed by bumps and hollows—which Bruns calls a "geoid." Archdeacon Pratt has shown that, under the combined influence of the positive attraction of the Himalayan Mountains and the negative attraction of the Indian Ocean, the sea-level may be some 560 feet higher at Kurrachee than at Cape Comorin; but, on the other hand, the Indian pendulum operations have shown that there is a deficiency of density under the Himalayas and an increase under the bed of the ocean, which may wholly compensate for the excess of the mountain masses and deficiency of the ocean, and leave the surface undisturbed. If any bumps and hollows exist, they cannot be measured instrumentally; for the instrumental levels will be affected by the local attractions precisely as is the sea-level, and will thus invariably show level surfaces even should there be considerable deviations from the geometrical figure.

IV. Survey of Interior Detail.

General principles. (1) *General Principles.*—We have seen that the skeleton framework of a survey may be either a triangulation or a system of traverses; very generally it is a combination of both. The method of filling in the details is necessarily influenced to some extent by the nature of the framework, but it depends mainly on the magnitude of the scale and the requisite degree of minutiæ. In all instances the principal triangles and circuit traverses have to be broken down into smaller ones, to furnish a sufficient number of fixed points and lines for the subsequent operations. The filling in may be performed wholly by linear measurements or wholly by direction intersections, but is most frequently effected by both linear and angular measures, the former taken with chains and tapes and offset poles, the latter with small theodolites, sextants, optical squares, or other reflecting instruments, magnetized needles, prismatic compasses, and plane tables. When the scale of a survey is large, the linear and angular measures are usually recorded on the spot in a field-book and afterwards plotted in office; when small they are sometimes drawn on the spot on a plane table and the field-book is dispensed with.

Scale. (2) *The Scale.*—In every country the scale is generally expressed by the ratio of some fraction or multiple of the smallest to the largest national units of length, but sometimes by the fraction which indicates the ratio of the length of a line on the paper to that of the corresponding line on the ground. The latter form is obviously preferable, being international and independent of the various units of length adopted by different nations. See table of maps and scales under MAP, vol. xv. p. 522. In the Ordnance Survey of Great Britain and Ireland both forms of expression are adopted, the smaller scales being 1 inch and 6 inches to a mile for provinces and counties, the larger $\frac{1}{2500}$ for parishes and $\frac{1}{500}$ for towns. In the Indian Survey the standard topographical scale is 1 inch to a mile, diminishing to ½ and ¼ inch for geographical reconnaissance, and rising by multiples of 2 to higher scales, of which the greatest, for other than city surveys, is 32 inches, for cadastral purposes. In both surveys the double unit of the foot and the Gunter's link ($=\frac{66}{100}$th of a foot) is employed, the former invariably in the triangulation, the latter very generally in the traversing and filling in, because of its convenience in calculations and measurements of area, a square chain of 100 Gunter's links being exactly one-tenth of an acre.

Ordnance Survey methods. (3) *Ordnance Survey Methods.*—All linear measures are made with the Gunter's chain, all angular with small theodolites only; neither magnetized nor reflecting instruments nor plane tables are ever employed, except in hill sketching, when bearings are taken with the prismatic compass. As a rule the filling in is done by triangle-chaining only; traverses with theodolite and chain are occasionally resorted to, but only when it is necessary to work round woods and hill tracts across which right lines cannot be carried.

Detail survey by triangles. (*a*) *Detail Surveying by Triangles.*—This is based on the points of the minor triangulation. The sides are first chained perfectly straight, all the points where the lines of interior detail cross the sides being fixed; the alignment is effected with a small theodolite, and marks are established at the crossing points and at any other

[1] In tidal estuaries and rivers the mean water level rises above the mean-sea level as the distance from the open coast line increases; for instance, in the Hooghly river, passing Calcutta, there is a rise of 10 inches in 42 miles between Sagur (Saugor) Island at the mouth of the river and Diamond Harbour, and a further rise of 20 inches in 43 miles between Diamond Harbour and Kidderpur.

points on the sides where they may be of use in the subsequent operations The surveyor is given a diagram of the triangulation, but no side lengths, as the accuracy of his chaining is tested by comparison with the trigonometrical values Then straight lines are carried across the intermediate detail between the points established on the sides, they constitute the principal "cutting up or split lines", then crossings of detail are marked in turn and straight lines are run between them The process is continued until a sufficient number of lines and marks have been established on the ground to enable all houses, roads, fences, streams, railways, canals, rivers, boundaries, and other detail to be conveniently measured up to and fixed Perpendicular offsets are limited to eighty and twenty links for the respective scales of 6 inches to a mile and $\frac{1}{2500}$

By traverses

(b) *Detail Surveying by Traverses*—When a considerable area has to be thus treated it is divided into a number of blocks of convenient size, bounded by roads, rivers, or parish boundaries, and a "traverse on the meridian of the origin" is carried round the periphery of each block Commencing at a trigonometrical station, the theodolite is set to circle reading 0° 0′ with the telescope pointing to the north, and at every "forward" station of the traverse the circle is set to the same reading when the telescope is pointed at the "back" station as was obtained at the back station when the telescope was pointing to the forward one When the circuit is completed and the theodolite again put up at the origin and set on the last back station with the appropriate circle reading, the circle reading, with the telescope again pointed to the first forward station, will be the same as at first, if no error has been committed This system establishes a convenient check on the accuracy of the operations and enables the angles to be readily protracted on a system of lines parallel to the meridian of the origin As a further check the traverse is connected with all contiguous trigonometrical stations by measured angles and distances Traverses are frequently carried between the points already fixed on the sides of the minor triangles, the initial side is then adopted, instead of the meridian, as the axis of coordinates for the plotting, the telescope being pointed with circle reading 0° 0′ to either of the trigonometrical stations at the extremities of the side

Plotting and examination

(c) *Plotting and Examination*—The plotting is done from the field-books of the surveyors by a separate agency Its accuracy is tested by examination on the ground, when all necessary addenda are made The examiner—who should be both surveyor, plotter, and draftsman—mounts the plot on his sketching block, and verifies the accuracy of the detail by intersections and productions and occasional direct measurements, and generally endeavours to cause the details under examination to prove the accuracy of each other rather than to obtain direct proof by remeasurement He fixes conspicuous trees and delineates the woods, footpaths, rocks, precipices, steep slopes, embankments, &c, and supplies the requisite information regarding minor objects—whether pit, shaft, level, spring, well, conduit, weir, quarry, refuse heap, waste, orchard, stack yard, railway, canal, manufacturing and mineral works, viaducts, bridges, tramways, plantations, &c—to enable a draftsman to make a perfect representation according to the scale of the map In examining a coast-line he delineates the foreshore and sketches the strike and dip of the stratified rocks In tidal rivers he ascertains and marks the highest points to which the ordinary tides flow The examiner on the 25 344 inch scale ($=\frac{1}{2500}$) is required to give all necessary information regarding the parcels of ground of different character—whether arable, pasture, wood, moor, moss, sandy—defining the limits of each on a separate tracing if necessary He has also to distinguish between turnpike, parish, and occupation roads, to collect all names, and to furnish notes of military, baronial, and ecclesiastical antiquities to enable them to be appropriately represented in the final maps The latter are subjected to a double examination,—first in the office, secondly on the ground, they are then handed over to the officer in charge of the levelling to have the levels and contour lines inserted, and finally to the hill sketchers, whose duty it is to make an artistic representation of the features of the ground

Indian Survey methods

(4) *Indian Survey Methods*—All filling in is invariably done by plane tabling on a basis of points previously fixed, the methods differ simply in the extent to which linear measures are introduced to supplement the direction rays of the plane table When the scale of the survey is small, direct measurements of distance are rarely made and the filling is usually done wholly by direction intersections, which fix all the principal points, and by eye sketching, but as the scale is increased linear measures with chains and offset poles are introduced to the extent that may be desirable A sheet of drawing paper is mounted on cloth over the face of the plane table, the points, previously fixed by triangulation or otherwise, are projected on it—the collateral meridians and parallels, or the rectangular coordinates, when these are more convenient for employment than the spherical, having first been drawn, the plane table is then ready for use Operations are commenced at a fixed point by aligning with the sight rule on another fixed point, which brings the meridian line of the table on that of the station The magnetic needle may now be placed on the table and a position assigned to it for future reference Rays are drawn from the station point on the table to all conspicuous objects around with the aid of the sight rule The table is then taken to other fixed points, and the process of ray drawing is repeated at each, thus a number of objects, some of which may become available as stations of observation, are fixed Additional stations may be established by setting up the table on a ray, adjusting it on the back station—that from which the ray was drawn—and then obtaining a cross intersection with the sight rule laid on some other fixed point, also by interpolating between three fixed points situated around the observer The magnetic needle may not be relied on for correct orientation, but is of service in enabling the table to be set so nearly true at the outset that it has to be very slightly altered afterwards The error in the setting is indicated by the rays from the surrounding fixed points intersecting in a small triangle instead of a point, and a slight change in azimuth suffices to reduce the triangle to a point, which will indicate the position of the station exactly Azimuthal error being less apparent on short than on long lines, interpolation is best performed by rays drawn from near points, and checked by rays drawn to distant points, as the latter show most strongly the magnitude of any error of the primary magnetic setting In this way, and by self-verificatory traverses "on the back ray" between fixed points, plane table stations are established over the ground at appropriate intervals, depending on the scale of the survey, and from these stations all surrounding objects which the scale permits of being shown are laid down on the table, sometimes by rays only, sometimes by a single ray and a measured distance The general configuration of the ground is delineated simultaneously

Checking and examination

Checking and Examination—Various methods are followed For large scale work in plains it is customary to run arbitrary lines and across it and make an independent survey of the belt of ground to a distance of a few chains on either side for comparison with the original survey, the smaller scale hill topography is checked by examination from commanding points, and also by traverses run across the finished work on the table

V REPRESENTATION OF GROUND

Main lines of ground

The master lines of ground are the main ridges and water-partings of the hills, the watercourses, and the horizontal contour lines of the coasts, the subordinate lines are those which define the undulations and minor features falling between the low-lying plains and the crests of the hills These lines must first be laid down on a horizontal projection to fix the dimensions of each feature of the ground, after which the slopes must be indicated with sufficient relief and character to present a true picture of the corrugations of surface In ancient maps the hills are represented as seen against the sky in profile by a spectator standing on the ground below at some distance off This system of "natural representation," as it was called, was serviceable in enabling persons looking at the hills from the quarter from which they had been sketched to identify them readily, for which reason such views of distant inland hills are still commonly given on the margins of marine charts of coast-lines for the assistance of navigators But, when all other objects except the hills are shown in a map by their horizontal projections, hills represented in perspective are false to their surroundings, and misleading to all who approach them from other directions than that of the adopted point of view, for the vertical projection of the profile is practically turned over and confused with the horizontal plane Hence in course of time hills came to be drawn as if seen from a high bird's-eye point of view, the position of which was shifted until at last the point of sight was supposed to be vertically over them, thus the evils of the perspective system were diminished, whilst something of natural representation was still preserved About the end of the 18th century the perspective and the bird's-eye systems gave way to the true method of indicating the forms of hills, viz, by their horizontal projections, like all the other details of the ground, and by adding the requisite shading to bring every feature into proper relief

Hill-shading

Hill-Shading—There are two rival methods of hill-shading,—one by horizontal contours, the other by vertical hachures A contour being the line of intersection of a hill

by a horizontal plane, contour lines indicate the markings which would be made by the successive risings of a flood to different levels above the sea, vertical hachures indicate the directions which the particles of a volume of water, equally disseminated over the top of a hill, would naturally take in running down the sides and slopes The most perfect representation of ground is obtained when the shade lines, whether horizontal or vertical, are sufficiently close and well graduated in tone and intensity to imitate good mezzotint shading in Indian ink A good effect may be and is frequently produced by assuming light to fall on the hills obliquely from a specific direction, illuminating them on one side and throwing the reverse slopes into shadow But this has the disadvantage of giving similar slopes different intensities of shade according to their position with reference to the assumed direction of the light, on the other hand, vertical lighting, which gives the same intensity to the same slope wherever situated, fails in relief and perspicacity A commission of citizens appointed by the republican Government of France in 1803 to formulate rules on the subject of topography, condemned the representation of hills in demi-perspective as absurd, but approved the system of oblique side-light, it also condemned contours, except for engineering works, and recommended vertical hachures, under the idea that the slope lines of the fall of water represent a material effect of which the eye is witness every moment, and recalls the general cause, if not of the formation, at least of the figure and characteristics, of the mountains

Scale of shade

Scale of Shade.—For military purposes it is very desirable that maps should be so drawn as to enable the angles of inclination of all slopes to be readily ascertained, with a view to determining what portions of the ground are suited for the manœuvres of each of the three arms,—infantry, cavalry, and artillery Thus military topographers of different nationalities have proposed a variety of scales to regulate the thickness and distance apart of the shade lines, and generally the proportion of black to white, for different angles of slope, that the map may convey to the mind as accurate a knowledge of the slopes of the ground as of the horizontal outlines All slopes, however, are not of equal practical importance, but only those which are of most common occurrence and most liable to be gone over by men and horses and wheeled vehicles, and their inclination rarely exceeds 25°, consequently it is of most importance to be able to distinguish variations of slope below that angle It is occasionally desirable to know the sharper slopes up to 45° or 50°, but greater inclinations are comparatively of rare occurrence and unimportant Now in a true scale of shade the intensity increases with the inclination from 0° to 90°, thus, putting black + white = 1, the proportion of black to white for any inclination i by a scale of cosines will be black $= 1 - \cos i$, white $= \cos i$ But that scale does not sufficiently accentuate the lower inclinations, which are the most important, and have therefore to be dealt with more emphatically, this has led to the introduction of a variety of conventional scales, each with the special characteristics which commended themselves to its author Major Lehmann of the German army supposed light to be admitted in parallel vertical rays and gave the horizontal plane the fullest light, because the reflected coincides with the vertical ray, at an inclination of 45° the reflected ray is perfectly horizontal, and this slope was therefore least illumined Disregarding all greater slopes, he placed 45° at the head of his scale and represented it by absolute black, the scale was divided into nine equal parts of 5° each, from 0° to 45°, up to which the illumination varies inversely as the angle of inclination General van Gorkum of the Netherlands army improved on Lehmann's system he adopted certain groups of contours arranged according to the slope, making the vertical distances between the contours equal in each group but greater in the higher groups, and between the contours he drew vertical hachures the lengths of which showed by reference to a scale the angles of slope His lowest group included all angles up to 25°, the vertical distance between the contours being so regulated with reference to the scale of the map as to permit the draftsman to represent the slopes without inconveniently long hachures For higher angles he doubled and trebled the vertical interval of his contours and the thickness of his hachures Thus the relative altitudes of any required points might be deduced with comparative facility by noting the thickness and counting the number of the vertical hachures between them In this respect the system satisfies the requirements of a military map, but the effect is unpleasing and unsuggestive of hill forms In 1828 a second French commission, having Laplace for its president, was appointed to report on topographical drawing It reversed the decision of the first commission in favour of oblique side light, as being difficult to execute and inaccurate in giving different intensities to the same angles of slope facing differently, and, after trying various scales of shade, it determined to increase the intensity in proportion to the sines of double the angles of inclination diminished by $\frac{1}{15}$, which gives a more rapid increase of shade for the gentle than the steep slopes In subsequent instructions of the "depôt de la guerre" the proportion of black to white is fixed at one and a half times the angle of slope In England various scales of shade have been proposed, by Colonel Scott and Captain Webber of the Royal Engineers, and by the Council of Military Education Colonel Scott's scale is interesting as having been derived from the average of measurements taken from the best examples of hill sketching in the Ordnance and other surveys, whereas all the others were deduced from a conventional application of geometrical principles The following table (III) gives the several scales —

Table showing the Proportion of Black to White on any Unit of Area, in Horizontal Plan

Angle of Slope	Scale of Cosines		Major Lehmann		First French		Second French		Colonel Scott		Captain Webber		Council of Military Education

Mezzotint shading.

Of late years the system of shading by lines has been abandoned for the English army, and a method of representing slopes by mezzotint shading over a few governing contour lines, laid down by actual survey, has been introduced instead The effect aimed at is a transparent shade, dark in proportion to the steepness of the ground represented, its object is to give body and expression to the contours and to explain and develop minor features of the ground which may lie between them This style of shading, being distinct from all line drawing, may be applied over the most crowded details without causing confusion, such as would be produced by hachure shading The contours are indicated by continuous red lines of constant thickness, strong enough to be everywhere visible through the shading, which is effected by applying lead with a soft pencil over the parts where it is wanted, and then rubbing it in firmly with a piece of chamois

leather folded into a small pad No pencil marking is allowed, lightening is done with india-rubber, the shading is finally fixed with a wash of thin gum-water

It is to be noted that the several scales of shade above given were devised for military maps to be drawn on a scale of not less than 4 inches to the mile and possibly much greater The harshness and mannerism to which all line-shading by rule is liable are of less importance in maps of small areas represented on large scales than on maps of large areas on small scales In the former the sacrifice of pictorial effect is more than compensated by the additional information regarding the slopes of the ground, in the latter any attempt to introduce so much information would tend to crowd the map objectionably, and confuse the vertical with the horizontal details The smaller the scale of a map of hill country the more necessary it is to abandon mechanical conventionalism, and to aim at achieving an artistic representation which will convey an immediate and accurate impression of the general character of the ground

In India the topography has been mainly executed on scales of or less than 1 inch=1 mile and rarely exceeding 2 inches, and, as the range of altitude varies considerably in different parts of the country, from plains and undulations little above the sea level to mountains rising to an altitude of 29,000 feet, scales of shade were long deemed wholly unsuitable for employment The higher mountains had necessarily to be brought into prominence over the lower by giving them a darker shade than was due simply to their slopes, and similarly the elevated plateaus had to be more lightened and illuminated than the low-lying plains But in course of time, as the number of hands employed in the operations increased more rapidly than the available supply of artistic draughtsmen, the introduction of a scale of shade became necessary, in order that the multitude of workers might be put more nearly on a par with the few For men who have been accustomed to associate a certain depth of shade with a certain angle of slope will work together within narrower limits of error and divergence than if left entirely to their own unaided judgment and untutored proclivities The field sketchers should therefore learn to work on a system which gives every hachure line a definite meaning, so that their sketches may be rightly interpreted and appropriately translated and rendered in the final representation of the ground, when it is the duty of the draughtsman to enhance the tone of the map as much as possible while maintaining its truthfulness

Ordnance Survey delineation of ground

Ordnance Survey System of Delineating Ground —As a rule the features of the ground are sketched in the field on the 6-inch scale, and afterwards reduced and published on the 1-inch scale The Highlands of Scotland were sketched partly on the 1-inch and partly on the 2-inch scale, in Ireland the 1 inch scale only was used, and this scale is now being adopted for hill sketching in England and Wales In the parts where the 6-inch scale was used the ground was first contoured instrumentally, a plan of the contours and of all surveyed outlines was supplied to the sketcher, who proceeded to insert the hill features with the aid of a prismatic compass, protractor, plotting scale, and a "hill sketcher's scale," graduated to show the horizontal intervals between the contours which correspond to various angles of inclination from 0° to 45° He was required to delineate slopes up to 45° by horizontal hachures, and slopes beyond 45° by vertical hachures The thickness and number of the strokes, the relation to light and shade, and the character of the touch were left to the skill and experience of the sketcher The introduction of scales of shade adapted to various inclinations and altitudes was frequently mooted, with a view to securing greater uniformity, but no such scale was adopted, for it was found that, though at first different workmen produced different results, long practice and constant comparison, together with the aid derived from the instrumental contours, effected all desirable uniformity Thus in good sketches it was found that the maximum breadth of stroke used in the representation of very steep mountain slopes was $\frac{1}{75}$ inch, and the minimum used in low and nearly flat country, $\frac{1}{300}$ inch, also that the average proportions of light to shade were 1 to 3 at the maximum and 25 to 1 at the minimum inclinations In the field sketches the light is supposed to fall vertically, and all slopes of like altitude and inclination are similarly expressed The 6 inch sketches are reduced to the 1 inch scale for publication by an artist working with Indian ink and the camel-hair brush on an impression in outline of the 1-inch map He makes a careful study of the several sketches which he has to combine together, in order to determine which features should be retained and which omitted in the reduction, and he divides the ground into zones of different altitude to guide him in giving a strength of shade proportioned to the altitude rather than to the slope as in the field sketches, and in drawing he increases the contrasts between light and shade and introduces light from a corner of the map to give a stronger relief, and to attract the eye to the highest points and enable it to distinguish readily the higher from the lower ground His general aim is to produce a more pictorial and less mechanical study of the ground than is supplied by the field sketches Many exquisite maps have been thus produced and afterwards engraved, see sheets 32, 33, 38, 53, and 64 of Scotland, 38 and 48 of England, 75 of Wales, 93, 94, 191, and 192 of Ireland. These sheets, however, though admirable specimens of engraving, fall short of the original drawings in tone and relief, for in them the hill shading is necessarily shown by line-etching, and it does not produce such effective contrasts and gradations of light and shade as the original brush work[1]

Instrumental contouring

Delineation by Instrumental Contouring —A very precise knowledge of the configuration of surface may be acquired by carrying true contour lines over the ground and projecting them on the map of the survey But the contours do not give a true representation of the ground, for they seldom represent actual lines on the surface, as do the lines on the map which indicate roads, watercourses, walls, enclosures, &c, they give, however, a conventional representation which is sufficient *per se* for the engineer and the expert, and they furnish guiding lines for all shading, whether by hachures or mezzotint, which may be subsequently executed to produce an artistic delineation of the features of the ground In instrumental contouring we have first to decide on the vertical intervals to be maintained between the contours They depend on the scale of the survey and the nature of the ground In the Ordnance Survey they are made as small as from 5 to 10 feet, when special plans on large scales are being prepared for engineering requirements, but for the general maps they are 50 feet up to an elevation of 100 feet above the sea-level, and 100 beyond up to 900 feet, which elevation, being the practical limit of cultivation, is the highest generally marked, though in the northern counties of England and in parts of Scotland additional contours have been executed at the altitudes of 1000, 1250, 1500, 1750, 2000, 2500, 3000, &c, feet The intervals having been determined on, instrumental levelling is commenced at either the top or the bottom of those slopes which best define the general lay of the ground, or at some previously established bench mark of which the height above the sea is known Points are marked out on the slopes with pickets at the prescribed vertical intervals, and then the contour lines of the horizontal planes passing in succession through each of these points are traced with a levelling instrument and staff and surveyed by traverse, the two processes being performed either simultaneously or consecutively as may be most convenient

The instruments generally used in the Ordnance Survey are a 5 inch theodolite—employed as a levelling instrument—and a contouring staff, 8 feet long, provided with a sliding vane which may be fixed at any required height, the staff is shifted about until the vane is brought into the horizontal plane of the theodolite, when the bottom of the staff will be on the contour line A serviceable contouring instrument of very simple construction is the water-level, which consists of a pair of transparent phials partially filled with water, the phials are placed upside down at the ends of a hollow bar fixed on a rotatory vertical axis, and have their mouths connected with piping of any available material,—brass, tin, or gutta-percha The water in both phials is in free communication, and the water surfaces indicate the horizontal plane naturally, without any mechanical contrivance The instrument is well suited for short sights not requiring a telescope, and may be readily manipulated by persons ignorant of the use of instruments of a higher class Eye-reflecting levels, clinometers, orometers, and other light instruments, which may be held in the hand and do not require a fixed support, are frequently employed for interpolating minor between major contours In military sketching on large scales hypothenusal inclinations and lengths are sometimes measured, the bases and perpendiculars are deduced on the spot from a table

[1] With certain exceptions, principally of a military nature, the hill features are now sketched on the 1 inch scale, on photographic reductions of the 6 inch contoured sheets, faintly printed in orange colour, as a guide to the sketchers

of gradients, and then the contour lines, and the orthogonals also if required, are laid down

VI Geographical Reconnaissance

Geographical reconnaissance

When a traveller passes through an unknown or little known region the opportunity afforded him of acquiring some new geographical knowledge depends largely on the configuration and aspects of the ground, the condition of the atmosphere, the attitude of the inhabitants, and the time available If hills are numerous and prominent and free from forest, and other conditions are favourable, a large area may be covered in a short time by reconnaissance from the stations of a chain of triangles carried along the line of route, fixing points in advance, some of which become stations of observation whence further points are fixed, and thus the continuity of the operations is maintained But the ground may be flat and devoid of prominent points, the view circumscribed by forests and other obstacles, the atmosphere dense and unfavourable for distant vision, the inhabitants hostile, and the time short, and the traveller may be restricted to his line of route and unable to deviate from it, he must then endeavour to maintain a continuous traverse of the route, sketching in the ground in its immediate vicinity Whenever breaks of continuity occur he must resort to astronomical observations to effect a connexion between the dissociated sections of his survey and to obtain an independent check on the general accuracy of the operations He has therefore to be prepared to measure base-lines, to carry on a triangulation in some regions and a traverse in others, and to make any astronomical observations which may be wanted, and, if possible, to complete his mapping on the ground instead of postponing it to be done elsewhere He should supply himself with some instruments suited for rough and rapid work and with others for better work when time and opportunity permit, and he should be careful to arrange beforehand the general character of the proposed operations and the scales and projections to be adopted for the mapping, he should also provide himself with blank sheets of paper duly graticulated to scale, for work in detail in the vicinity of the line of route and for general geography For measures of base-lines and distances on the ground, chains, rolls of crinoline wire, long Assam canes, and perambulators may be employed, also omnimeters and subtense theodolites, to measure the angle subtended by a pole of known length, whence the distance may be deduced For measures of angles and bearings, either theodolites,[1] or sextants, or prismatic compasses may be used, according as more or less accuracy is required For the general survey the plane table is a most valuable instrument it enables bearings to be at once laid down on the paper without previous measurement, and much detail to be sketched in on the spot, instead of being plotted subsequently from a field-book, then the only independent angular measurements which need be taken are those of the principal triangles and of very distant points beyond the range of the table Rough and rapid route surveys may be made by pacing the distances, taking the magnetic bearings, and combining with the results of astronomical observation Many thousand miles of itinerary through regions in Central Asia have been surveyed by Asiatic employés of the Indian Government in this way, the northings and southings were controlled by latitude observations, and the factors thus obtained were applied to the eastings and westings, longitudes being impracticable The theodolite should be employed to fix points on very distant ranges, for it will give good results, even with short bases and very acute angles, provided the objects actually observed are well identified in each instance Observations should be taken from three stations, giving two triangles with a common side, which will at once show up any mistake, whether of identity, circle reading, or calculation Whenever a break of continuity occurs in the triangulation or the traversing, astronomical observations must be resorted to Much may be done by a judicious introduction of latitudes and azimuths, more particularly where there is considerable northing and southing, for then differences of longitude may be obtained from the azimuths and differences of latitude A prominent peak, visible from great distances all round, may be made to serve as a connecting link between regions which cannot be continuously connected, by measuring its azimuth and distance from a base-line in each region, the addition of latitudes at the azimuth stations will much strengthen the work

Collateral Astronomical Determinations —Determinations of azimuth, latitude, time, and longitude may all be required for geographical reconnaissance,—the first two more particularly, as they can be obtained readily with much accuracy, the fourth, being much the most troublesome to get and the least reliable when got, is only resorted to when it cannot be dispensed with

The azimuth of an object may be determined without calculation by observing the angles between the object and a star at equal altitudes on opposite sides of the meridian, but it is generally found by observing the angle in one position of the star and applying thereto the azimuth of the star as obtained by calculation In the spherical triangle PZS, in which P represents the pole, Z the zenith, and S the star, the angle PZS is the star's azimuth, which can be computed when any three parts of the triangle are given PS, the polar distance of the star, is given by the tables, and PZ, the co-latitude, must be previously determined, then, for the third part, we may have either (1) PSZ, a right angle, by observing a circumpolar star at its maximum elongation, or (2) the hour angle P for any star, by taking the time of the observation, or (3) the zenith distance ZS, by measurement simultaneously with the horizontal angle Of these three methods the first is the most accurate, but it is not always convenient, the second requires, in addition, special observations for time, the third is generally the most convenient, for it may be performed between sunset and dark, when the stars are coming into view, but when there is still sufficient light to illuminate the wires of the telescope and the referring mark, and thus enable lamps to be dispensed with Azimuth

Fig 7

The latitude is most readily determined by measures of stars' zenith distances on the meridian, duly corrected for refraction, then, the polar distance being known, the latitude is at once ascertained The stars should be observed in pairs of nearly equal zenith distance, north and south, for this eliminates all constant instrumental errors, as of index, excentricity, and graduation, and also errors in the adopted refractions When a single star is employed, circum-meridian observations of zenith distance may be taken and reduced to the meridian by calculation, tables for the pole star are given in the *Nautical Almanac*, which enable an observation, taken at any known time in the 24 hours, to be reduced to the pole Latitude.

[1] In many respects a theodolite is more suitable than a sextant (1) it measures horizontal angles directly, whereas the sextant measures oblique angles, which have to be reduced to the horizon, (2) it measures a round of several angles with much greater facility, (3) it measures all vertical angles with equal facility, including the small elevations and depressions of distant peaks which cannot be readily seen by reflexion from mercury for measurement with a sextant, (4) its telescopic power is usually far higher, (5) it may be so manipulated as to eliminate the effects, without ascertaining the magnitudes, of the constant instrumental errors,—excentricity, index, and collimation, and (6) when much accuracy is required the influence of graduation errors may be greatly reduced by systematic changes of the settings of the horizontal circle

Time The time is usually best determined by measuring the zenith distances of stars situated not far from the prime vertical; then, the latitude and polar distance being known, the hour angle P of the spherical triangle is found by calculation. Time may also be determined by observing the transits of stars over the wires of the telescope of a theodolite set up in the meridian.

Longitude The longitude may be determined either absolutely, by purely astronomical methods, as by observations of the moon's motion, or differentially, with the aid of telegraph lines and travelling chronometers. Absolute longitude is the geographer's great difficulty; for much time must be devoted to the observations, and much more to their reduction, when undertaken with the object of fixing the relative positions of the stations of a survey. The observations are of various kinds,—(1) lunar distances, *i.e.*, the distance between the moon and the sun or one of the stars given for this purpose in the *Nautical Almanac*; (2) lunar zenith distances, observed at points of the moon's path where the conditions are favourable; (3) lunar transits over the meridian, observed with transits of the moon-culminating stars given in the *Nautical Almanac*; (4) lunar occultations of stars; (5) eclipses of the sun and moon; (6) eclipses of Jupiter's satellites. The first method requires the employment of a sextant or other reflecting instrument; the second may be accomplished with either a reflecting instrument or a theodolite; the third with a theodolite; for the last three a good astronomical telescope is wanted. The first, when carried out strictly, requires three observers,—one to measure the lunar distance, while the others are measuring the zenith distances of the moon and the star; but, as the last two are not wanted with great accuracy, the several observations may be taken in succession by one person, and the observed zenith distances afterwards adjusted to the time of the lunar distance.

The effects of errors of observation in these methods are as follows. In (1) an error in time produces the same error in the longitude, and an error of one second of arc in the distance produces two seconds in time in the longitude. In (2) an error of one second in time produces at least thirty seconds of time error in the longitude, and one second of arc in the zenith distance at least two seconds of time in the longitude. In (3) to (6) an error of time produces the same error in the longitude. The first method is preferred by seamen and travellers, who are more expert in the use of the sextant than of the theodolite. The second method is preferred by those who are more familiar with the theodolite, and who are equipped with one of good telescopic power. It gives very good results when the observations are made at the most favourable time, which occurs when the resultant of the moon's motion in right ascension and in declination lies in the direction of the observer's zenith; this time may be readily found by graphical projection on a chart of the heavens.

Differential longitude Differential longitude may be determined chronometrically, on land as at sea, by carrying about several well-rated chronometers and comparing their times with the local times deduced from observations of the sun and stars; or electro-telegraphically, by interchanging signals between two stations connected by a telegraph wire, and ascertaining the local times at which the signals are transmitted from and received at each station.

Hypsometry *Hypsometry*.—Determinations of height form a very necessary part of geographical reconnaissance. Whenever triangulation is possible, vertical angles may be measured and the heights ascertained in regular succession. But in a traverse this is scarcely practicable; breaks of continuity in the verticals are liable to be of frequent occurrence, and then recourse must be had to observations of the pressure and temperature of the atmosphere, or of the temperature of the vapour of boiling water, from either of which fairly correct heights may be deduced differentially under normal atmospheric conditions in settled weather. The instruments employed for this purpose are mercurial and aneroid barometers and boiling-point thermometers; descriptions of them, and the formulæ employed in reducing the observations, are given under BAROMETER (vol. iii. pp. 381-387). Here it is only necessary to add that the date and hour of every barometric observation should be recorded, and the observations referred for reduction to those taken at the same time at one or more of the nearest standard meteorological observatories; otherwise corrections should be given to the barometer readings for the hour of the day and the month of the year, in order to reduce them as nearly as may be to the local mean altitude of the mercury. The index errors of aneroid barometers, being liable to variations, should be determined from time to time by observations at stations of known altitude, or by comparisons with boiling-point thermometers.

VII. NAUTICAL SURVEYING

Nautical surveying Nautical surveying has for its object the determination of the configuration of land which is covered and concealed from view by water, more particularly along the foreshore of a coast-line, and wherever navigation is carried on in comparatively shallow waters and a knowledge of the depth of water is of great importance; it has likewise to lay down the positions of oceanic islands, shoals, and rocks, and generally to delineate whatever land exists immediately above or below the surface of the ocean. Its methods differ according as they are performed in or out of sight of land. When in the vicinity of land it is preceded by a survey of the coast-line and a belt of the country beyond, which must be of sufficient breadth to furnish suitable points of reference for the survey operations on the water, and may have to be extended inland to embrace those peaks of distant hill ranges which are prominent objects at sea for the guidance of mariners. This done, the nautical survey is carried on in boats, by taking soundings and determining the positions of the boats by observations to some of the points already fixed on land. The observations are necessarily made with sextants and magnetic compasses only. With the former the angles between conspicuous land-marks are measured, and, as the angle between any two points is half the magnitude of the angle between the same points at the centre of the circle which passes through them and through the boat, the measurement of two angles between three points enables two circles to be drawn on the chart, the intersection of which will generally indicate the position of the boat with sufficient accuracy. Occasionally, however, it happens that the positions of all three points on shore and the boat also lie actually, or very nearly, on the circumference of one and the same circle; then a bearing taken with the compass will fix the position of the boat on the circumference of the circle. Time is noted whenever soundings are taken, that due allowance may be made for the rise and fall of the tide. All the sounding stations are not fixed by observations to points on shore, as just indicated, but only a certain proportion, and between them straight lines of sounding are run, with intervals measured either by a patent log, or by time, or by counting the strokes of the oars; whenever possible the lines of sounding are carried parallel to each other. Sounding is the most important part of a nautical surveyor's duty and that on which his character mainly depends. It is essentially the work of the sailor, for in carrying it out the accidents of wind and water—the direction and force of the wind, the rise and fall of the tide, and the velocity of currents—must be duly taken cognizance of and the work managed to suit wind and weather; on the other hand, the work on land may be done by landsmen. Nautical surveying, out of sight of land, rests on astronomical determinations of latitude and time, chronometric longitudes, and dead reckoning by log

When triangulation is resorted to, base-lines are measured sometimes with a patent log, sometimes by sound, by noting the interval in time between the flash and the report of a gun. The great length of modern ironclads presents a base-line which is occasionally very convenient: points are taken at each end of the ship, as far apart as possible, from which two observers can see each other; they are carefully marked, and the distances between them determined for future reference; then angles between moderately distant objects and observers standing at these points, taken simultaneously from each point, enable the required distances to be obtained. The magnetic variation is determined by observing the azimuth of the sun, when on or near the horizon, with a standard compass fixed amidship, care being taken beforehand to determine any deviation of the needle which may be due to the attraction of the surrounding ironwork, by observing the bearing of a distant mark as the ship is swung round and her head laid on different points of the compass. See also NAVIGATION (Practical), vol xvii p 264

VIII. MAPPING

Graticulation. *Graticulation.*—The sheets of paper on which the details of the survey of any large area of country are to be laid down must be furnished with a system of conventional lines, drawn with a view to assimilate the margins of contiguous sheets and to form a graticulation within which the details may be accurately inserted. The graticule is sometimes rectangular, sometimes spherical, sometimes a combination of both, as when points of which the latitude and longitude coordinates are given have to be plotted within rectangular marginal lines. Spherical graticules are constructed in various ways, usually in accordance with some specific method of projection; see GEOGRAPHY (Mathematical), vol x p 197. The following convenient method is not referable to any demonstrated projection, but is generally employed on the Indian Survey. Suppose the intersection of two meridians by two parallels to form a small spherical quadrilateral, with sides of aliquot parts of a degree in latitude and in longitude; let m be the length of each of the meridional arcs, p, p' the lengths of the arcs on the upper and lower parallels, and let q be a diameter, then

$$q=\sqrt{m^2+p\,p'},$$

thus, m, p, and p' being given, q is calculated. With these data, which are tabulated for different arcs and scales, the corner points of a number of quadrilaterals are laid off in succession on either side of an adopted meridian, and lines are drawn through the points to indicate the collateral meridians and the parallels of latitude. The latter are always curved, more or less sensibly; the former are also curved, though in a much less degree, being concave to their initial meridian, and the more so the farther they are from it. When the area is small and the scale large, the meridians are practically straight lines, and the several sheets of a map, each projected on its own meridian, will fit together closely when carried on in any direction. But, when the area is large—exceeding 8 or 10 square degrees—and the scale small, the sheets will not fit together continuously unless they are projected with reference to a single meridian for the whole map, to which the meridians on either side will be increasingly concave, or unless all the meridians are made straight lines, by slightly contracting each of the intermediate arcs of parallel to a length which is exactly proportioned to the lengths and relative distances of the upper and lower parallels of the map from it. There must be some distortion in either case: in the first, meridians which are actually straight lines are represented as being curved; in the second, straight meridians are obtained, but the distances between them are exact only on the upper and lower parallels, and are too small elsewhere, more particularly on the middle parallel, the length of which necessarily exceeds the mean length of the upper and lower parallels.[1] But distortion is inevitable whenever a spherical surface is projected on a plane.

When a map is constructed in rectangular sheets, some station is adopted as the origin and its meridian as the principal axis, to which the corner points of the sheets are to be referred; the coordinates of these points are given such dimensions as are most suitable for the size and scale of the map, and are equivalent to the rectangular spherical coordinates of imaginary points on the curved surface of the earth, at corresponding distances from the origin and its meridian. These being given, the distances of the points from the origin in latitude and longitude may be computed, as already shown (p 706); thus data become available for projecting the graticulation of meridians and parallels within the rectangular marginal lines of each sheet, or for introducing the divisions of latitude and longitude on the marginal lines if preferred. Conversely, when the latitudes and longitudes are given, the rectangular spherical coordinates are computed and the marginal lines projected around the graticulation. Filling in is then commenced: the principal stations are laid down by their coordinates and the topographical details pencilled around them by copying or tracing the field sheets of the survey; the names and the outlines are then inked in; the shading for delineating the features and general configuration of the ground is usually done last of all. The manner in which the details are inked in and rendered permanent depends on whether the map is to be reproduced by hand only—as when it is to be engraved or lithographed—or whether in its reproduction photography is to be employed and the action of light invoked, either in entire supersession of or in partial co-operation with the labour of the draftsman. In the former case the map is made as perfect a pictorial representation of the surface of the ground as possible, the hill features being represented artistically in mezzotint shading with a brush or in chalk drawing, and a variety of colours used to facilitate discrimination of differences of topographical detail. In the latter no colours are used which will not photograph well, nor flat shades of any colour, nor—as a rule—mezzotint shading, but only some substitute therefor in pen and ink. This last condition is essential for the commonly employed processes of photozincography and photo-lithography; but endeavours have recently been made, with some degree of success, to reproduce mapping in middle tones by the processes of photo-collotype and photo-gravure.

Photography in mapping. Photography is much employed as an auxiliary in mapping; for when a map is to be published on various scales the hand-drawn details of the largest scale edition may be reduced by its means as accurately as by the familiar pantagraph, and of course very much more rapidly. Thus in the Ordnance Survey town maps on the scale of $\frac{1}{500}$ are reduced to the scale of $\frac{1}{2500}$ for incorporation into the parish maps; the latter are reduced for insertion in the 6-inch maps, and they in turn for the 1-inch map. By limiting the dimensions of each sheet for reduction to 3 feet by 2, and by a judicious use of stops to lenses, the reductions are made without any error in scale or any distortion that can be detected by the most rigid examination. But photography reduces every part of the original alike, the printing of words and names as well as the topographical details, and it reproduces all the minor and less import-

[1] In Mr O'Farrell's pamphlet *On the Construction and Use of the Six Sheets of Marginal Lines for Maps of every part of the World*, published by the Ordnance Survey, tables are given of the lengths of meridional and longitudinal arcs, their versines and diagonals, for every ten minutes in latitude from the equator to 80° N. and 80° S

ant as well as the more important features, hence a reduction is rarely suited for reproduction without intermediate modification, the printing being generally too small to be easily legible, and the mass of minor detail tending to confuse the principal sub-lines The draftsman is therefore called in and the procedure so arranged as to obtain the best results with the least labour Either he may construct a new map by tracing from a silver print of the photograph whatever topographical details are required for it and omitting the rest, or he may ink in such details at once with black ink on a blue print taken from a transfer of the photograph to stone or zinc, in both cases adding names and writing of appropriate sizes, either result may be reproduced by photography, as the unblackened details of the blue print will disappear in the process This done, a transfer to stone or zinc may be made from the second photograph for the printing off Prints from photographic reproductions to full scale exhibit all the blemishes of the hand drawing and somewhat exaggerate them, whereas prints from photo-reductions are freer from blemish, and often as clear and sharp as good hand lithographs In employing a process of double photography, therefore, the first photo is usually made on a larger scale than that for publication, the lines of the printing and topographical detail are correspondingly exaggerated by the draftsman, and then the second photo is a reduction, which should be sharp, clear, and free from blemish

IX Map Printing

Various processes are employed for the reproduction of maps in large numbers for general issue, some are purely manual, the map being redrawn by hand on copper, stone, or other substance presenting a suitable surface from which prints may be taken, or on paper specially prepared for transfer to such substance, others are carried out with the aid of photography, whereby an exact copy of the original can be obtained either directly upon, or for subsequent transfer to, the surface to be printed from The former include the processes of copper plate engraving and lithography, which are the oldest, and still in some respects the best of all, but slow and expensive, the latter include the processes of photo-lithography, photo-zincography, photo gravure, and photo collotype Engraving on stone is much employed on the Continent for map work, being cheaper and quicker than engraving on copper Electro-metallurgic processes are frequently employed in connexion with copper plate engraving, either to protect and harden the surface of the plate with a facing of steel or to furnish duplicates to be printed from, instead of the plate itself being used, sometimes the wear of the plate is prevented by transferring a print from it to a lithographic stone or a zinc plate, from which the printing is done in its stead By the anastatic process an old print of a map may be transferred to a zinc plate to be printed from

Engraving Engraving may be performed on copper, wood, zinc, or stone, see vol viii p 435 As done on copper plate for mapping, it is a combination of ploughing with the burin and etching with an acid, the former being used for the names and topographical outlines, the latter for the features of the ground The system adopted in the Ordnance Survey of Great Britain—where it has been largely employed and carried to great perfection—is as follows The 6 inch maps of the survey are engraved on copper plates measuring 36 by 24 inches within the marginal lines and weighing about 35 lb, the 1-inch maps are 18 by 12 for England and 24 by 18 for Scotland The corners of the maps, the prescribed marginal subdivisions, and the trigonometrical points are first marked on the plate by a scoring machine, in which it is laid, and which is provided with a travelling carriage holding a steel pricker The carriage is moved along a graduated scale and the pricker along another scale at right angles to the former, and all points of which the rectangular coordinates are known are laid off by vernier read measurements from the two scales The plate is then removed from the scoring machine, heated, and given a thin coating of white wax, to form a surface on which the topographical details are plotted before the graving is commenced This surface is divided into a number of rectangles by fine lines joining marginal subdivisions, the distances between which are usually so regulated as to introduce sixteen of the survey sheets on the $\frac{1}{2500}$ scale into one sheet on the 6-inch scale The reductions to this scale are made by photography, and the subsequent reductions to the 1 inch scale either by the pantagraph or by photography Tracings of the reductions in lamp black, made to fit into the rectangles, are transferred to the wax ground by rubbing with a steel burnisher The plate is then ready to be placed in the hands of the engravers, who complete first the outlines, then the printing and writing, and afterwards the ornament, each class of work being usually done by a different person The figures of latitudes, longitudes, and altitudes, and various conventional symbols, are stamped with steel punches Parks and sands are ruled with a dotting wheel, and buildings shaded in lines with a ruling machine When a plate of the 1 inch map is being engraved, all the printing is completed, and line engraving with the exception of the contour lines, and then an electrotype duplicate of the plate is taken The contour-lines are engraved on the duplicate, and the hills are etched on the original plate, thus two editions of the map are obtained, one with contours but without hills, the other with hills but without contours, the topographical details and writing being the same in both In etching, the surface of the plate is thinly coated with an acid-resisting substance composed of asphalt, Burgundy pitch, and virgin wax, forming an etching ground, on which the outlines of the hill features are traced, and then marked through with a needle which removes the ground where it passes, exposing the surface of the copper Aquafortis is applied to bite in the finer lines and then poured off, the parts which are bitten sufficiently are painted over with "stopping varnish", and acid is again applied The processes of stopping out and biting in are alternately repeated until all the required tints from the lightest to the darkest are produced In printing from a copper plate, a much more powerful press has to be used than in printing from stone or zinc, as the ink lies in the furrows that have been ploughed or bitten into the plate and not on its surface, the process of printing is also much slower In engraving on stone or zinc, the surface is coated with a preparation of gum and lamp-black, and on it the detail is traced with red chalk and afterwards cut in with very fine steel or diamond points so as just to lay bare the surface of the ground without penetrating to any depth, as in copper-plate engraving A little oil having been rubbed over the surface, the gummy composition is washed away and printing-ink applied, the printing is performed almost exactly in the same way as in ordinary lithography, except that the printing-ink is in the first instance spread over the stone or the zinc plate with a dabber instead of a roller

Electrotyping Electrotyping is employed to conserve work engraved on copper, either by depositing a thin surface of steel over an engraved plate, which enables it to be printed from very much oftener without injury, or by producing a duplicate to be employed in its stead in the printing In the latter case, a double process is gone through first, a cast or matrix is produced in relief by the deposition of copper on the surface of the original plate, and then an intaglio of the matrix—which is therefore a duplicate of the original—is formed by depositing copper on the surface of the matrix For details of these processes, see ELECTRO METALLURGY, vol viii p 114 In the Ordnance Survey electrotyping was first employed to obtain duplicates on which to make the corrections and additions necessary to show the growth of railroads and towns since the time of the original survey The alterations are effected more easily when obsolete details are scraped off the electrotype matrix than when they are scooped out of an intaglio, the original plate is also preserved intact [1] Electrotyping is further serviceable in producing the two editions of the general map, one with contour lines, the other with hill shading, already mentioned, as well as editions for geological and other details It is also serviceable in effecting a combination of portions of several plates matrices of the different portions are riveted together to form a single plate, then an intaglio of this plate is taken, on which any details lost at the junction of the matrices are made good by hand The dimensions of a full-sized plate are $38\frac{1}{2}$ by $26\frac{1}{2}$ inches, the weight of a matrix is 18 lb, and of the duplicate 38 lb

Lithography There are two essentially distinct processes of lithography,—one in which the map is wholly drawn by hand on the stone, the other, a much quicker but coarser process, in which it is traced with greasy ink on specially prepared paper, which is then laid face downwards on the stone When lithographs are to be produced by a single printing, all hill features, as well as topographical outlines and names, are drawn with a pen or fine camel hair brush in ink of one colour Double printing is necessary when the hills are drawn in chalk, two stones being required, one for the chalk work, the other for the pen-and ink work, and in chromo lithography a separate stone is required for the work in each colour For full details, see LITHOGRAPHY, vol xiv p 699

Zincography Zincography has of late years largely taken the place of lithography for printing from hand drawn transfers, though not for hand-drawing on the surface of the zinc, as on stone and copper Zinc plates are less costly and bulky than lithographic stones, and are much more conveniently handled thus a plate measuring about 43 by $28\frac{1}{2}$ inches and $\frac{1}{16}$ of an inch thick weighs 60 lb, is easily carried by one man, and costs 16 shillings, a lithographic stone of the same surface is $4\frac{1}{2}$ inches thick, weighs 450 lb, requires four men

[1] In the French and Austrian surveys corrections are made on fresh copper deposited by electricity over the faulty parts, which are scooped out

to lift it, and costs about £7. Prints from transfers to a zinc plate are as satisfactory as prints from transfers to stone, and there is no liability of the plate being fractured in the press, which not unfrequently happens to the stone. The surface of the plate is prepared by scraping it evenly all over with a razor blade in parallel lines, until all irregularities are removed; the plate is then bent so as to present a slightly convex surface, which is ground with pumice stone and water, and smoothed with a piece of steatite, and then given a grained surface with sand. It is flattened by being passed through a press, after which it is ready to receive the transfer. The subsequent procedure depends, as in lithography, on the circumstance that greasy substances do not mix with water and are repelled by gummy substances. The greasy ink lines of the transfer are readily absorbed by the surface of the plate; then a preparation of gum and decoction of gall nuts (to which a little phosphoric acid is added), applied to the entire surface of the plate, serves to etch the blank ground without affecting the lines of the transfer; but it prevents the ink from spreading, and also fills up the pores of the blank parts of the plate with a gummy substance, which repels a greasy ink. Printing ink, therefore, applied as usual with a roller to the entire surface of the plate adheres to the inked lines only and can be readily washed off the blank spaces, and then a print taken will show the inked lines only. The tracing for transfer is drawn on paper thinly coated with starch to prevent the graphic writing ink from soaking into it; the ink is a mixture of Paris black, Castile soap, white wax, tallow or sweet oil, and shellac, which being greasy is readily absorbed by the zinc. The tracing is laid face downwards on the plate and passed several times under the pressure of the roller of the printing press. It is then wetted and peeled off, the ink remaining on the zinc. The surface of the plate is again washed with the etching liquid, which removes stains from the blank spaces and renders them more susceptible of being equably wetted with water, and also—after a few drops of turpentine have been added—removes the unabsorbed writing ink and helps to fix the lines. The plate is then ready to be printed from. The printing-ink is composed of lamp black—with a little Prussian blue added—and linseed oil varnish of a thickness depending on the temperature and the subject. Small corrections on the plate can be made by removing the surface with a strong solution of hydrate of potash, and then preparing a new surface to be drawn on by applying dilute nitric acid and afterwards washing off the nitrate of zinc.

Anastatic printing. Anastatic printing produces facsimiles of any inked print by transfer to a zinc plate, the inked lines on it being absorbed in a greater or less degree by the plate. The print is laid face downwards on blotting paper, and brushed with a solution of nitric acid diluted with five times its bulk of water until thoroughly and evenly saturated; it is then placed face downwards on a zinc plate with a well grained surface, and passed under the roller of a powerful copper-plate printing press. The grease of the ink, being set free by the acid, adheres to the surface of the plate, but, as the amount of ink absorbed is much less than in the case of an ordinary transfer, it is strengthened by working up with lithographic ink, oil, and gum water until the surface is sufficiently strong to bear etching with the usual preparation of gum, nut galls, and phosphoric acid. The plate is now ready to be printed from in the usual manner. If the original print is an old one, it must first have its ink softened by immersion in hot water containing half an ounce of caustic strontia for every pint of water, the time of immersion varying, with the condition of the print, from a few minutes to an hour. A print well worked up is often superior to the original.

Photography. Photography having already been described in detail (see vol. xviii. p. 821), its application to mapping and map printing need only be noticed here. The action of light can be employed either by placing the map in contact with a sheet of sensitized paper and against a glass plate in a printing frame, when the light will pass through the map and produce a picture of it on the paper, or by using a camera furnished with an object glass, through which rays of light from the map are transmitted so as to produce a picture on a sensitized glass plate, which can afterwards be printed from. The best known of the processes in which the camera is not used is the "cyanotype"; the paper is sensitized with a mixture containing nearly equal proportions of solutions of ammonio citrate of iron and the ferrid cyanide of potassium; the prints give white lines on a dark blue ground, and are very inexpensive. There are other processes of printing with the salts of iron, uranium, &c., which give an exact transcript of the original drawing with dark lines on a white ground. But they are only suitable for maps drawn in pen and ink not larger than the glass plate of the printing frame, being therefore only serviceable in special cases when few copies are wanted; they are little employed and may be regarded more as curiosities than as ordinary methods of map printing. Photography is generally effected with the aid of a camera, and employed to obtain a negative of a map on glass, from which prints may be taken either for use *per se* or for transfer to a flat surface of zinc, stone, or other suitable material to print from. The map is usually attached to a board suspended vertically in an adjustable frame, while the camera is placed on an adjustable stand set at right angles to the map frame on a tramway, along which it can be moved to any desired distance from the map. The camera is furnished with a ground glass focusing screen, on which is pencilled a rectangle whose dimensions are proportional to those of a corresponding rectangle on the map, in the ratio of the scale of the required photograph to that of the map. The map and the focusing screen are brought into parallelism at such a distance that the image of the rectangle on the map exactly coincides with the rectangle on the focusing screen. A sensitized collodion plate is then substituted for the screen and a negative taken, which is afterwards "fixed" and "intensified" so as to produce the greatest transparence in the lines and an almost opaque density of the ground. Printing from a negative is usually performed by the action of light when only a few copies are wanted, and mechanically when many are wanted; the prints are taken directly from the negative in the one instance, and from a transfer of the negative to the surface of a stone or metal plate in the other. Of the processes of printing directly from the negative, silver printing, the oldest, is as yet unsurpassed for the delicacy of its results, but it is expensive and perishable; the prints are taken on paper coated with albumen containing an alkaline chloride, such as common salt, floated on a bath of nitrate of silver, and allowed to dry in the dark. After exposure to light in a printing frame, the prints are washed, toned with a solution of gold, and then fixed in a bath of hyposulphate of soda, which dissolves all the remaining unaltered chloride of silver. At the Ordnance Survey office platinum printing is now (1887) largely used instead of silver printing for all purposes where only a few copies of a map are required. It is more expensive, but the prints are absolutely permanent and are produced more quickly than silver prints. Their rich velvety black colour and freedom from glaze render them peculiarly suitable. The paper is sensitized with a preparation of platinum and ferric oxalate. After exposure to light, the image is developed almost instantaneously by laying the print on a hot solution of potassic oxalate; it is then washed in successive baths of dilute acid to remove the soluble iron salts, and after that in a few changes of water. Various processes of "collo chromate" printing are also most usefully employed in map-printing; they depend on the reaction of the salts of chromium—particularly the alkaline bichromates—on gelatin, gum, albumen, or other colloid substances, which, in proportion to the amount of the action of light upon them, become more or less insoluble in and unabsorbent of water, and acquire the property of taking up greasy ink and not attracting plumbago or other fine dry pigment in powder. When the subject is in line the print is taken on paper that is usually coated with a mixture of gelatin and bichromate of potash, coloured with Indian ink or any other suitable pigment; after a few minutes' exposure in the copying frame the paper is plunged into tepid water, which dissolves the unaltered gelatin in the blank parts of the print—they have been protected from the light under the dark parts of the negative—leaving a clear image in pigment on a white ground. When the subject is in half tone, the gelatin film has to be detached from the paper that it may be developed by being washed on the unexposed side, a temporary support being employed to preserve the image from injury during the washing; the most delicate shades in the half tones are thus perfectly preserved.

Photo-mechanical printing. In the processes noticed above it is necessary to repeat the operation by exposure to light for every print produced; the rate of printing will therefore be more or less dependent on the sensitiveness of the paper, the strength of the light, and the condition of the atmosphere. In the processes about to be described these disadvantages are obviated by transferring the photographic image to a surface of stone or metal, from which prints may be made mechanically in any numbers independently of light or weather. The photo-mechanical processes are broadly divisible into two classes,—one comprising photo-lithography, photo-zincography, and photo-typography, for the reproduction of subjects in line only; the other, photo-collotype and photo-gravure, for subjects in mezzo-tint or half-tone as well as line.

Photo-lithography and photo-zincography. Photo-lithography and the analogous photo-zincography are the processes which have hitherto been most extensively employed for map printing. They are the simplest to carry out; they allow the photographs of several sections of a map which may be too large to be reproduced as a whole to be combined; and additions and corrections may be readily made by hand on the stone or zinc plate. The prints for transfer from the negatives are taken on paper coated with a mixture of gelatin and potassium bichromate, as in the pigment printing process, except that the greasy ink or colouring matter is not mixed with the gelatin, but applied evenly over the surface of the prints after exposure to the light. The inked print is immersed for a few minutes in tepid water to soften the gelatin still remaining soluble in the parts not acted upon by light, and is then laid on a sloping plate and washed with a soft sponge until all the unaltered soluble gelatin and the ink overlying it are removed. The lines on which the light has acted remain insoluble and retain the ink, forming a clear image of the subject in a greasy

ink. When a map is photographed in several sections, as often happens, each section overlaps well all round to enable the transfers from the different negatives to be neatly joined together without showing lines of junction; if the whole is too large to be printed on a single sheet of paper, it is cut up into sections for printing separately.

Photo-typography. The object of photo-typography is to obtain by photographic agency a surface block which may be set up with type and printed in the same way as a woodcut. The image may be obtained on a zinc plate by transfer in the same way as for photo-zincography, or it may be printed directly from a reversed negative. In the latter case the zinc plate is usually prepared with a thin coating of bitumen, a substance which has the property of becoming insoluble under the influence of light, so that, when after exposure the plate is washed with turpentine or benzole, the image remains on the zinc, while the ground is washed away. In both cases the image is strengthened by careful inking and by the application of powdered resin, which the plate is heated sufficiently to melt. The image is then etched with nitric acid. The operations of inking, applying resin, and biting with acid are repeated several times, until the plate is bitten sufficiently deeply to give clear prints. In another process, which is perhaps preferable for fine work, a mould is obtained by electrotyping a relief in swollen gelatin, the surface of which has been metallized with plumbago or bronze powder. These processes are largely used for producing small maps to illustrate books and newspapers, but not for maps of ordinary size.

The three mechanical processes just noticed are only applicable to maps drawn in line, and to get good prints every line should be of the same blackness, though of different breadth. Attempts have been made to reproduce brush-shaded drawings, exhibiting continuous gradations of shade, by photo-lithography and photo-zincography, but with very partial success, and only by breaking up and destroying the continuity of gradation. The following processes are specially suited for reproducing maps in half-tone.

Photo-collotype. In photo-collotype, so called from the printing surface being of gelatin, a plate with a perfectly smooth surface, usually of thick glass, either is coated with a sensitive mixture of gelatin and bichromate of potash, upon which the photographic image is produced by the action of light through a *reversed* negative, or is employed to support a gelatin film on which the image has been imprinted from an ordinary negative, and which is attached to the plate with suitable cement. The gelatin when properly moistened possesses the valuable property of receiving a greater or less amount of ink in different parts of the image in exact proportion to the intensity of the action of the light on each part; thus it is capable of reproducing the most delicate gradations of shade. The process is admirable for maps of small size, which only require a single plate, but is not suited for making a combination of sections to form a map of ordinary size; nor can additions or corrections be made on the gelatin film, which is, moreover, so tender that it does not readily permit of a large number of prints of uniform quality being taken, and is easily damaged.

Photo-gravure. The several methods of obtaining an incised image on a copper plate by means of photography are broadly divisible into the two groups of electrotyping and etching processes, one of each will be briefly noticed. (1) A positive pigment print, forming a relief in hardened gelatin, is developed on a silvered copper plate by the ordinary operations of the autotype or pigment printing process; it is then blackleaded and copper is deposited on it to form an electrotype intaglio, from which prints may be taken in the usual way, three to four weeks being required for the deposition of enough copper to produce a plate of sufficient thickness. (2) A negative pigment print is developed on a highly polished copper plate, upon which a very fine grain of powdered resin has been deposited and fixed by heat. The intaglio is obtained directly on the plate by biting in with a solution of perchloride of iron, which penetrates the gelatin film with comparative ease in those parts representing the shades and lines of a map, where there is little or no gelatin, and thus bites the copper to a considerable depth, while in the parts representing the blank spaces and ground of the map, where the gelatin is thicker, it penetrates with more and more difficulty as the thickness of the gelatin increases, and in the highest blanks should leave the copper untouched. The operation of biting takes only a few minutes, and the gravure is remarkable for its delicacy of gradation and richness of effect; there is, however, some difficulty in etching to the proper depth so that the plate may stand much printing without the loss of the finest tint. In both cases the copper plates have to be protected by a facing of steel before they can be printed from. The processes have not yet been used to any great extent for maps with half-tones, but they are very promising. For maps in line the first method gives excellent results, and is largely employed in the Austrian and Italian surveys.

X. INSTRUMENTS

The instruments employed in survey operations are broadly divisible into two classes, one for making the requisite linear and angular measurements on the ground, the other for plotting the data thus acquired on paper, and for measuring from the map, when completed, lengths and areas which it may not be convenient to calculate from the numerical data. As a rule different instruments are employed for the mensuration on the ground and for the plotting on paper; but to this rule there is a notable exception in the plane table, by means of which all bearings may be drawn directly on paper with a sight rule, without previous measurement of any kind, and thus a plot of the ground may be constructed without employing any other instrument.

Field Instruments. *Field Instruments.*—These are of two classes,—linear, for determining distances directly by actual measurement along the surface of the ground, and angular, for determining the bearings of, or the angles between any objects. Some instruments are automatic, as the needle, which points to the magnetic north, the plumb-line and the spirit-level, which indicate the direction of gravity, and hypsometers of various kinds, for measuring altitudes; others are entirely controlled by the manipulator. Some require to be rigidly supported on the ground, as measuring bars and theodolites; others are adapted for flexible supports, as reflecting and magnetic instruments, which may be employed either on land or on the oscillating deck of a ship at sea. Some, as magnetic compasses, measure angles in the horizontal plane only; others, as theodolites, in two planes,—one horizontal, the other vertical; others, as reflecting instruments, in all planes; others, as levelling instruments, measure nothing, but simply indicate a plane of reference. And there are certain instruments by which angles are measured in the ordinary way, and direct distances are determined by micrometric measures of the small angles subtended at a distance by objects of known dimensions.

Linear instruments. Linear instruments are of two classes,—one for exact measurement of base-lines the lengths of which are required to be known with great precision, the other for ordinary and rough measurements. Among the former may be included the Colby apparatus of compensation bars and microscopes, described in sect. I, § 2 (p. 696 above), Bessel's apparatus, those of Struve and the United States Coast Survey, and Porro's (adopted by the Spaniards and the French in Algeria), which have already been described in EARTH (FIGURE OF THE), vol. viii. pp. 598, 600, and GEODESY, vol. x. pp. 163, 164. For less exact but still essentially accurate measures the instruments most commonly employed are the brass or steel chain of 100 links, the graduated metallic tape, and the offset pole.

For reconnaissance and rough measurement, perambulators, with wheels of known periphery and dials to indicate the number of revolutions, are largely used in India. Crinoline wire has been employed with advantage in Australia; it is so light that a length of 1000 feet or more may be easily carried, rolled on a drum, by one man, who pays it out as wanted; he is usually followed by another, who commences rolling it up at the opposite end when an entire length has been laid out on the ground. Air lines are sometimes measured by stretching the wire over the tops of trees in valleys obstructed with forest, also the breadths of rivers by resting the wire on logs anchored at suitable intervals to support it above water.

Angle-measuring instruments. Angle-measuring instruments are of two classes, direct and reflecting. Both are provided with an aligner, usually a telescope, which is pivoted over the centre of the graduated circle or sector; in one the aligner is pointed in succession to any two objects the angle between which is being measured; in the other it is pointed to one object, while an image of the second is thrown on the first by double reflexion from a pair of mirrors. Reflecting instruments are largely employed in nautical surveys, as they can be held by the hand and do not require a rigid support; but they are very rarely used in land surveys. A description of them will be found under SEXTANT (vol. xxi. pp. 724-725). They give the angle in the plane in which they are held; and, whenever this plane is sensibly oblique to the horizon, the angle must be reduced by calculation to the plane of the horizon before it can be employed in the work of a land survey. The other instruments give the required horizontal angles, whatever the altitudes of the objects observed.

The circles of angle-measuring instruments are usually divided into 360 equal parts called degrees, and subdivided into spaces ranging downwards from thirty to five minutes of arc, according as the diameter of the circle is increased. Smaller arcs are measured by interpolation between the subdivisions, with the aid of a circle reader which moves with the aligner. All instruments except those of the simplest form are supplied with one or more circle readers and spirit-levels and a telescope; these important adjuncts, which are common to so many instruments, will therefore be first described, and afterwards the more important instruments which are employed in connexion with survey operations.

Circle readers are of two kinds,—the vernier and the microscope

Circle readers. Both are held over the circle at the extremity of a radial arm pivoted over its centre The vernier moves in contact with the surface of the circle, while the microscope views it a short distance off, the former is usually applied to circles whose diameters do not exceed 12 inches, the latter to those of larger diameter Both kinds of reader are applicable to linear scales as well as to graduated circles, the microscope being usually employed when most precision is desired

Vernier. The vernier is so called after its inventor, a Frenchman Its principle is very simple The space between any convenient number, n, of graduations on the circle is set off on the vernier and divided into $(n+1)$ equal parts, then some one division of the vernier will always coincide with a graduation of the circle On counting the divisions from the index onwards it is found that the coinciding division, say the mth, of the vernier is opposite the mth graduation of the circle, counting from the last one passed by the index This indicates that the distance of the index from the last graduation is $\frac{m}{n+1}$ parts of the space between the graduations, n is invariably taken as an odd number, such that the unit of $(n+1)$ may be some convenient aliquot part of the circle, as a minute for a circle divided into degree spaces

Micrometer microscope. The micrometer microscope presents the combination of object and eye glasses met with in ordinary microscopes, with the addition of a wire carrying diaphragm, movable by a screw, for micrometric measurements in the plane of the focus of the object glass The tube is conical at the object end and cylindrical at the eye end, the box of the micrometer is mounted between these two parts at right angles with the visual axis The tube is held at the extremity of the arm of an alidade, in a collar in which it may be moved closer to or away from the surface of the circle, or be turned round so as to place the micrometer tangentially to the circle The distance between the micrometer and the object glass is usually about four times that between the object glass and the face of the circle, and thus a correspondingly magnified image of the spaces between the graduations is obtained in the plane of measurement The object glass is held in a small tube which can be screwed in or out of the principal tube, to enable the length of the image to be adjusted to an exact integral number of revolutions of the micrometer The box of the micrometer and the wire diaphragm are rectangular, the latter sliding to the right or left within the former Slow motion is communicated to the diaphragm by the micrometer screw, which passes into it through a collar in one side of the box, against which the shoulder of the screw is pressed by an internal spiral spring acting against the sides of the diaphragm and the box The screw is furnished with a circular head divided into a number of equal parts—usually 60, each equivalent to 1″ for circular arcs, and 100 for linear scales—and is rotated opposite an index arm fixed on the box, complete revolutions are marked by the teeth of a stationary comb, which is fixed above the wire of the diaphragm and viewed with it through the eye piece

Spirit level. The spirit-level consists of a glass tube not quite filled with alcohol, a small quantity of air being left, which rises as a bubble to the highest part of the tube In small and coarse levels the diameter of the tube is largest in the middle and decreases uniformly towards the ends, which are closed by the blow pipe, in long and delicate levels the tube is cylindrical, but with a longitudinal portion of the interior surface ground to the curvature of a circle of greater or less radius according as the level is designed to be more or less sensitive, and it is sometimes closed by circular glass stoppers cemented into the ends When the tube is held horizontally, with the curved surface of the interior uppermost, the middle part is occupied by the air bubble Lines are etched on the outer surface at equal distances from the central point, to enable the tube to be set with the bubble exactly in the middle, or a scale graduated throughout its entire length is provided, to enable any deviation from centricality to be measured and the corresponding dislevelment to be calculated and allowed for subsequently in the reduction of the observations The glass tube is commonly fixed in a metal tube, with plaster of Paris for protection, but, as it is then liable, under changes of temperature, to torsion and strain, which may sensibly alter its curvature, it is preferable to place it in a metallic cradle and rest it on cork bearings, with due provision against sliding, the whole being covered with a glass cylinder if need be for further protection. The metallic cradle or tube is attached to any instrument on which the level is to be mounted by adjusting screws, for setting it correctly with reference to the axis of rotation with which it is associated The value of a division of the scale, in seconds of arc, is usually called the "run," and is determined by attaching the level with its scale to a (generally) vertical circle, and taking both the circle and the bubble end readings in different positions of the circle As the length of the bubble is much affected by changes of temperature, and the curvature of the tube may not be identical at all points, values of the run are commonly obtained under widely differing temperatures

Telescope. The telescope consists of a tube, carrying an achromatic object-glass and an eye piece which holds either a pair of lenses for viewing the inverted image transmitted by the object glass or a combination of four lenses for inverting the image and causing all objects to be viewed naturally The former is usually employed for observing celestial objects, the latter for observing terrestrial The field of view being more or less extensive, a central point is established in the tube, usually by the intersection of a pair of fine wires or spider lines—one vertical, the other horizontal—in the plane of the image, and the telescope is directed by bringing this point on any specific object in the field As the interval between the object glass and the image varies with the distance of the object, a tube is provided to slide within the telescope tube and carry the object-glass at one end, while the telescope tube carries the diaphragm and eye piece at the other end, or *vice versa* The image and the wires are brought into the same plane by a focusing screw, which acts on the inner through the outer tube The wires are attached to the surface of an adjustable annular diaphragm, which is held in position by two pairs of antagonizing screws—one pair horizontal, the other vertical—with shoulders working against the exterior of the tube in which the diaphragm is contained, so as to move it to the right or left and up or down, in order to bring the point of intersection of the wires into the visual axis of the telescope In practice the first adjustment is to set the eye piece to distinct vision of the wires, the object glass is then set truly to focus, which is accomplished when no apparent parallax, or movement of the image relatively to the wires, is seen on shifting the position of the eye, for this would indicate that the image is either in front of or behind the plane of the wires The line joining the point of intersection of the wires with the centre of the object glass is called the "line of collimation," and the diaphragm should be so fixed that this line may always be perpendicular to the axis on which the telescope revolves

Surveying compass. The surveying compass gives the magnetic bearing of any object, and is the simplest of all instruments for measuring horizontal angles It consists of a magnetized needle, with an agate centre, poised on the point of an upright pivot in the centre of the bottom of a circular box and carrying a concentric circular card or silver ring, the circumference of which is graduated into 360°, and is sometimes further subdivided The aligner is constituted by a pair of sight vanes attached to the box at opposite extremities of a diameter, one vane having a narrow slit for the eye to look through, the other with a wider opening bisected by a vertical wire to be set on the observed object There is no circle reader, the prolongation of the wire on to the graduations being estimated by the eye, and there is no level, for the circle poises itself horizontally on the supporting pivot

Prismatic compass. The prismatic compass is similar to the surveying compass, with the addition of a prism in the eye vane through which the wire of the sight vane and the divisions of the circle are viewed apparently together, the division with which the wire coincides when the needle is at rest indicates the magnetic azimuth of any object bisected by the wire The sight vane carries a mirror turning on a hinge, to enable objects to be seen by reflexion which may be too high to be seen on the wire, the eye vane is furnished with a pair of dark glasses to be employed when the sun is being observed

Magnetic instruments are useful for rapid reconnaissance and rough survey, and for filling in the minor details of an exact survey, but they are not to be relied on to give bearings with errors less than ten to fifteen minutes In plotting, however, bearings are preferable to angles, for, by drawing a number of meridional lines parallel to each other on the paper, each bearing may be plotted from an independent meridian without any accumulation of error, such as arises when a number of angles are plotted in succession with the protractor adjusted on short lines

Plane table. The plane table is in its usual form simply a rectangular board mounted horizontally on a stand, on which it may be turned round and set in any required position, it is furnished with a flat sight rule, which usually carries a pair of sight vanes and has a bevelled edge, parallel to the line of sight, to serve as a ruler, also with a magnetic needle Occasionally the construction is more elaborate, and the board is surrounded by a marginal frame with graduations radiating from the centre as the degrees of a circle, so that it may be used as an instrument for measuring horizontal angles, while the sight rule is furnished with a telescope, which takes the place of the vanes and is mounted on an axle to measure vertical angles The size is made as great as is consistent with the limits of portability in each instance, so that the sheet of paper to be drawn on may be as large as possible The standard plane table of the Indian Survey measures 30 inches by 24, and is made of planks of well seasoned wood 1 inch thick, with transverse edge bars below to prevent warping and buckling It is set up on a stand, usually a braced tripod, to which it is clamped by a powerful hand screw passing through the head of the stand into a brass socket fixed centrally under the table; the screw when relaxed serves as a pivot, round which the table may be turned in azimuth and set in any required position The table is then firmly clamped so as to maintain a constant position during all the subsequent laying off of bearings The sight rule is 30 inches long, 2 wide, and one-

thud of an inch thick, of ebony, with a biass sight vane at each end, and a fiducial edge paiallel to the line of sight, the vanes aie about 5 inches high, which gives sufficient elevation and depiession foi general use The magnetic needle is about 6 inches long and is held in a iectangulai brass box an inch bioad, placed on the table whilst it is being set and afterwards iemoved Heights may be deteimined on the spot with the aid of a clinometer, foimed of a bar cairying a spirit-level and a pair of sights, one of which has a scale of tangents giaduated to radius = the interval between the sights For the method of employing the table see § 4, p 709 above

Theodolite

The theodolite, the most impoitant of all instiuments foi the puiposes of a suivey, is a combination of two giaduated cncles placed at iight angles to each other, foi the measuiement of hoii zontal and vertical angles, a telescope, which tuins on axes mounted centiically to the cncles, and an alidade foi each circle, which caiiies two oi more ieaders of the aics thiough which the telescope is moved The whole is supported by a pedestal iesting on foot sciews, which aie also employed to level the instiument The size varies fiom a minimum with cncles 3 inches in diametei to a maxi mum with a 36 inch hoiizontal and an 18 inch veitical cncle, the weight ianging fiom 4 lb to 1000 lb, the dimensions and magni-fying poweis of the telescope increase with the diameter of the hoiizontal cncle The telescope may be connected rigidly with the alidade and move with it while the circle iemains stationaiy, oi with the cncle and move with it while the alidade iemains stationaiy The vaiieties of foim as well as of size aie numeious in some the telescope may be completely tuined round in altitude as well as azimuth, and pointed to any object celestial or teiiestiial, in otheis the iange of movement in altitude is iestiicted to about 25° above and 25° below the hoiizon, and a paii of sectois are substituted for the complete vertical cncle, in some the telescope and veitical cncle aie placed between, in otheis outside of, the pillars which suppoit then common axis, in some the pedestal is a simple tiibiach resting on thiee foot sciews, in otheis it takes the objectionable foim of a ball cairying the vertical axis and a socket holding the ball between two paiallel plates, which aie antagonized and set fiim by two paiis of foot screws, turning in sockets fixed to the lowei plate, while their heads aie piessed against the upper plate, to fix it and bring the instrument into level at the same time There are numeious other specialties of foim which have been intioduced to meet specific iequiiements, but these cannot be noticed heie

Transit theodolite

The tiansit theodolite is an alt-azimuth instiument with the giaduated cncles of equal diameter, usually 6 to 8 inches The telescope is mounted between a pair of conical aims which tapei outwaids and end in cylindrical pivots, constituting what is called the tiansit axis of the instiument The pivots iest on Y's oi in semicnculai collais, on the heads of a pair of pillais, which aie made of sufficient height to enable the telescope to revolve between them and be pointed to stars in the zenith These pillais stand on a cnculai plate, which seives as the alidade of the hoiizontal cncle and is usually constiucted to ievolve round a vertical axis fixed in the centie of the plate of the hoiizontal cncle, this axis passes downwards into a socket in the centie of a tribrach, which foims the pedestal of the instiument and rests on three mill headed foot-sciews by which the instrument is levelled The veitical cncle is mounted centrically on one of the cones of the tiansit axis, neai the pivot end, its alidade, usually a rectangulai plate carrying a pair of veiniers, is fitted centiically ovei that axis, in contact with the cncle but nearer the shoulder of the pivot, and, while the telescope and the cncle revolve together, it is held station-ary by an adjustable arm the end of which is pinched between a pair of antagonizing sciews mounted on the nearest pillar The alidade of the hoiizontal circle caiiies two oi three equidistant veiniers, because any eiioi in centiing an alidade ovei a cncle is eliminated in the mean of the ieadings whenever two or moie verniers, placed at equal distances apart iound the circle, are read A clamp, with a tangent sciew foi communicating slow motion, is attached to the neaiest pillai, to act on the veitical circle and the telescope, another is attached to the plate of the hoiizontal cncle, to act on the alidade of that circle and so also on the telescope foi azimuthal motion, and a third to the pedestal, to act on the plate of the hoiizontal circle The fiist two aie employed in measuiing the vertical and azimuthal angles, the thiid in setting the zero-diameter of the hoiizontal cncle in any specific direction, with a view to the repetition of the mea-surements of the azimuthal angles at diffeient parts of the cncle Foi levelling the instiument, two levels aie fixed at right angles to each other on the plate of the alidade of the horizontal cncle, a third is attached to the telescope, oi, piefcrably, to the alidade of the veitical cncle, a fouith is mounted on the transit axis when levelling for astionomical observations A magnetic compass oi needle is added, and also a plummet for centiing the instiument over the station mark

Theodolites aie designed to measure hoiizontal angles with greater accuracy than veitical, because it is on the former that the most impoitant woik of a survey depends, and they are measurable with gieatest accuracy, measures of vertical angles are liable to be much impaired by vaiiations in the iefractive condition of the lowei strata of the atmosphere, moie paiticulaily on long lines, so that when heights have to be deteimined with much accuiacy the theo dolite must be discaided foi a levelling instiument, to be set up repeatedly with staves at shoit distances When tiuly adjusted the theodolite measuies the hoiizontal angle between any two objects, howevei much they may diffei in altitude, as the pole stai and any teiiestiial object, but, as adjustments aie not always made with accuiacy noi permanently maintained, it is desiiable always to take the obseivations in paiis, with the face of the vertical cncle alteinately to the iight and left of the obseivei, foi this eliminates collimation eiroi from the hoiizontal angles and index eiioi in the setting of the spirit-level fiom the vertical angles

When a hoiizontal angle is measuied seveial times foi greater accuiacy, one of two methods of proceduie is adopted (1) The angle is measured once oi oftenei in the usual way, the hoiizontal cncle remaining clamped and the telescope and alidade moving over it, then the position of the hoiizontal cncle is shifted [1] as often as may be desiied, and after each shifting the angle is again measured as foimeily, thus a separate numeiical result is obtained foi each operation Oi (2), the first object A having been obseived and the telescope set on the second object B, the hoiizontal cncle is unclamped and tuined round until the telescope is brought back on A, when it is again clamped, then the alidade is unclamped and the telescope again moved over the hoiizontal cncle to be set on B The operation is iepeated as often as may be desiied The veinier ieadings are only taken foi the fiist telescope pointing to A and the last to B, their diffeience + 360° foi eveiy complete revolution of the cncle, divided by the number of repetitions, gives the angle This method is objectionable when a iound of several angles has to be measured, but it enables the value of a single angle—moie par ticularly a small one, as between objects in the same field of the telescope—to be determined accurately with much gieater iapidity than the fiist method

An auxiliaiy telescope is sometimes fixed below the plate of the horizontal cncle of a theodolite, to be pointed to a refeiiing maik while the uppei telescope is being moved about, and thus to seive as a check on the geneial stability of the instrument and on the per-manence of the initial setting of the circle duiing the measuiement of a iound of angles When a theodolite is set up on a lofty scaffolding which is liable to be swayed by the wind, oi on a stand which cannot be ieadily isolated from the obseiver, hoiizontal angles may be measuied accuiately by employing a second observei to keep the auxiliaiy telescope tiuly pointed to a refeiiing maik while the obseiving telescope is being pointed

Subtense transit theodolite

The subtense tiansit theodolite diffeis from the oidinaiy tiansit theodolite meiely in having a pair of wire caiiying micrometeis mounted in the telescope tube, in oidei that the small angle sub tended by a distant object of known dimensions, or by two objects sufficiently near each othei to be seen in the same field of the tele scope, may be measuied with gieatei facility and piecision than on the graduated cncles in the usual way The micrometeis aie held in a iectangular box, one on the right hand, the other on the left, with the wiies biought as closely as possible into the plane of the fixed wires in the oidinaiy diaphragm, the box can be tuined on the telescope tube thiough an angle of rather moie than 90°, to enable the micrometei wires to be set parallel to either the hoii zontal oi the vertical wiie of the diaphragm, or to be placed at any desiied angle of inclination The subtense object usually employed in suivey work is a pole of known length, if held peipendiculaily to the line of sight of the telescope, its direct distance may be deteimined fiom the angle measuied by the micrometers with a sufficiently small peicentage of eiroi to make this method piefeiable to chaining ovei iough giound The instiument has been advan tageously employed in caiiying tiaverses of consideiable length over ground which was impracticable for diiect lineai measurements The micrometeis aie also seiviceable in astionomical obseivations foi time and longitude, foi they give additional wires on which to obseive the passage of a stai, at distances fiom the fixed wire which may be vaiied with the speed of the star, and foi determining the longitude they peimit numerous measuies of the distance between the edge of the moon and a star to be taken, immediately befoie and after occultation

Eckhold's omnimeter

Eckhold's omnimeter is a theodolite fuinished with a micioscope of consideiable magnitude facing a graduated linear scale, the tube of the microscope is rigidly attached to the telescope tube, eithei at right angles oi parallel to it, so that the two always move to gether The scale is fixed either parallel or peipendicular to the alidade plate of the horizontal cncle, thus, when the telescope is moved thiough vertical arcs within the range of the scale, the tangents of the arcs are measuied by the microscope on the scale The latest and best foim of the instrument is shown in fig 8, which represents a tiansit theodolite converted into an omnimeter by the application of a micioscope AB to the telescope at right

[1] This is often done arbitrarily, but systematic shifts which bring equidis tant graduations of the circle under the verniers during all the telescope point ings to any one object are always preferable (see sect I, § 9, p 698 above)

angles to it, and of a scale C to the plate of the alidade of the horizontal circle in a plane parallel to that of the vertical circle. The microscope is furnished with a diagonal eye-piece, through which the observer looks down on the scale. The scale is divided into 100 equal parts, and is movable in its bed-plate through the length of one of these divisions by one rotation of a micrometer screw, with a large head, D, the circumference of which is divided into 100 equal parts, each divisible into fifths by a vernier. The microscope has a fixed wire in a diaphragm at its eye end, A, and, when the telescope is set on an object and the wire is seen between a pair of divisions on the scale, the scale is moved by the micrometer screw until the nearest division is brought under the wire; the scale reading corresponding to the horizontal position of the telescope being known, the difference between it and the reading when the telescope is pointing above or below the horizontal plane is the tangent of the arc of elevation or depression, to radius = the perpendicular from the axis of rotation of the telescope to the scale. Thus both the distance and the height of any point over which a staff of known length has been set up vertically may be readily determined with fair accuracy. Let O (fig. 9) be the position of the transit axis of the telescope, OA the direction of the telescope when horizontal, and Oa the corresponding direction of the microscope at right angles to the scale amn; let M be a distant point over which the staff MN has been set up vertically, and let m and n be the graduations under the microscope when the telescope is pointing to the bottom and top of the staff; then, since MN and Oa are known, the horizontal distance OA and the height AM are determined from the proportions

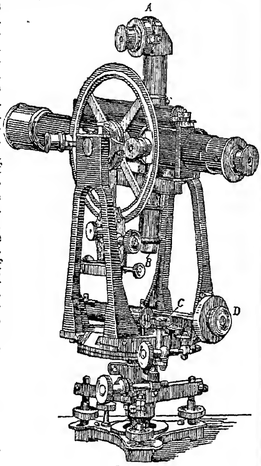

Fig. 8.

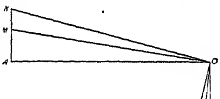

Fig. 9.

$$\left.\begin{array}{l} OA : Oa \\ AM : am \end{array}\right\} :: MN : mn.$$

It is essential that the focusing tube of the microscope should always move parallel to the visual axis when different divisions of the scale are being brought into focus, otherwise errors materially exceeding the quantities appreciable by the micrometer may be caused. The linear results thus obtained are satisfactory when the subtense staff is set up at a moderate distance; the instrument has often been used with advantage in localities where measuring chains could not be conveniently employed. As an angular instrument it is identical with the ordinary transit theodolite, as will be seen from the figure, which may be referred to as illustrating the description of that instrument; the foot-screws are represented as resting on a plate such as is usually fixed on the head of a folding tripod stand, their lower extremities, as well as the grooves in which they are placed on the plate, being concealed from view by a capping upper plate, which is clamped over their shoulders to prevent the instrument from falling off the stand.

Prismatic reflexion theodolites.

In any theodolite with a telescope of the ordinary form the height of the pillars must necessarily be somewhat greater than half the length of the telescope if stars in the zenith are to be observed or if the telescope is to be completely rotated on its transit axis; the higher the pillars the higher the centre of gravity, the less perfect the stability of the instrument when set up for observation, and the greater its weight and cumbersomeness for transport. In Germany and Russia theodolites and transit instruments are sometimes employed in which the eye end of the telescope tube is removed—a counterpoise to the object end being substituted in its place; and a prism is inserted at the intersection of the visual axis with the transit axis, so that the rays of light from the object-glass may be reflected through one of the tubes of the transit axis to an eye-piece in the pivot of this tube. In this case the pillars need only be high enough for the counterpoise to pass freely over the plate of the horizontal circle; but the observer has always to place himself at right angles to the direction of the object he is observing.

Levelling instrument.

The levelling instrument consists of a telescope which carries a long spirit-level parallel to itself and is mounted on a horizontal plate, which is fixed rigidly either on the head of a vertical axis revolving within a socket in the centre of the pedestal or on that of a hollow cone revolving round a vertical axis which projects upwards from the pedestal. There are various forms of the instrument; in the Y-level the telescope rests on a pair of Y's, in which it can be both rotated and turned end for end; in the dumpy level the telescope is rigidly attached to its supports, and its tube is made shorter and of greater diameter, to carry an object-glass of shorter focal length and larger aperture. A magnetic compass is attached to the instrument to enable the bearings of the levelling staves to be taken whenever desired. Levelling staves are of a variety of patterns and are graduated in various ways, best on both faces and dissimilarly, for a check on accidental errors of reading, as indicated in sect. III.

Reflecting levels.

Reflecting levels are portable instruments which may be held by the hand for rough and rapid survey work. They are of two forms: in one an image of the eye of the observer, in the other an image of the bubble of a spirit-level, is seen by reflexion on a level with the observed object. The first consists of a square of common looking-glass, which is set in a frame suspended from a ring on the line of prolongation of one of the diagonals in such a manner as to swing freely but not turn round on its axis of suspension; the frame is weighted by a metal plate behind, to which it is so adjusted that, when suspended, the plane of the surface of the mirror will be vertical. A small portion of the glass at one end of the horizontal diagonal is either cut away or unsilvered. When the image of the observer's eye is seen on the diagonal, all objects bisected by the diagonal, whether viewed through the opening in the mirror or by reflexion, are on the level of the eye. The second consists of a tube open at the object end and closed at the eye end by a disk which is perforated with a sight hole; a mirror filling up half the section is fixed in the tube, facing the eye end at an angle of 45° with the axis; and an all-round transparent spirit-level is mounted over an opening above the mirror, and its bubble is seen by reflexion in the axis of the tube. Abney's level is of the latter construction, but with the spirit-level attached to the alidade of a graduated arc fixed to one side of the (rectangular) tube; thus vertical angles as well as levels may be determined with it.

Abney's level.

Optical square.

The optical square is a reflecting instrument indicating a right angle, and is of great use in laying off perpendiculars for the measurement of offsets from a line of survey. It consists of two glass plates, one wholly the other partially silvered, which are fixed permanently in a shallow circular box at an angle of 45°, so that any two objects seen together through a sight hole in the box—one directly through the transparent portion, the other by reflexion in the mirror of the partially silvered glass plate—subtend an angle of 90° at the point where the observer is standing.

Plotting instruments.

Plotting and Plot-measuring Instruments.—These comprise linear scales, common compasses, and angular protractors for laying off distances and angles measured on the ground, proportional compasses and pantagraphs for reproducing a finished plot on some other scale, and opisometers and planimeters for measuring plotted lines and areas.

Scales.

Scales are divided, either decimally or fractionally, into equal parts, each of which is a portion of a fixed unit of length, as a foot or an inch; some are subdivided more or less minutely throughout their entire length between a pair of parallel lines; others are subdivided at their extremities only. Diagonal scales are formed by eleven equidistant parallel lines, the outer ones of which are divided primarily and subdivided into tenths at their extremities. The primary divisions are joined by cross lines perpendicular to the eleven parallel lines; the end subdivisions are joined diagonally, the first on the lower line with the second on the upper, and so on, each diagonal cutting every horizontal line in a point a tenth of a subdivision beyond the cutting point on the parallel line below, as measured from any one of the perpendicular lines; and each of these tenths is further divisible into tenths by measuring from the perpendicular at intervals of tenths between the parallel lines; thus great precision of measurement is obtained.

Marquois scale and triangle.

The Marquois scale and triangle consist of a scale divided throughout into equal parts more or less minutely and a right-angled triangle of which the hypothenuse is three times the shortest side. An arrow is drawn perpendicular to the hypothenuse to serve as a pointer to the divisions of the scale. The third side has a bevelled edge for ruling. When the triangle is placed with its hypothenuse against the scale and is moved along it, all lines drawn

along the bevelled edge are parallel to each other, their distances apart being one third of the distances travelled by the arrow along the scale

Compasses Compasses usually take the form of a pair of legs movable about a joint, so that their extremities, which are of steel, finely pointed, may be set at any required distance apart, the legs may be knee-jointed, and one is usually adapted to hold either a pencil, a ruling pen, or a steel pointer, as may be desired A beam compass is employed when long lengths are laid off, it consists of a light tubular metal bar, or a rectangular deal rod, fitted with a pair of boxes, which slide along it and carry either pen, pencil, or pointer, and may be set and clamped at any desired distance apart

Proportional compasses Proportional compasses consist of two parts so exactly similar that when held in contact throughout they appear as one, each is pointed at both ends, flat and grooved through one half its length, and tapering to a point in the other half The two are coupled together by a pair of similar sliders, one for each groove, turning on a common axle which carries a disk at one end and a clamping screw at the other, by shifting the position of the sliders in the grooves the distances between the points at the opposite ends can be brought into any desired proportion The settings for different proportions are effected by bringing a line on the slider opposite the lines of a fractional scale engraved on one side of the groove

Protractors Protractors are of two forms circular (or semicircular) and rectangular, the circumferences of the former are divided into 360° or 180°, the latter are divided on three sides of their periphery by lines drawn from the centre of the fourth side to the degree points on the circumference of a semicircle of which that side is the diameter The protractor being set with its centre on a given point and its zero line on a given line passing through the point, any angle with this line at the point can be readily laid off Protractors for plotting traverses are commonly annular, that they may be centred over the station of origin with the zero diameter on the initial meridian, their bearings at any other station may be laid off without moving the protractor by drawing lines parallel to the same bearings at the origin Rectangular protractors sometimes have parallel lines engraved on their faces at equal distances, for setting over paper ruled with parallel lines at unequal distances, and their backs engraved with scales of rhumbs, sines, secants, and tangents and common scales of equal parts

Station pointer The station pointer enables the position of any station at which angles between three fixed points have been measured to be plotted on paper It consists of three arms the centre arm carries a graduated circle fixed over an axis at one end, the other two are movable round this axis, and each carries a vernier for reading the circle Each arm has a straight edge bevelled as a ruler, and the lines on the prolongations of these edges meet in the centre of the axis, where there is a small opening through which a point may be pricked on the paper The arms having been set to the observed angles, the instrument is moved about until each edge is over one of the fixed points on the paper, when its centre will be exactly over the position of the station if none of the angles are very acute The instrument is much used in nautical surveying, for laying down the position of a vessel at sea by angles measured to fixed objects on shore

Triangular compass The triangular compass is serviceable in reproducing plans to full scale, it is formed by jointing a third leg to the centre pin of the joint of an ordinary pair of compasses, so as to be movable in any direction

Pantagraph The pantagraph is employed in reproducing a map on a different —generally a smaller—scale It consists of two long arms, AB and AC, jointed together at A, and two short arms, FD and FE, jointed together at F and with the long arms at D and E, FD is made exactly equal to AE and FE to AD, so that $ADFE$ is a true parallelogram whatever the angle at A The instrument is supported parallel to the paper on ivory castors, on which it moves freely A tube is usually fixed vertically at c, near the extremity of the long arm AC, and similar tubes are mounted on plates which slide along the short arms BD and FD, they are intended to hold either the axle pin on a weighted fulcrum round which the instrument turns, or a steel pointer, or a pencil, interchangeably When the centres of the tubes are exactly in a straight line, as on the dotted line bfc, the small triangle bfD will always be similar to the large triangle bcA, and then, if the fulcrum is placed under b, the pencil at f, and the pointer at c, when the instrument is moved round the fulcrum as a pivot, the pencil and the pointer will move parallel to each other through distances which will be respectively in the proportion of bf to bc, thus the pencil at f draws a reduced copy of the map under the pointer at c, if the pencil and the pointer were interchanged an enlarged copy would be drawn, if the fulcrum and pencil were interchanged, and the sliders set for f to bisect bc, the map would be copied exactly Lines are engraved on the arms BD and FD, to indicate the positions to which the sliders must be set for the ratios $\frac{1}{2}$, $\frac{1}{3}$, , which are commonly required

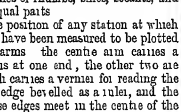

Fig 10

Gavard's pantagraph The square pantagraph of Adrian Gavard consists of two graduated arms which are pivoted on a plain bar and connected by a graduated bar sliding between them throughout their entire length, to be set at any required distance from the plain bar, a sliding plate carrying a vertical tube, to hold either the axle of the fulcrum, the pencil, or the pointer, is mounted on one of the arms and on a prolongation of the plain bar beyond the other arm, and also on the graduated connecting bar, and an additional arm is provided by means of which reductions below or enlargements above the scales given on the instrument can be readily effected

Eidograph The eidograph is designed to supersede the pantagraph, which is somewhat unsteady, having several supports and joints It is composed of three graduated bars, one of which is held over a fulcrum and carries the others, which are lighter, one at each extremity The three bars are movable from end to end in box-sockets, each having an index and a vernier in contact with the graduated scale The box socket of the principal bar turns round the vertical axle of the fulcrum, that of each side bar is attached to a vertical axle, which also carries a grooved wheel of large diameter and turns in a collar at either end of the principal bar The two wheels are of exactly the same diameter and are connected by a steel band fitting tightly into the grooves, so that they always turn together through identical arcs, thus the side bars over which they are respectively mounted, when once set parallel, turn with them and always remain parallel A pointer is held at the end of one of the side bars and a pencil at the diagonally opposite end of the other The bars may be readily set by their graduated scales to positions in which the distances of the pencil and the pointer from the fulcrum will always be in the ratio of the given and the required map scales

Opisometer The opisometer is intended to measure the lengths of roads, rivers, and other lines on a map It consists simply of a milled wheel mounted in a forked handle on a steel screw with a very fine thread The wheel, being turned up to one end of the screw, is put down on the map with the handle held vertically over the point at which the measurement is to commence, and is run over the road or line until the point is reached at which the measurement is to stop, it is then lifted off the paper, placed on the scale of the map, and run backwards to the initial end of the screw, over a length of the scale which corresponds to the length run over on the map

Polar planimeter The polar planimeter was invented by Professor Amsler of Schaffhausen for the measurement of areas on maps and plans It consists essentially of two arms jointed together and a roller, carried at right angles to one of the arms and moving in touch with the paper, which by its revolutions records the area of a figure whose perimeter is traced by a point on that arm, while the instrument is turned bodily on a point on the other arm as a fixed centre There are two forms of the instrument in one the position of the roller is fixed and the arms are jointed on a common pinion, in the other the roller and a pinion, to which the holding arm is attached, are both carried by a slider, which is movable along the tracing arm and can be set at any required distance from the tracing point The first form gives areas in a single unit of measure only, the second in various units The annexed figure represents the first form, showing the joint A, the tracing point P the fixed point O, and the roller with its graduated dial and vernier, for indicating the lengths of line rolled over while the tracer moves round the perimeter of the area under measurement

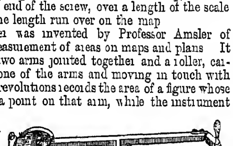

Fig 11

The following explanation of the theory of the instrument is due to Professor Greenhill Let OA, AP be the two arms jointed at A, with the fixed point at O and the tracer at P, and suppose the wheel to be fixed at R on the prolongation of the arm PA Let $OA=a$, $AP=b$, $AR=c$, and the radius of the roller $=r$, and let the direction of a positive rotation of the roller, as marked by the graduations, be that of rotation on a right handed screw on the axle of R which would give motion in the direction AR Drop the perpendicular

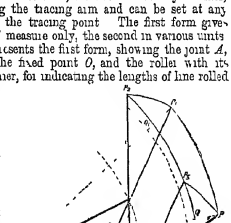

Fig 12

OI from O on AR, and first suppose the joint A to be clamped. Then, if I is in AR produced, a rotation of the instrument about O with angular velocity ω will give to R the component velocities $OI\ \omega$ in the direction IR and $IR\ \omega$ in the direction perpendicular to IR, and will therefore compel the roller to turn with the angular velocity $\frac{RI}{r}\omega$, but, if I is on the other side of R, the angular velocity of the roller will be $-\frac{RI}{r}\omega$. Therefore, keeping A clamped, the roller will turn through an angle $\frac{RI}{r}\theta$ or $-\frac{RI}{r}\theta$, according as I is or is not on the same side of R as A, when the instrument is rotated through an angle θ about O; but, when I coincides with R, the roller will not turn, and then P describes a circle, called the "zero circle," represented by the middle dotted circular line, of radius

$$\sqrt{(OR^2+RP^2)}=\sqrt{\{a^2-c^2+(b+c)^2\}}=\sqrt{(a^2+b^2+2bc)}.$$

Next unclamp the joint A and clamp the arm OA; then the roller will turn through an angle $-\frac{c}{r}\phi$, while AP turns through an angle ϕ.

Now suppose P to travel round the finite circuit $PP_1P_2P_3$ by a combination of the preceding motions in the following order. (1) Clamp the joint, and move P to P_1 and A to A_1 on arcs of circles of centre O; then the roller will turn through an angle $\frac{RI}{r}\theta$, θ being $=AOA_1=POP_1$. (2) Unclamp the joint and clamp the arm, and move the pointer from P_1 to P_2 on the arc of a circle of centre A_1; then the roller will turn through an angle $=-\frac{c}{r}\phi$, ϕ being $=P_1A_1P_2$. (3) Unclamp the arm and clamp the joint, and move the pointer from P_2 backwards to P_3 and A_1 to A, on arcs of circles of centre O, through an angle θ; then the roller will turn through an angle $-\frac{RI_1}{r}\theta$, if OI_1 is the perpendicular from O on P_3A. (4) Unclamp the joint and clamp the arm, and move the pointer from P_3 to P on the arc of a circle of centre A, and consequently through an angle ϕ; the roller will turn through an angle $\frac{c}{r}\phi$, which cancels the angle due to motion (2). Thus in completing the finite circuit $PP_1P_2P_3$ the roller will have turned through an angle $(RI-RI_1)\frac{\theta}{r}=(AI-AI_1)\frac{\theta}{r}$.

But the area $PP_1P_2P_3$ = area PP_1Q_1Q,

$$\begin{aligned}&=\text{sector } OPP_1-\text{sector } OQQ_1=\tfrac{1}{2}(OP^2-OP_3^2)\theta,\\&=\tfrac{1}{2}\{OA^2+AP^2+2AI\cdot AP-(OA^2+AP^2\\&\qquad+2AI_1\cdot AP)\}\,\theta,\\&=(AI-AI_1)\,b\theta,\\&=br\ \text{times the angle turned through by the roller.}\end{aligned}$$

The area $PP_1P_2P_3$ is therefore b times the travel of the circumference of the roller.

Any irregular area, supposed to be built up of infinitesimal elements found in the same manner as $PP_1P_2P_3$, will be accurately measured by the roller when the point P completes a circuit of the perimeter, the arm AP being free to turn on the joint at A and the arm OA on a fixed point O. If, however, O is inside the area, the area of the zero circle must be added to the area deduced from the readings of the roller. When the roller is fixed permanently, this area is constant, and is usually engraved on the arm in units of the adopted length b; when the roller is held on a slider which also carries the pinion of the arm OA, the length b may be so adjusted that the areas described will be expressed in any desired unit of measure.

Clarke, *Geodesy*; *Methods and Processes of the Ordnance Survey*; Col. Waterhouse, *On the Application of Photography to Maps and Plans*; and *Professional Papers of the Royal Engineers*. (J. T. W.)

SUSA, the Biblical SHUSHAN, capital of Susiana or Elam and from the time of Darius I. the chief residence of the Achæmenian kings, was a very ancient city, which had been the centre of the old monarchy of Elam and undergone many vicissitudes before it fell into the hands of the Persians (see ELAM). The site of the town, which has been fixed by the explorations of Loftus and Churchill, lies in the plain, but within sight of the mountains, between the courses of the Kerkha (Choaspes) and the Dizful, one of the affluents of the Pasitigris. The Sháprú, a small tributary of the Dizful, washes the eastern base of the ruin-mounds of Sús or Shúsh. Thus the whole district was fruitful and well watered, fit to support a great city; the surrounding rivers with their canals gave protection and a waterway to the Persian Gulf; while the position of the town between the Semitic and Iranian lands of the empire was convenient for administrative purposes. It is not therefore surprising that Susa became a vast and populous capital; Greek writers assign to it a circuit of 15 or 20 miles,—a statement which is fairly well borne out by the remains. These include three main mounds, of which one is identified with the strong citadel[1] and a second shows the relics of the great palace built by Darius I. and completed by Artaxerxes Mnemon. Susa was still a place of importance under the Sasanians, and after having been razed to the ground in consequence of a revolt seems to have been rebuilt by Shápúr II. under the name of Éránshahr-Shápúr (Nöldeke, *Gesch. d. Perser aus Tabari*, p. 58). The fortifications were destroyed at the time of the Moslem conquest (Mokaddasi, p. 307); but the site, which is now deserted, was inhabited in the Middle Ages, and a seat of sugar-manufacture.

In Daniel viii. 2 the river of Shushan is called Ulai, a name which is identical with Aviai of the Bundehesh and Eulæus of classical writers. What is told of the Eulæus makes it impossible to identify it with the inconsiderable Sháprú; but authorities differ as to whether it is another name for the Choaspes or rather denotes the Dizful or the Pasitigris. Susa in the days of its greatness must have stretched nearly from river to river. There is a sanctuary of the tomb of Daniel on the banks of the Sháprú, and Arabic geographers relate that this tomb was a frequented shrine before the Moslem conquest and that the Arabs turned the stream over the grave.

[1] The Greeks called the citadel the Μεμνόνιον (Strabo, xv. 3, 2), and supposed it to have been founded by the Ethiopian Memnon. It was strong enough to withstand Molon in his war with Antiochus the Great (Polyb., v. 48).

SUSA, a city of Italy, in the province of Turin, 33½ miles west of Turin by the railway which passes by the Mont Cenis tunnel into France, is situated on the Dora Riparia (tributary of the Po) at 1625 feet above the sea, and is so protected from the northern winds by the Rocciamelone that it enjoys a milder winter climate than Turin itself. The city walls, 20 to 30 feet broad at the base, were about 50 feet in height, but in 1789 their ruinous condition caused them to be reduced by about half their elevation. Numerous remains of Roman buildings and works of art still show the importance of the ancient town, and the triumphal arch erected by Cottius in honour of Augustus still stands on the old Roman road between Italy and Gaul,—a noble structure, 45 feet high, 39 broad, and 23 deep. The inscription, now illegible, mentioned fourteen "civitates" subject to Cottius. Among the modern buildings of Susa the first place belongs to the church of San Giusto, founded in 1029 by Olderico Manfredi II. and the countess Berta, and in 1772 raised to be the cathedral. The population of the city was 3254 in 1871 and 3305 in 1881 (commune, 4418).

Segusio (also Secusio, Siosium, Seutium, Senzia, &c.) was at a very early period the chief town of this Alpine region, and the Cottian Alps themselves preserve the name of the Segusian chief Cottius, who with the title of præfectus became a tributary and ally of Rome in the reign of Augustus, and left his state strong enough to maintain its independence till the reign of Nero. As a Roman municipium and military post Segusio continued to flourish. After the time of Charlemagne a marquisate of Susa was established, and the town became in the 11th century the capital of the famous countess Adelaide, who was mistress of the whole of Piedmont. On his retreat from Legnano, Barbarossa set fire to Susa; but the town became more than ever important when Emanuel Philibert fortified it at great expense in the 16th century.

SUSA (*Súsa*), a city of Tunis, on the coast of the gulf of Hamámá, 33 miles south of Hamámá. It occupies the side of a hill sloping seawards, and is still, as far as the town proper is concerned, surrounded with heavy white-

washed Oriental-looking walls. The *Kasr al-Ribát*, a square building flanked by seven bastions, was probably either a Roman or Byzantine fortress, and a Byzantine chapel is now transformed into the *Kahwat al-Kubba* or Café of the Dome. Since the French annexation the citadel, built on the highest point within the town, has been entirely restored and serves as the headquarters of the general commanding a division, and a camp of tile-roofed brick buildings has been erected in the neighbourhood. The space within the walls is proving too limited for the growth of the population, and houses already extend along the shore to north and south for about a mile. Susa is the ancient seaport of Kairwan (45 miles inland), with which it is connected by a horse-tramway, and it has a rapidly increasing commerce. In 1864 the port was visited by about 195 vessels, in 1885 by 701, of which 532 were Italian. The exports in 1885 were valued at £1,371,510 (oil, to Genoa and Leghorn, £232,530, grain, largely to Sicily, £397,760, *sansa* or olive refuse, to France, £13,715, esparto, a comparatively recent article for this port, £17,935), and the imports (including building-stone from Sicily and Malta, brick, lime, marble, and timber) amounted to £660,135. The population, which numbered 8000 in 1872 (2000 Jews, 1000 Christians), had increased to upwards of 10,000 in 1886.

Susa is the ancient HADRUMETUM (*q v*). In 1537 it was besieged by the marquis of Terra Nova, in the service of Charles V, and in 1539 was captured for the emperor by Andrea Doria. But as soon as the imperial forces were withdrawn it became again the seat of Turkish piracy. The town was attacked by the French and the Knights of St John in 1770, and by the Venetians in 1764.

SUSANNA ("Lily"), the heroine of one of the apocryphal additions to the Greek text of the book of Daniel, the others being the *Song of the Three Children* and the story of *Bel and the Dragon*. In the English version the story of the virtuous Susanna—the false accusation brought against her by the elders and her deliverance by the judgment of Daniel—is put as a separate book. Jerome, in his *Preface* to Daniel, points out that it had been observed both by Jews and Christians that this story was certainly written by a Greek, and not translated from Hebrew, since Daniel makes a series of Greek puns on the names of trees.

Plate XI SUSSEX, a maritime county in the south of England, lying between 50° 43′ and 51° 9′ N lat and 0° 49′ E and 0° 58′ W long. It is 76 miles from Lady Holt Park to Kent Ditch, and 28 miles from Tunbridge Wells to Beachy Head, and adjoins Kent on the N E, Surrey on the N, Hampshire on the W, and the English Channel on the S. Its total area is 933,269 acres or 1458 square miles.

Hills The range of chalk hills known as the South Downs divides the county into two districts—that of the coast and that of the Wealden—which are of unequal extent and possess very different characteristics. In the western part of the county the South Downs are about 10 miles distant from the sea, they continue eastwards for about 45 miles, and terminate in the bold headland of Beachy Head. Their average height is about 500 feet, though some of the summits reach 700 (Ditchling Beacon, 813 feet, Chanctonbury Ring, 783, Firle Beacon, 700, and the Devil's Dyke, 697). The Forest Ridge extends through the northern part of the county from Petworth to Crowborough, reaching the coast in Fairlight Down. The principal summits are Crowborough Beacon (796 feet), Brightling Hill (647), and Fairlight Down (528). The county has suffered greatly from incursions of the sea. The site of the ancient cathedral of Selsey is now a mile out at sea. Between 1292 and 1340 upwards of 5500 acres were submerged. In the early part of the 14th century Pagham harbour was formed by a sudden irruption of the sea, devastating 2700 acres. Recently all this land has been reclaimed and again brought under cultivation. There is considerable reason for believing that the whole coast-line of the county has been slightly raised in the last 800 years (possibly by earthquake shock), as the large estuaries at the river mouths no longer exist, and the archipelago round Pevensey (*eye* signifies "island") has only a slight elevation above the neighbouring marsh land.

The rivers are small and unimportant. The principal Rivers are the Rother, the Cuckmere, the Ouse, the Adur, the Arun, and the Lavant. The Rother rises in the Forest Ridge, in the parish of Rotherfield, and enters the sea near Rye, its course having been diverted by a great storm on 12th October 1250, before which date its exit was 12 miles to the east, beyond Dungeness. The Cuckmere also rises in the Forest Ridge, near Heathfield, and empties itself into the sea a little to the east of Seaford. The Ouse rises in St Leonards Forest, to the north-west of Lindfield, and, passing through Isfield and Lewes, enters the sea at Newhaven, now the principal port in the county. The former outlet was at Seaford, but in the reign of Elizabeth the sea broke through the beach bank at some warehouses just below Bishopstone and formed what is now called the old harbour, which was in use until the Newhaven one was made a safer exit. The Adur has three sources, all in the neighbourhood of St Leonards Forest, and flows southwards, entering the sea at Southwick. The mouth of the river formerly shifted from year to year, ranging both east and west over a distance of 2 miles. The Arun rises in St Leonards Forest, in the parish of Slinfold, flows through Amberley and Arundel, and enters the sea at Littlehampton. The Lavant has its source in Charlton Forest and encircles Chichester on all sides except the north, entering the sea through creeks in the extreme south-west corner of the county.

The portion of the county to the north of the South Forests Downs is called the Weald, it formerly formed part of the forest of Andredsweald ("the wood or forest without habitations"), which was 120 miles in length and about 30 in breadth. The total area of forests in 1885 was 113,043 acres, being the greatest of any county in England. About 1660 the total was estimated at over 200,000 acres. The chief remains of the ancient forests are Tilgate, Ashdown, and St Leonards, but the names in many parts indicate their former wooded character, as Hurstpierpoint (*hurst* meaning "wood"), Midhurst, Fernhurst, Billingshurst, Ashurst, and several others. The forests were interspersed with lagoons, and the rainfall being very great caused marshes and the large river estuaries, the rainfall, however, abated in consequence of the cutting down of the Wealden forests for fuel in the extensive ironworks that formerly existed in that district. The wood was exported in the reign of Edward VI.

The greater portion of the county is occupied by the Geology Chalk formation, of which the South Downs are almost entirely composed. Firestone is found in the west, and Steyning is built upon it. At the base of the Downs the Greensand crops up, but is of small extent. The Wealden formations occupy nearly all the inland district of the county, and in these was found the ironstone from which iron was extracted. Sussex was at one time the centre of the English iron manufacture, before 1653 there were 42 iron-forges or mills (reduced to 18 before 1667) and 27 furnaces (reduced to 11 before 1664), which employed 50,000 men[1] and furnished the main supply of ordnance for the national defence. The last forge at Ashburnham was not extinguished until 1809. Between 1872 and 1876 boring was carried on at Netherfield, near Battle, with the object of discovering what beds were below the Wealden, and if possible of reaching the Palæozoic rocks, which at

[1] *Suss Arch Coll*, xxxii pp 22-25

Kentish Town, Harwich, Ostend, and Calais had been found at a depth of about 1000 feet below the sea-level. Some slight hope was entertained of the occurrence of Coal-measures, as in the Boulonnais the Carboniferous limestone, where last seen, dips south. The boring was continued to a depth of 1905 feet, the Oxford Clay being reached. The chief result was the discovery of the unusual thickness of the Kimmeridge Clay, which began at 275 feet from the surface and continued to a depth of about 1469 feet. The most practical result was the finding of thick beds of gypsum (at about 160 feet), which were before unknown in the Weald and are now worked at Netherfield. From Beachy Head to Selsey Bill there lies, south of the Downs, a low and level tract belonging to the Tertiary period, of which there is no such record at any other place in England. The towns of Hove, Worthing, Littlehampton, Bognor, &c., are built on gravel, sand, and loam of the Post-Pliocene or Pleistocene series, and these superficial beds overlie the Eocene series in patches and contain a large fossil fauna. Remains of the mammoth occur in the mud deposit (or *Lutraria* clay) of this district, and the Chichester museum contains the greater portion of a fine skeleton of the *Elephas antiquus* obtained off Selsey Bill. Of the British Quaternary fossils forty-five are peculiar to Selsey, and twenty others probably find here their earliest place in British geological history. The Bracklesham beds occur at the bay of that name, and their main divisions extend from Wittering on the west to the Barn Rocks, east of Selsey Bill, a distance of 7 miles. They are full of fossil shells, particularly nummulitic.[1]

Flora and fauna. An analysis of the flora of the county was placed before the British Association in 1872 by Mr W. B. Hemsley (*Report*, 1872, p. 128), who stated the total number of indigenous plants to be 1000, to which 59 introduced species must be added. The most interesting features of the flora are the number of species to the county area, the species peculiar to certain formations, viz., the Chalk (56), maritime species (76), and the rare species, especially of the Atlantic and Scottish types. Amongst the rarer marsh plants are *Isnardia palustris*, *Scirpus triqueter*, *S. carinatus*, *Pyrola media*, *Habenaria albida*, *Festuca sylvatica* of the "Scottish" type of Watson; this last is not found in adjoining counties. A prominent feature of the Wealden flora is the extent of heath land and the large size the heath attains. The fauna includes 29 species of *Mammalia*. The birds are very numerous, no less than 291 species having been recorded. There are about 76 species of general migratory visitors. Of the 216 species of marine fishes found round the British coasts 106 have been observed off Sussex, and there are also 19 freshwater fish.[2]

Climate. The county presents two distinct climates, that of the coast district being mild, equable, and dry, whilst that of the Wealden district is continental, extreme, and rainy. The coast rainfall is about 25 to 26 inches annually and that of the Weald about 33 inches; this is due partly to the South Downs, which rise up in the path of the rain clouds, and partly to the large extent of forest. In the wet years of 1852 and 1872 the rainfall at several Wealden stations exceeded 50 inches. At Crowborough Beacon the average yearly rainfall from 1871 to 1884 was 38·16 inches; at Brighton during the same period it was only 28·87. Temperature in the Weald at Uckfield has ranged from 98° Fahr. on 14th July to −4° on 20th January 1838. The mean daily range of temperature in the Weald is about half as much again as on the coast. The influence of the sea in modifying the temperature of the coast district is specially noticeable in the autumn months, when the temperature is higher than in the Weald and other parts of England northwards, and fashion has (perhaps unconsciously) selected the period from September to November for the Brighton season. Sea-bathing, first introduced about the middle of the 18th century, together with the fresh pure air, has turned the stream of health seekers from Bath and Tunbridge Wells and other watering places into Sussex. The poor but populous fishing town of Brighthelmston developed into the fashionable town of Brighton, the new town of Worthing sprang up in Broadwater parish, and the fishing village of Eastbourne rose in importance. The Cinque Port town of Hastings afterwards developed its fashionable suburb St Leonards, and Seaford was also resorted to; in the western part of the county the hamlet of Bognor became a fashionable place. The opening of the railway from London to Brighton in 1840, soon followed by coast lines from east to west, occasioned a great increase in the coast towns, and now almost the entire coast (except in its steep parts) presents a line of fashionable "health resorts" unequalled in any English county; these indeed form the special distinguishing feature of Sussex amongst other counties.

Administration. Sussex is divided into the six rapes[3] of Hastings, Pevensey, Lewes, Bramber, Arundel, and Chichester. The only rapes which exist for practical purposes are that of Hastings, which has a separate coroner, and the last three, in which the liability to repair bridges falls as of common right upon the rape instead of the county division. The Act 19 Hen. VII. cap. 24 directed that for convenience the county court should be held at Lewes as well as at Chichester, and this apparently gave rise to the division of Sussex into east and west parts, and separate quarter sessions are now held for these two divisions. The boroughs of Hastings, Rye, Brighton, and the city of Chichester have separate commissions of the peace and courts of quarter sessions. There are eighteen petty and special sessional divisions. At the time of the Domesday survey the county contained 65 hundreds, but the modern total is 68. Of the 7 municipal boroughs which the county contains Arundel, Chichester, Hastings, and Rye existed long before the passing of the Municipal Corporations Act, 1835; Brighton was incorporated in 1854, Lewes in 1881, and Eastbourne in 1883. Winchelsea, Seaford, Pevensey, and Midhurst were unreformed corporations existing under old charters, the first being governed by a mayor and the last three by bailiffs, but all their privileges have lately been abolished. "Sussex," as Mr Freeman observes,[4] "is no shire, no department, but a component element of England, older than England." The diocese of Chichester is nearly coextensive with the county and the old kingdom of Sussex. In the year 681 the county was converted to Christianity by St Wilfrid (afterwards archbishop of York), who founded the see of Selsey, but in 1075 the see was transferred from Selsey to Chichester. The diocese consists of two archdeaconries, Lewes and Chichester, and five deaneries. There are 322 civil parishes, with parts of seven others.

Parliamentary representation. Prior to the Reform Bill of 1832 Sussex returned twenty-eight members to the House of Commons, two for the county and two each for the boroughs of Arundel, Bramber, Chichester, East Grinstead, Hastings, Horsham, Lewes, Midhurst, New Shoreham (with the rape of Bramber), Rye, Seaford, Steyning, and Winchelsea. The borough of New Shoreham was in 1771 added to the rape of Bramber. In 1832 Bramber, East Grinstead, Seaford, Steyning, and Winchelsea were entirely disfranchised, the first named being classed with the worst of the "rotten" boroughs; Arundel, Horsham, Midhurst, and Rye were each deprived of one member; the county was divided into two parts (East and West), each returning two members; and a new borough, Brighton, was created, to which two members were allotted. Chichester and Lewes were each deprived of one member in 1867, and Arundel was disfranchised in 1868. The Redistribution of Seats Act, 1885, disfranchised Chichester, Horsham, Midhurst, New Shoreham (with the rape of Bramber), and Rye, and deprived Hastings of one member. It also divided the county into six (instead of two) divisions, viz., Lewes, Southern or Eastbourne, Eastern or Rye, South-western or Chichester, Northern or East Grinstead, North-western or Horsham, each returning one member. Brighton still retains two members.

Landowners. According to the latest owners of land *Return* (1873), there were 11 proprietors with more than 10,000 acres each, 8 of 5000 to 10,000, 1015 of 100 and less than 5000, of 10 and less than 100 acres, 1677, of 1 and less than 10, 2347, and of less than an acre, 14,675,—making a grand total of 19,733 landowners, having a gross estimated rental of £2,418,522; there were in addition 23,738 acres of common or waste lands. The eleven principal landowners were—Lord Leconfield, 30,221 acres; the duke of Norfolk, 19,217; the duke of Richmond, 17,117; the earl of Chichester, 16,232; the marquis of Abergavenny, 15,364; Rev. John Goring, 14,139; the earl of Ashburnham, 14,051; the earl of Egmont, 14,021; Viscount Gage, 13,739; the Earl De la Warr, 11,185; and the duke of Devonshire, 11,062. At the time of the Domesday survey there were 15 tenants *in capite*, 534 under-tenants, and 2497 *bordarii* (or cottagers), also 765 *cotarii* (or cottars). The custom of borough English, by which land descends to the youngest son, prevailed to an extraordinary degree in Sussex, and no less than 140 manors have been catalogued in which it was found.[5] Gavelkind tenure existed in Rye, in the large manor of Brede, and in Coustard manor (in Brede parish).

Agriculture. The coast district has been under cultivation from the time of the Romans and is very fertile, being specially suitable for market gardens and for growing fruit trees. The fig gardens of West Tarring are celebrated. Marshall,[6] describing the Weald in 1788,

[1] Address to Geological Section of British Association, 1882.

[2] Good lists of fauna and flora of certain parts of the eastern division of the county have been published by the Hastings Literary and Philosophical Society and the Eastbourne Natural History Society.

[3] Probably derived from the Icelandic *hreppr*, signifying land divided by a rope. It is first mentioned in the Domesday survey.

[6] *Rural Economy of the Southern Counties*, &c.

says "The townships of the Weald are in general very large, owing, as it would seem, to the fewness of sites fit for habitation." A large portion of the vale lands remain in a state of common age, particularly on the outskirts and towards the extremities of the district. ... There is scarcely an acre of natural herbage or old grass-land"; of the coast district he observes that there is strong circumstantial evidence that the lands were not only brought to their present form but cultivated before the laying out of town ships. He also mentions that in the Isle of Selsey he observed some common field land, as well as about Chichester. The South Downs afford excellent pasture for sheep, Sussex being famed for a special breed of blackfaced sheep. The total number in 1886 was 518,665,—seventh in order amongst English counties. The total area of land and water in Sussex is 933,269 acres (1881), of which in 1886 there were 682,072 under crops, bare fallow, and grass, made up of 74,518 acres of wheat, 18,067 of barley, 66,509 of oats, 399 of rye, 6307 of beans, and 9493 of pease,—the total of corn crops being 175,293 acres. The green crops were 73,315 acres in extent, including 3405 of potatoes, 28,686 of turnips and swedes, 12,152 of mangolds, 326 of carrots, 11,847 of cabbage, kohl rabi, and rape, and 16,899 of vetches and other green crops. Clover, sainfoin, and grasses under rotation occupied 63,724 acres (47,851 for hay). Permanent pasture or grass amounted to 340,352 acres (117,956 for hay), included chiefly in the South Downs and used for sheep pasture, and the extensive pastures of Pevensey Marsh, used for fattening stock. The total area cultivated with hops was 10,391 acres, Sussex ranking next to Kent. In 1833 the total of hops was only 7701 acres. The number of horses in 1886 was 24,964, of which 20,473 were used solely for agricultural purposes. Cattle in the same year numbered 115,633, of which 40,693 were cows and heifers in milk or in calf. The total of pigs was 41,064. Poultry in 1885 included 317,712 fowls, the fattening of which for the London market forms an important industry in the north-eastern part of the county, the centre being at Heathfield.

Population. The earliest statement as to the population of Sussex is made by Bede, who describes the county as containing in the year 681 land of 7000 families, allowing ten to a family (not an unreasonable estimate at that date), the total population would be 70,000. At the time of the Domesday survey (about 400 years later) the total number of tenants *in capite*, under-tenants, bordarii, cotarii, servi, villani, &c. (in fact all able-bodied males), was 10,410.[1] Assuming each of these to represent a family of ten, the total population was then 104,100. In 1693 the county is stated[2] to have contained 21,537 houses. If seven were allowed to a house at that date, the total population would be 150,759. It is curious, therefore, to observe that in 1801 the population was only 159,311. The decline of the Sussex iron-works probably accounts for the small increase of population during several centuries, although after the massacre of St Bartholomew upwards of 1500 Huguenots landed at Rye, and in 1685 (after the revocation of the Edict of Nantes) many more refugees were added to the county. In 1881 the total population was 490,505, of whom 232,331 were male and 258,174 female. The principal towns were Brighton (population, 107,546; 128,440 in parliamentary borough), Hastings (42,258; 47,738 in parliamentary borough), Chichester (8114), Lewes (10,815), and Rye (4667).

Fisheries. Bede records that St Wilfrid, when he visited the county in 681, taught the people the art of net fishing. At the time of the Domesday survey the fisheries were extensive, and no less than 285 salinæ (or salt-works) existed. The customs of the Brighton fishermen were reduced to writing in 1579. The census of 1851 returned 915 fishermen, but a parliamentary return in 1869 stated the number of men and boys to be 2236, and they manned 780 boats. The census of 1881 returned 1471 fishermen. The approximate value of the fish landed at Brighton yearly is about £20,000.

Manufactures and trade. There are now no important industries, the chief is the brick, tile, and pottery, the main centre of which is St John's Common. The census of 1881 returned 1485 brickmakers in the county. The London, Brighton, and South Coast Railway Company have extensive works at Brighton. There is a daily service of passenger steamers from Newhaven to Dieppe in France, and large quantities of fruit, vegetables, butter, and eggs are conveyed from France to London.

History. The earliest settlers in the county were the Celtic tribes whose memorials are found in the hill-forts of Mount Caburn, Hollingbury, White Hawk, Ditchling Beacon, Devil's Dyke, Chanctonbury Hill, Cissbury, &c., the latter being a great factory for flint implements. They gave the names to the rivers. Little is, however, known respecting them beyond the fact that they had a distinct coinage some two centuries before the Roman invasion,—a coarse imitation of the Greek stater of Philip II of Macedon. These coins have been found in various parts of Sussex. At the time of Cæsar's landing (55 B.C.) the Belgic tribe of the Regni inhabited the county and had their capital at Regnum (Chichester). Sir G. B. Airy fixed on Pevensey as the place of Cæsar's landings in 55 and 54 B.C., this is, however, much disputed, and opinion generally puts the landing near Deal. A few years after this Sussex appears to have formed part of the kingdom of Commius, a British chieftain, and upon his death seems to have been allotted to his son Tincommius. These two are the only British rulers of the county whose coins have been found. Upon the conquest of Britain under Claudius the Romans found a ready tool in a king named Cogidubnus, who is mentioned by Tacitus, and who was created imperial legate, and may probably be identified with the king of that name mentioned in the celebrated inscription on the temple of Neptune and Minerva found at Chichester. Sussex was reduced to submission prior to the reign of Vespasian, and Major-General Pitt-Rivers suggests that the hill-fort of Mount Caburn may have been one of the twenty oppida Suetonius states to have been reduced by that emperor. Roman settlements became numerous in the county and villas sprang up, the remains of which are still occasionally found, the chief being that at Bignor, near Stane Street, the Roman road connecting Chichester with London and still partly traceable. A fortress was erected at Anderida (Pevensey), and there was another town named Mutuantonis, which is thought to be Lewes; but, having regard to the Antons in West Sussex, it may have been situated farther west than Lewes, perhaps at Littlehampton. Sussex was the first county invaded by the Saxons, who in 477 landed under Ælle at Keynor near Chichester. After fourteen years of struggle they reached the point where the South Downs abut on the sea at Beachy Head, and in 491, as the *Saxon Chronicle* grimly records, "Ælle and Cissa beset Andredes ceaster (Anderida), and slew all that were therein, nor was there a Briton left there any more." This resulted in the formation of a distinct kingdom of South Saxons, whence its name of *Sussex*. The subjugation of the county was very complete, for it is still one of the most thoroughly Saxon counties in England, and its inhabitants, speech, place-names, customs, &c., are almost entirely Saxon. The next important event in the history of the county was the landing of William of Normandy (28th September 1066), followed by the battle of Senlac[3] or Hastings (14th October 1066). The Conqueror erected on the battlefield a state abbey dedicated to St Martin, but it was not completed until after his death. The next chief event was the battle of Lewes between Henry III and the barons under Simon de Montfort in 1264, which "wiped out the stain—if stain it were—of Senlac." The only other important events have been the rebellion of Jack Cade in 1450, which received very substantial support in East Sussex, and the naval engagement fought off Beachy Head in 1690, in which the English and Dutch fleets combined were defeated by the French. Charles II in his flight after the battle of Worcester escaped in 1651 from Brighton in a fishing-boat.

The foremost place amongst the illustrious natives of Sussex must be assigned to Shelley the poet. Of statesmen we have Richard Cobden and John Selden, and of eminent ecclesiastics Archbishops Frewen, John Peckham, and William Juxon, also Archdeacon Hare. Its poets include Thomas Otway, Thomas Sackville (afterwards earl of Dorset), and John Fletcher. Of antiquaries we find Sir William Burrell, John Elliot, Rev. Thomas W. Horsfield, Mark Antony Lower, Dr Mantell (geologist), and Dr Richard Russell (founder of modern Brighton).

Dialect.—A large number of Saxon words are still retained and pronounced in the old style; thus *gate* becomes *ge-at*. The letter *a* is very broad in all words, as if followed by *u*, and in fact converts words of one syllable into words of two, as *faus* (face), *taust* (taste), &c. Again, *a* before double *d* becomes *ar*, as *arder* and *larder* for *adder* and *ladder*; *oi* is like a long *i*, as *spile* (spoil), *intment* (ointment); an *e* is substituted for *a* in such words as *rag*, *flag*, &c. The French refugees in the 16th and 17th centuries introduced many words which are still in use. Thus a Sussex woman when unprepared to receive visitors says she is in *dishabille* (déshabillé, undress); if her child is unwell, it looks *peked* (piqué); if fretful is a little *peter-grievous* (petit-grief); she cooks with a *broach* (broche, a spit), and talks of *coasts* (coste, Old French) or ribs of meat, &c. There is an excellent *Dictionary of the Sussex Dialect* by the Rev. W. D. Parish.

Bibliography.—Amongst standard historical works dealing with Sussex history are E. A. Freeman's *History of the Norman Conquest* and *Life of William Rufus*; J. R. Green's *Making of England*; W. H. Blaauw's *The Barons' War*; and Kemble's *Saxons in England*. The general history of the county is dealt with in Horsfield's *History of Sussex*, Dallaway and Cartwright's *History of the Western Division of the County of Sussex*, M. A. Lower's *Compendious History of Sussex*, Dudley C. Elwes and Charles J. Robinson's *History of the Castles, Mansions, and Manors of Western Sussex*, P. de Putron's *Nooks and Corners of Old Sussex*, W. R. W. Stephens's *Diocesan Histories (The South Saxon Diocese Selsey—Chichester)*, *Sussex Archæological Society's Collections*, 34 vols., and index to the first 25 vols.; *Domesday Book in relation to the County of Sussex* (1886). SUTHERLAND, a northern maritime county of Scotland, is bounded E by Caithness, S E by Moray Firth, S and S W by Ross and a part of Cromarty, and N and W by the Atlantic and the North Sea The area is 1,297,846 acres, or nearly 2028 square miles The northern and western shores are broken and irregular, in some cases deeply indented, and in the north-west, at Cape Wrath, near Durness, at Whiten Head, and farther south at the island of Handa there are ranges of wildly precipitous cliffs Numerous islands stud the larger inlets on this coast, the only ones inhabited in 1881 were Oldney with four persons and Roan (in Kyle of Tongue) with forty-three, Handa, which had eight inhabitants in 1871, had none in 1881 On the north coast the principal sea lochs are the Kyle of Tongue, Loch Eriboll, and the Kyle of Durness, and on the west coast Loch Inchard, Loch Laxford, the various branches of Eddrachillis Bay, and Loch Inver The eastern shore is low and comparatively regular, the only inlets being Loch Fleet and Dornoch Firth With the exception of the narrow plain along the east coast, various stretches of low ground on the west coast, and the low grounds adjoining the rivers and inland lochs, the surface consists chiefly of a succession of irregular elevations of from 500 to over 3000 feet in height Much of the western district adjoining the coast from Cape Wrath southwards is occupied by Archæan gneiss, forming a series of bare rounded knolls Resting unconformably on the gneiss are deposits of grits and sandstones, generally regarded as of Cambrian age, rising into wild cliffs between Cape Wrath and the Kyle of Durness These are succeeded unconformably by Silurian strata, specially developed in the neighbourhood of Durness and Eriboll, in the former region they form a basin occupied chiefly by the limestone series, containing a remarkable collection of fossils, and at Eriboll, from which the strata at Durness are separated by a great dislocation, they present a remarkable series of horizontal displacements Towards the east the gneiss is intermixed with granite and syenite, which cap the summits of a few of the mountains Outliers of Old Red Sandstone also occur in this eastern mountainous region, sometimes in masses of coarse conglomerate The highest mountain summit in Sutherland is Benmore Assynt (3273 feet), the culminating peak of a fine range of Silurian quartzites and limestone rocks lying to the south-east of Loch Assynt, while to the south-west are the picturesque conical summit of Canisp (2779 feet) and the curious Sulven (2399 feet) with its forked top The next highest and most picturesque series of mountain groups occurs in the north-eastern region, south of the Kyle of Tongue,—Ben Hope, a rounded mass with imposing precipices rising near Loch Hope to a height of 3040 feet, while to the eastward is the picturesque Ben Loyal or Laoghal (2504 feet), formed of granite, and south from it, near Loch Naver, the great bulk of Ben Klibreck (3154 feet) Numerous other summits attain a height of over 2000 feet, but the greater proportion of the mountainous region consists of elevated moorlands, bleak and uninteresting, except when the heather assumes its purple tints in autumn In the lower region along the shores of Moray Firth the Old Red Sandstone occurs resting unconformably on the crystalline series of rocks, and is in turn succeeded by an interesting series of Jurassic strata, which, faulted against the older formations, are exposed along the coast from Golspie to Helmsdale. In this series, at Brora, some seams of coal have been worked, but the presence of iron pyrites greatly lessens its value Limestone is wrought in various districts, and there are a number of quarries for building stone Small quantities of gold have been found in some places

Sutherland has a much greater proportion of its area occupied by water than any other large county in Scotland, the parish of Assynt being completely honeycombed with lochs and tarns Loch Assynt, the largest of these, 10 miles in length, and narrow and irregular in outline, is entitled to rank, from its picturesque creeks and the grandeur of the adjoining mountain scenery, as the most beautiful loch in Sutherland Loch Shin, extending 17 miles throughout nearly the whole of Lairg parish, from south-east to north-west, is towards the centre overhung by mountain masses, but otherwise is without interest to any but the angler It is succeeded northwards by a series of lochs,—Griam, Merkland, More, Stack, Garbadmore, Garbadbeg—extending through the centre of the parish of Eddrachillis Lochs Merkland and Griam occur, like Loch Shin, in the course of the river Shin, a tributary of the Oykel, which last forms the southern boundary of the county with Ross and falls into Dornoch Firth, Lochs More and Stack are in the valley of the Laxford, running north-westward to Loch Laxford The Dionard or Grudie flows northwards to the Kyle of Durness, and the Hope, after expanding into Loch Hope, about 10 miles in length, falls into Loch Eriboll The Borgie, which in its course forms Loch Loyal and falls into Torrisdale Bay, the Naver, which flows from the loch of that name through a fertile strath to the sea at Bettyhill of Farr, the Strathy, and the Halladale are the principal other rivers flowing northwards Those entering Moray Firth are the Oykel, the Helmsdale, which reaches the sea at the town of that name, the Brora, which receives various tributaries before it expands into Loch Brora, 3 miles from its entrance into the sea at Brora, and the Fleet, flowing into Loch Fleet

Agriculture—According to the agricultural returns of 1886 only 33110 acres out of 1,347,033 were in cultivation, less than a fortieth part of the whole area The best land is that adjoining Moray Firth, where agriculture is in a very advanced condition Along the river valleys there are, however, many fertile patches At the beginning of the 19th century the crofters occupied almost every cultivable spot throughout the county, between 1811 and 1820 they were ejected from their holdings to the number of 15,000, and, according to the statement of Hugh Miller, "compressed into a wretched selvage of poverty and suffering that fringes the county on its eastern and western shores" The homes they left were, he says, "improved into a desert", but in the opinion of those who made the alteration these mountainous parts were as "much calculated for the maintenance of stock as they were unfit for the habitation of man" The crofters in Sutherland are now (1887) chiefly confined to the western seaboard, the number of crofts, all on the estates of the duke of Sutherland, amounting, according to the *Report of the Crofters Commission*, to 1238, and representing a population of 6190 The general agricultural condition of the county has been much improved by successive dukes of Sutherland, aided by the liberality of the Government in the advancement of money for the construction of roads and bridges, and within recent years large reclamations have been made, in order to obtain a wider area for the growth of fodder and turnips The following table gives the number and acreage of various classes of holdings in 1875, 1880, and 1885 —

Year	50 acres and under		50 to 100 acres		100 to 300 acres		300 to 500 acres		500 to 1000 ac		Above 1000 ac		Total	
	No	Ac	No	Ac	No	Ac	No	Ac	No	Ac	No	Ac	No	Ac
1875	2505	11,994	29	2069	42	6939	9	3576	4	2212	.		2589	26,790
1880	2498	12,539	34	2541	40	6661	15	5730	5	2689			2592	30,160
1885	2512	13,232	44	3259	41	7399	14	5221	5	2809	2	8050	2618	40,063

In 1885 of the class of holdings not exceeding 50 acres in extent 68 were between 20 and 50 acres each, 661 between 5 and 20, 1764 between 2 and 5, and 19 between ¼ and 1 acre

Out of the 33,110 acres under tillage in 1886 there were 10,343 under corn crops, 5052 under green crops, 8861 rotation grasses,

8602 permanent pasture, and 252 fallow. The principal corn crop is oats, which occupied 8392 acres, barley occupying 1815, rye 63, pease 24, and wheat only 19. Potatoes occupied 2014 acres and turnips and swedes 2981. Cattle, chiefly West Highland, short-horn, and crossbred, numbered in 1886 12,806, of which 5576 were cows and heifers in milk or in calf; horses, which include a large number of ponies, although Clydesdales are used on the large farms, numbered 2665, of which 2015 were used solely for purposes of agriculture; sheep, the rearing of which is the staple business of the county, the principal breed being Cheviots, numbered 211,825, of which 158,961 were two years old and above; and pigs, 1037. According to the *Report of the Crofters Commission*, there were four deer forests within the county, all belonging to the duke of Sutherland, viz., Ben Armin and Con-na-feain, 35,840 acres; Dunrobin, 12,180; Glencanisp, 34,490; and Reay, 64,600; in all 157,110 acres, or more than one-ninth of the total area. There is a comparatively small area under woods,—only 12,260 acres in 1881.

According to the latest (1873) owners and heritages *Return* the land was divided among 433 proprietors possessing 1,297,253 acres at an annual value of £71,494, or 1s 1¼d an acre all over. There were 348 proprietors who possessed each less than one acre, the total amount which they owned being only 59 acres. The bulk of the land is possessed by the duke of Sutherland, who owned 1,176,454 acres, the other proprietors possessing above 10,000 acres each being Sir Charles W. A. Ross, 55,000; E. C. Sutherland-Walker, 20,000; Sir James Matheson, 18,490; and the executors of Gordon M'Leod, 11,000. The total valued rental of the county in 1674 was only £27,193 Scots or £2266 sterling while in 1885-86 it was £103,979.

Communication.—The county is well supplied with roads considering its mountainous character and its sparse population. Helmsdale affords the means of export for a considerable amount of farm produce. The Highland Railway enters the county at Invershin and after passing northwards to Lairg turns eastwards to the coast, which it skirts to Helmsdale, whence it turns north-westwards along the banks of the Helmsdale, bending afterwards eastwards at Forsinard into Caithness.

Industries.—Various textile manufactures at one time established in the county have been discontinued, the only important manufacture now remaining being that of whisky at Clyne and Brora. Herring fishing prosecuted from Helmsdale is an important industry, and the cod, ling, and other deep-sea fishings engage a large number of boats and men. There are valuable salmon fisheries in several of the rivers.

Administration and Population.—The county contains 13 entire parishes and part of the parish of Reay, the remainder being in Caithness. The county returns one member to parliament, and one is returned for the Wick group of burghs. Dornoch, the only royal burgh, had but 497 inhabitants in 1881, while Golspie had 1548 and Helmsdale 794. The population has not varied greatly in numbers since the beginning of the 19th century. In 1801 the numbers were 23,117, and in 1881 they were 23,370, a gradual decrease having taken place since 1851, when the numbers reached 25,793. In 1881 there were 11,219 males and 12,151 females. Sutherland is the most sparsely peopled county in Scotland, there being only 12 persons to the square mile, while the average for Scotland is 125. Sutherland forms a joint sheriffdom with Ross and Cromarty, and a sheriff-substitute resides at Dornoch. Small debt circuit courts are held at Helmsdale, Tongue, Melvich, and Scourie, and justice of peace courts at Dornoch, Golspie, Brora, and Helmsdale.

History and Antiquities.—The ancient Celtic inhabitants were almost entirely expelled by the Scandinavian settlers who occupied the county after its conquest by the Norse jarl Thorfinn in 1034. The remains of Pictish towers are numerous, as are also stone circles. Of other antiquities mention may be made of the vitrified fort on Dun Creich and of the extensive remains of Dun Dornadilla in Durness parish. After the conquest of the district by the Scottish kings, Sutherland was conferred on Hugh Freskin (a descendant of Freskin of Moravia or Moray), whose son William in 1228 was created earl of Sutherland by Alexander II. The nineteenth earl of Sutherland was created duke in 1833. The seat of the ancient episcopal see of Sutherland and Caithness was at Dornoch, where a cathedral was erected by Gilbert of Moravia (1222-1245), of which the ancient tower, attached to the modern parish church, still remains.

See Sir Robert Gordon's *History of the Earldom of Sutherland*, 1813; Hugh Miller's *Sutherland as it is*, 1843; and C. W. G. St John's *Tour in Sutherlandshire*, 1849. (T. F. H.)

SUTTEE, the name given by English writers to the rite of burning a widow on the funeral pyre of her husband as practised among certain Hindu castes, and especially among the Rajputs. The word *satī* (as it should rather be written) properly denotes the wife who so sacrifices herself, not the rite itself, and means "a good woman," "a faithful wife." The sacrifice was not actually forced on a wife, but it was strongly recommended by public opinion as a means to her own happiness and that of her husband in the future state, and the alternative was a life of degraded and miserable widowhood. The practice was current in India when the Macedonians first touched that country (Diod. Sic., xix. 33), and it lasted into the 19th century, having been tolerated even by English rulers till 1829. (See INDIA, vol. xii. p. 806.) The subject is illustrated by copious quotations from ancient and modern authorities in Yule's *Anglo-Indian Glossary*, p. 666 *sq.*, and by comparison of similar rites among other nations in Tylor's *Primitive Culture*, ch. xi. It has its root in the primitive view of the future life, which regards the dead as having similar needs to the living. The wife is sent into the world of shades with her husband, just as arms, clothing, or treasure are buried in his tomb, or slaves are slain to attend their master in the underworld. The Indian custom is not, therefore, properly a part of Brahmanism; but it was adopted by the ministers of that religion, who strained their sacred texts to find support for it.

SUTTON COLDFIELD, an ancient market town and municipal borough of Warwickshire, England, is situated on the London and North-Western Railway, 8 miles south of Lichfield and 7 north-east of Birmingham. The town has been greatly increased of late years by the erection of villas for persons having their business offices in Birmingham, Walsall, and other towns. The church of the Holy Trinity—Early English and Late Perpendicular, restored in 1874 and enlarged in 1879—contains a fine Norman font and the tomb of Bishop Vesey. He obtained from Henry VIII the grant of the park and manorial rights for the benefit of the town, the annual value (now about £2000) being expended in charities and education. On the picturesque park near the town, 2400 acres in extent, the inhabitants have the right of grazing horses and cattle at a small fee. A town-hall was erected in 1859; in it there is a good library. The corporation formerly consisted of a warden and 24 members; but in 1885 Sutton obtained a municipal charter, by which it is divided into six wards, with an alderman and three councillors for each ward. The population of the township in 1871 was 5936, and in 1881 it was 7737.

Sutton was at one time a royal manor and an apanage of the earls of Warwick. It owes much of its prosperity to the gifts of John Vesey (Voysey), bishop of Exeter in the 16th century, who was a native of the place. In its charter of incorporation, 20th Henry VIII., it is called the royal town of Sutton Coldfield.

SUTTON-IN-ASHFIELD, a town of Nottinghamshire, England, is situated on an eminence on the Nottingham and Worksop and the Erewash Valley Railways, 3 miles west-south-west of Mansfield. The church of St Mary Magdalene of the 12th century was restored in 1868. In the churchyard is a yew tree reputed to be 700 years old. There are a number of collieries and limeworks in the vicinity. Cotton hosiery and thread are the principal manufactures. The duke of Portland is lord of the manor. The population of the urban sanitary district (area, 4855 acres) in 1871 was 7574, and in 1881 it was 8523.

SUWAŁKI, a government of Russian Poland, occupies the north-east corner of the kingdom, extending to the north between East Prussia and the Russian governments of Kovno, Vilna, and Grodno. Its area is 4846 square miles. It covers the east of the low swelling, studded with lakes, which skirts the south coast of the Baltic (see POLAND), its highest parts reaching 800 to 1000 feet above the sea. Its northern slopes descend to the valley of the lower Niemen, while in the south it falls away gently to the marshy tract of the Bebrz. The rivers flow there in deep gorges and valleys, diversifying the surface. Suwałki is watered by the Niemen, which forms its eastern and its northern boundary and is largely used as a channel of communication; it has many affluents from both slopes

of the swelling. The Augustowo Canal connects the navigable Hancza, tributary of the Niemen, with a tributary of the Bebrz, which belongs to the basin of the Vistula, and an active traffic is carried on on this canal. The population was 606,573 in 1883, the increase being 3400 during the year. It has a most varied composition, embracing Lithuanians (the prevailing element), who number about four-tenths of the whole (Zhmuds, 31.5 per cent., Lithuanians proper, 10.3), Poles (28.4, of whom 5.3 are Mazurs), Jews (17.2), Germans (6.8, but they are rapidly increasing), and White Russians (4.6). In religion the Catholics are predominant (449,476 in 1883), the Jews come next (98,743), there are also 38,610 Protestants, 13,275 Orthodox Greeks, and 6246 Raskolniks.

Tertiary and Chalk deposits are widely spread in Suwałki, and the entire surface is covered with Post Tertiary deposits. The bottom moraine of the great ice sheet of North Germany, containing scratched boulders and furrowed by depressions having a direction north-north east to south south west,[1] covers immense tracts of the ridge of the lake districts and its slopes, while limited spaces are covered with well washed glacial sands and gravel. On the northern slopes of the coast ridge, the boulder clay being covered with lacustrine deposits, there are at many places layers of fertile soil, and in the southern parts of the province the boulder clay is very stony, and sometimes covered with gravel. Still, nearly nine tenths of the surface are considered suitable for cultivation. Agriculture is the chief occupation, and potatoes are extensively grown for export to Prussia, where they are used for the manufacture of spirits, which are smuggled into the province. The manufactures are unimportant (600 workmen, annual produce valued at £124,000, one half being due to distilleries). All manufactured wares are imported, mostly from Prussia, and all trade is in the hands of Jews. The educational institutions include two gymnasia for boys, one for girls, one seminary for teachers (at Weiwery), one Catholic seminary, and 196 lower grade schools, having altogether an aggregate of 13,193 scholars in 1884. Suwałki is divided into seven districts, the chief towns of which with their populations in 1882 were—SUWAŁKI (see below), Augustowo (11,100), Kalwarya (10,600), Mariampol (5610), Seiny (4035), Wilkowiszki (6700), and Władisławow (9300). Wierzbolowo (3550), an important custom house, situated on the railway from St Petersburg to Berlin, also has municipal institutions.

SUWAŁKI, capital of the above government, is situated at the source of the Hancza, tributary of the Niemen, 75 miles north-west of Grodno. In the 15th century it was but a small village, lost amidst forests, and peopled by Lithuanians. In the end of the 18th century it became the capital of the Augustowo government, but never had any importance, except as the seat of the local authorities. Since 1834 it has been the capital of the government of Suwałki. Its population was 18,640 in 1882.

SUWAROFF, or SUVOROFF, ALEXANDER VASILIEVICH (1729-1800), Russian general, was born at Moscow on 24th November 1729, the descendant of a Swede named Suvor who emigrated to Russia in 1622. Suwaroff entered the army at an early age and first distinguished himself at the battle of Kunersdorf in 1759, where he acted as aide-de-camp to General Fermor. Throughout the Seven Years' War he was conspicuous for his bravery and military skill. He next took part in the battles between the Russians and Poles at the period of the first dismemberment of Poland. Being afterwards transferred to the banks of the Danube (1773), he there in the campaigns against the Turks laid the foundation of his reputation as a military commander. In 1775 he put an end to the formidable revolt of Pugatcheff, who was brought in chains to Moscow and there decapitated. In 1789 Suwaroff defeated the Turks at Fokshani (Moldavia), and again in the same year on the Rimnik. In 1790 he took by assault the town of Ismail, on which occasion he sent his well-known couplet to the empress. On the termination of this war Suwaroff was summoned to another campaign against the Poles. After the defeat of Kosciusko by Fersen at Maciejowice in Siedlce (1794) he marched on Warsaw, and captured its suburb Praga, where 15,000 Poles were massacred. Upon this the city capitulated, and the Russian general was made field-marshal. He remained in Poland till 1795 and was received in triumph on his return to St Petersburg. In November 1796 the empress Catherine, his firm friend and admirer, died. On the accession of Paul, who always laboured to undo his mother's work, Suwaroff fell into disgrace and was banished to his country-seat at Kontchanskoe in the government of Novgorod. There he remained some time in retirement. He unsparingly criticized the new military tactics and dress introduced by the emperor, and some of his caustic verses reached the ears of Paul. His conduct was therefore watched and his correspondence with his wife, who had remained at Moscow—for his marriage relations had not been happy—was tampered with. On Sundays he tolled the bell for church and sang among the rustics in the village choir. On week days he worked among them in a smock frock. But in February 1799 he was summoned by the emperor to assist in the campaign with the Austrians against the French. Suwaroff took command of the combined forces at Verona. He attacked Moreau, the French general, at Cassano, the ford of the Adda, and completely defeated him, taking about 3000 prisoners, he then made a triumphal entry into Milan. He next defeated Macdonald on the Trebbia in a sanguinary engagement which lasted three days, from the 17th to the 19th of June (1799). Soon afterwards Joubert was defeated and slain at Novi (15th August). But the importance of these successes was neutralized by the constant squabbles between Suwaroff and the Austrian commanders. The Russian general now received orders to join Korsakoff in Switzerland and to assist him in driving the French from that country. He accordingly crossed the Alps, suffering severe losses, but on his arrival learned that Korsakoff had been previously defeated by Massena. It only remained for him to effect a retreat with the shattered remains of his army. He finally reached his winter quarters, between the rivers Iller and Lech, and thence directed his homeward march to Russia. The emperor Paul, who soon after this time entirely changed his policy and made an alliance with Bonaparte, recalled Suwaroff in disgrace, and on his return refused to see him. The veteran retired to his country-seat, where he died on the 18th of May 1800. Lord Whitworth, the English ambassador, was the only person of distinction present at the funeral of this remarkable man. He lies buried in the church of the Annunciation in the Alexandro-Nevskii monastery, the simple inscription on his grave being, according to his own direction, "Here lies Suwaroff."

Among the Russians the memory of Suwaroff is cherished as that of a great and successful general, but he hardly enjoys such a reputation among foreigners, who generally look upon his victories as due rather to the huge masses of men under his control than to military genius. His tactics seem to have been somewhat Oriental. He formed no general plans for his campaigns, but trusted to celerity of movement and blows rapidly struck. He was terribly reckless of human life, neither sparing his own soldiers nor showing mercy to the conquered. And yet we find him the subject of exaggerated eulogy among English writers in the early part of the 19th century. He was a man of great simplicity of manners, and while on a campaign lived as a common soldier, sleeping on straw and contenting himself with the humblest fare. But he had himself passed through all the gradations of military service, and had been for many years a private soldier, moreover, his education had been of the rudest kind. He affected the habits of a humourist, and his gibes procured him many enemies. He had all the natural contempt of a man of ability and action for ignorant favourites and ornamental carpet knights. Droll stories, in keeping with the well known eccentricity of his character, are told of his manner of life in camp.

SVEABORG, an important fortress of Finland, built by Count Ehrensvard in 1749 on seven small islands off the harbour of HELSINGFORS (*q.v.*). It is the seat of a great naval harbour and arsenal.

[1] Hedroits, in *Proc Russ Geol Committee*, iii., 1884.

SWABIA, SUABIA, or SUEVIA (Germ. *Schwaben*), is the name of an ancient duchy in the south-west part of Germany, afterwards transferred to one of the ten great circles into which the empire was divided in the reign of Maximilian I. (1493–1519). At present the official use of the name is confined to a province of Bavaria (capital, Augsburg), comprising a mere fragment of the former Swabia, but in common use it is still applied to the districts included in the old duchy. The duchy of Swabia was bounded on the N. by the Rhenish Palatinate, on the E. by the Lech (separating it from the duchy of Bavaria), on the S. by Switzerland, the Lake of Constance, and Vorarlberg, and on the W. by the Rhine. It corresponds roughly to the modern Wurtemberg, Baden, and Hohenzollern, with part of Bavaria. The circle of Swabia coincided more nearly than most with the duchy from which it was named, but was rather more extensive. It was bounded by Switzerland, France (after the cession of Alsace), and the circles of the Upper and Lower Rhine, Franconia, Bavaria, and Austria. Its area was about 13,500 square miles. The Swabian circle contained more independent states of the empire than any other, including the countship (afterwards duchy) of Wurtemberg, the margraviate of Baden, the principalities of Hohenzollern and Liechtenstein, a whole series of smaller secular and ecclesiastical principalities, and upwards of thirty free imperial towns (Augsburg, Ulm, &c.). Swabia is intersected from west to east by the Danube, and is one of the most mountainous (Black Forest, Swabian Jura) and picturesque parts of the German empire. It is also very fertile. The Swabians are a strong, big-framed, and good-humoured race, and, though in several popular legends the "Schwab" plays the part of a "wise man of Gotham," he is probably no denser than his neighbours.

The use of the name of Swabia in connexion with the south-west part of Germany, previously called Alemannia (see ALEMANNI), begins with the 5th century of our era, when the Suevi poured into the country and amalgamated with the Alemanni. It was not, however, till the 8th century, when the dukedom of Alemannia was abolished and Rhætia and Alsace separated from it, that Swabia became the recognized name of the district, henceforth administered by nuncii cameræ, as representatives of the Frankish emperors. One of these nuncii, who usurped the ancient title of duke of Alemannia, was executed in 917, but two years later Henry I. yielded to the popular will in allowing Count Burkhard I. to style himself duke of Swabia. The dukedom thus founded, which lasted for more than three centuries, repeatedly changed hands, and was generally conferred by the emperors and kings of the Saxon and Franconian lines on members of their own families. In 1079 it passed into the hands of Frederick I. of Hohenstaufen, the progenitor of a line of German monarchs, and under his successors Swabia had the reputation of being the most civilized and prosperous part of Germany. As, however, the Hohenstaufen line gradually lost strength in its hopeless struggle with the papacy, the Swabian nobles increased in power at the expense of the dukes, and several of them became "immediate." No duke of Swabia was appointed after the death of Conradin, the last of the Hohenstaufen, in 1268, and his place was henceforth filled in some degree by the count of Wurtemberg as *primus inter pares*. For the next 250 years or so the history of Swabia consists of an endless series of feuds between the different members of the duchy, mingled with more or less abortive attempts of the German emperors and others to restore peace. The lesser nobles fought with the greater nobles, the towns banded themselves together against both, and alliances and counter alliances were formed and dissolved with bewildering rapidity. The "Schleglerkrieg" is the name given to a bloody contest between the counts of Wurtemberg and the lesser noblesse in 1367. The most important of the various leagues formed by the towns was the "Schwabischer Stadtebund" of 1376, the point of which was directed against Wurtemberg. In 1488 the Swabian estates,—nobles, prelates, and towns,—weary of constant dissension, joined in the Great Swabian Confederation, the object of which was to maintain peace throughout the country. This league possessed a carefully drawn up constitution and exercised executive and judicial functions throughout the whole of Swabia, maintaining a standing army to give force to its decrees. Though not successful in completely abolishing war within Swabia, the confederation was by no means a failure. It was, for instance, the general of the confederation that put an end to the calamitous Peasants' War of 1525. The Reformation found ready acceptance in Swabia. Wurtemberg, Ulm, and some of the other estates even joined in the Schmalkald League, but for this they afterwards had to pay large fines to the emperor, while the towns lost their democratic constitution, and with it most of their political importance. The outstanding feature of Swabian history for some time afterwards may be said to be the struggle for supremacy between the Protestant Wurtemberg and the Roman Catholic Austria. In 1512, when all Germany was divided into ten circles, one of them was named the Schwabischer Kreis, or Swabian Circle (see above). The circle received its complete organization in 1563, and retained it practically unchanged till the dissolution of the empire in 1806. Swabia suffered severely in the Thirty Years' War, and it was also one of the scenes of the struggles consequent on the French Revolution. But its modern history must be sought for under such headings as WURTEMBERG and BADEN.

SWAHILI (*Wa-Swahili, i.e.*, "Coast People," from the Arabic *sáhil*, coast), a term now commonly applied to the inhabitants of Zanzibar and of the opposite mainland between the parallels of 2° and 9° S., who are subjects of the sultan of Zanzibar, and whose mother-tongue is the Ki-Swahili language. According to present local usage no person would be called a Swahili unless he verified these two conditions. The Swahili are essentially a mixed people, in whom the Bantu and Arab elements are mingled in the proportion of about three to one; and the same is true of their speech, which of all the Bantu dialects has been most affected by Arab and other influences. The interest attaching to the Swahili people, who have figured so largely in the history of African enterprise during the last half century, is thus of a social rather than of a strictly scientific character. The energy and intelligence derived from a large infusion of Semitic blood has enabled them to take a leading part in the development of trade and the industries, as shown in the wide diffusion of their language, which, like the Hindustani in India and the Guarani in South America, has become the principal medium of intercommunication throughout most of the continent south of the equator. During his journey from the Indian Ocean to the Atlantic Commander Cameron found that a knowledge of this language enabled him everywhere to dispense with the aid of an interpreter, as it was understood by one or more persons in all the tribes along the route. Owing to this circumstance the intelligent and enterprising natives of Zanzibar have been found indispensable assistants in every expedition penetrating from the eastern seaboard to the interior since they began to be employed by Speke and Burton as porters and escorts. Missionary enterprise has been at work amongst the Swahili, who are all Mohammedans, but with poor results. The language, however, has been carefully studied, and is now better known than perhaps any other member of the Bantu family. There are several varieties, of which the chief are—the archaic Ki-Ngozi in the north about the river Tana, mostly free from foreign elements; the Ki-Mvita of the Mombasa district, reduced to writing by Krapf; and the Maneno Unguya of Zanzibar, which is most affected by Arabic, Persian, Indian, and other foreign influences, but which, nevertheless, is now the literary standard; of it complete grammatical treatises have been published, and into it portions of the Bible have been translated by Bishop Steere.[1]

SWALLOW (A.-S. *Swalewe*, Icel. *Svala*, Dutch *Zwaluw*, Germ. *Schwalbe*), the bird which of all others is recognized as the harbinger of summer in the northern hemisphere; for, though some slight differences, varying according to the meridian, are constantly presented by the birds which have their home in Europe, in northern Asia, and in North America respectively, it is difficult to allow to them a specific value; and consequently a zoologist of wide views,

[1] The language was first reduced to writing by the Arabs, who still use the Arabic character. But the European missionaries have wisely replaced this by the Roman system, which is far more suited for the transliteration of most African, and especially of the Bantu, tongues.

while not overlooking this local variation, will regard the Swallow of all these tracts as forming a single species, the *Hirundo rustica* of Linnæus.[1] Returning, usually already paired, to its summer haunts, after its winter-sojourn in southern lands, and generally reaching England about the first week in April, it at once repairs to its old quarters, nearly always around the abodes of men; and, about a month later, the site of the nest is chosen, resort being had in most cases to the very spot that has formerly served the same purpose—the old structure, if still remaining, being restored and refurnished. So trustful is the bird that it commonly establishes itself in any of men's works that will supply the necessary accommodation, and a shed, a barn, or any building with an open roof, a chimney[2] that affords a support for the nest, or even the room of an inhabited house—if chance should give free access thereto, —to say nothing of extraordinary positions, may be the place of its choice. Wheresoever placed, the nest is formed of small lumps of moist earth, which, carried to the spot in the bird's bill, are duly arranged and modelled, with the aid of short straws or slender sticks, into the required shape. This is generally that of a half-saucer, but it varies according to the exigencies of the site. The materials dry quickly into a hard crust, which is lined with soft feathers, and therein are laid from four to six white eggs, blotched and speckled with grey and orange-brown deepening into black. Two broods are usually reared in the season, and the young on leaving the nest soon make their way to some leafless bough, whence they try their powers of flight, at first accompanying their parents in short excursions on the wing, receiving from them the food themselves are as yet unable to capture, until able to shift for themselves. They collect in flocks, often of many hundreds, and finally leave the country about the end of August or early in September, to be followed, after a few weeks, by their progenitors. The Swallows of Europe doubtless pass into Africa far beyond the equator,[3] and those of Northern Asia, though many stop in India or Burmah, even further to the southward, occasionally reaching Australia, while those of North America extend their winter-wanderings to southern Brazil; but, whithersoever they then resort, they during that season moult their feathers, and this fact affords one of the strongest arguments against the popular belief (which, curious to say, is still partly if not fully entertained by many who should know better) of their becoming torpid in winter, for a state of torpidity would suspend all animal action.[4] The chestnut forehead and throat, the shining steel-blue upper plumage, and the dusky-white—in some cases reddening so as almost to vie with the frontal and gular patches—of the lower parts are well known to every person of observation, as is the markedly forked tail, which is become proverbial of this bird.

[1] Dr Stejneger (one of the chief leaders in the recent American movement, the results though not the intention of which would be the subversion of much of the nomenclature of birds hitherto thought in Europe to have been established on tolerably firm principles) would apply to the Swallow the generic term of *Chelidon*, generally accepted for the MARTIN (vol. xv. p. 581), and to the latter *Hirundo*. Herein he is technically incorrect, for one of the first principles of zoological nomenclature has always been that a generic term, to be valid, must be defined. In the absence of definition such a term may be, by courtesy, occasionally accepted; but this courtesy has never been, nor except in America is likely to be, extended to the misapplication here in question.

[2] Hence the common English name of "Chimney Swallow." In North America it is usually the "Barn-Swallow."

[3] It must be noted that the Swallow has been observed in England in every month of the year; but its presence from the beginning of December to the middle of March is an extremely rare occurrence.

[4] See John Hunter's *Essays and Observations in Natural History*, edited by Sir R. Owen in 1861 (ii. p. 280). An excellent bibliography of the Swallow-torpidity controversy, up to 1878, is given by Prof. Coues (*Birds of the Colorado Valley*, pp. 378–390), who seems still to hanker after the ancient faith in "hibernation."

Taking the word Swallow in a more extended sense, it is used for all the members of the Family *Hirundinidæ*,[5] excepting a few to which the name MARTIN (vol. xv. p. 581) has been applied, and this Family includes from 80 to 100 species, which have been placed in many different genera. The true Swallow has very many affines, some of which range almost as widely as itself does, while others seem to have curiously restricted limits; and much the same may be said of several of its more distant relatives. But altogether the Family forms one of the most circumscribed and therefore one of the most natural groups of *Oscines*, having no near allies; for, though in outward appearance and in some habits the Swallows bear a considerable resemblance to SWIFTS (*q.v.*), the latter belong to a very different Order, and are not Passerine birds at all, as their structure, both internal and external, proves. It has been sometimes stated that the *Hirundinidæ* have their nearest relations in the FLYCATCHERS (vol. ix. p. 351), but the assertion is very questionable, and the supposition that they are allied to the *Ampelidæ* (*cf.* WAXWING), though possibly better founded, has not as yet been confirmed by any anatomical investigation. An affinity to the Indian and Australian *Artamus* (the species of which genus are often known as Wood Swallows, or Swallow-Shrikes) has also been suggested; and it may turn out that this genus, with its neighbours, may be the direct and less modified descendants of a generalized type, whence the *Hirundinidæ* have diverged; but at present it would seem as if the suggestion originated only in the similarity of certain habits, such as swift flight and the capacity of uninterruptedly taking and swallowing insect-food on the wing.

Swallows are nearly cosmopolitan birds, inhabiting every considerable country except New Zealand, wherein only a stray example, presumably from Australia, occasionally occurs. (A. N.)

SWAMMERDAM, JOHN (1637-1680), may be ranked almost with Leeuwenhoek as one of the most eminent Dutch naturalists of the 17th century. Born at Amsterdam in 1637, the son of an apothecary and naturalist, he was destined for the church; but he insisted on passing over to the profession of medicine, meanwhile passionately devoting himself to the study of insects. Having necessarily to interest himself in human anatomy, he devoted much attention to the preservation and better demonstration of the various structures, and he devised the method of studying the circulatory system by means of injections, so doing the greatest service to practical anatomy. The fame of his collection soon became European; thus the grand-duke of Tuscany offered him 12,000 florins for his collection, on condition of his coming to Florence to continue it. His *General History of Insects* and other kindred works lie at the foundation of modern entomology, and include many important discoveries. Thus he cleared up the subject of the metamorphosis of insects, and in this and other ways laid the beginnings of their natural classification, while his researches on the anatomy of mayflies and bees were also of fundamental importance. His devotion to science led to his neglect of practice; his father greatly resented this, and stopped all supplies; and thus Swammerdam experienced a period of considerable privation, which had the most unfortunate consequences to his health, both bodily and mental. In 1675 he published his *History of the Ephemera*, and in the same year his father died, leaving him an adequate fortune, but the mischief was irreparable. He became a hypochondriac and mystic, joined the followers of Antoinette Bourignon, and died at Amsterdam in 1680.

SWAN (A.-S. *Swan* and *Swon*, Icel. *Svanr*, Dutch *Zwaan*, Germ. *Schwan*), a large swimming-bird, well known from being kept in a half-domesticated condition throughout many parts of Europe, whence it has been carried to

[5] An enormous amount of labour has been bestowed upon the *Hirundinidæ* by Mr Sharpe (*Cat. B. Br. Museum*, x. pp. 85–210), only commensurate, perhaps, with that required for an understanding of the results at which he has arrived. Nothing can better shew the difficulty of unravelling the many puzzles which the Family offers than this; and it is to be hoped that in his finely-illustrated *Monograph* which is now in course of publication he will succeed in clearing up some of them.

other countries In England it was far more abundant formerly than at present, the young, or Cygnets,[1] being highly esteemed for the table, and it was under especial enactments for its preservation, and regarded as a "Bird Royal" that no subject could possess without licence from the crown, the granting of which licence was accompanied by the condition that every bird in a "game" (to use the old legal term) of Swans should bear a distinguishing mark of ownership (*cygninota*) on the bill Originally this privilege was conferred on the larger freeholders only, but it was gradually extended, so that in the reign of Elizabeth upwards of 900 distinct Swan-marks, being those of private persons or corporations, were recognized by the royal Swanherd, whose jurisdiction extended over the whole kingdom It is impossible here to enter into further details on this subject, interesting as it is from various points of view [2] It is enough to remark that all the legal protection afforded to the Swan points out that it was not indigenous to the British Islands, and indeed it is stated (though on uncertain authority) to have been introduced to England in the reign of Richard Cœur de Lion, but it is now so perfectly naturalized that birds having the full power of flight remain in the country There is no evidence to shew that its numbers are ever increased by immigration from abroad, though it is known to breed as a wild bird not further from our shores than the extreme south of Sweden and possibly in Denmark, whence it may be traced, but with considerable vacuities, in a south-easterly direction to the valley of the Danube and the western part of Central Asia In Europe, however, no definite limits can be assigned for its natural range, since birds more or less reclaimed and at liberty consort with those that are truly wild, and either induce them to settle in localities beyond its boundary, or of themselves occupy such localities, so that no difference is observable between them and their untamed brethren From its breeding-grounds, whether they be in Turkestan, in south eastern Europe, or Scania, the Swan migrates southward towards winter, and at that season may be found in north-western India (though rarely), in Egypt, and on the shores of the Mediterranean

The Swan just spoken of is by some naturalists named the Mute or Tame Swan, to distinguish it from one to be presently mentioned, but it is the Swan simply of the English language and literature Scientifically it is usually known as *Cygnus olor* or *C mansuetus* It needs little description its large size, its spotless white plumage, its red bill, surmounted by a black knob (technically the "berry") larger in the male than in the female, its black legs and stately appearance on the water are familiar, either from figures innumerable or from direct observation, to almost every one When left to itself its nest is a large mass of aquatic plants, often piled to the height of a couple of feet and possibly some six feet in diameter In the midst of this is a hollow which contains the eggs, generally from five to nine in number, of a greyish-olive colour The period of incubation is between five and six weeks, and the young when hatched are clothed in sooty-grey down, which is succeeded by feathers of dark sooty-brown This suit is gradually replaced by white, but the young birds are more than a twelvemonth old before they lose all trace of colouring and become wholly white

It was, however, noticed by Plot (*N H Staffordshire*, p 228) 200 years and more ago that certain Swans on the Trent had white Cygnets, and it was subsequently observed of such birds that both parents and progeny had legs of a paler colour, while the young had not the "blue bill" of ordinary Swans at the same age that has in some parts of the country given them a name, besides offering a few other minor differences These being examined by Yarrell led him to announce (*Proc Zool Society*, 1838, p 19) the birds presenting them as forming a distinct species, *C immutabilis*, to which the English name of "Polish" Swan had already been attached by the London poulterers [3] There is no question so far as to the facts, the doubt exists as to their bearing in regard to the validity of the so called "species" Though apparently wild birds, answering fairly to the description, occasionally occur in hard winters in Britain and some parts of the European Continent,[4] their mother country has not yet been ascertained,—for the epithet "Polish" is but fanciful,—and most of the information respecting them is derived only from reclaimed examples, which are by no means common Those examined by Yarrell are said to have been distinctly smaller than common Swans, but those recognized of late years are as distinctly larger The matter requires much more investigation, and it may be remarked that occasionally Swans, so far as is known of the ordinary stock, will produce one or more Cygnets differing from the rest of the brood exactly in the characters which have been assigned to the so-called Polish Swans as specific—namely, their white plumage slightly tinged with buff, their pale legs, and flesh coloured bill It may be that here we have a case of far greater interest than the mere question of specific distinction,[5] in some degree analogous, but yet in an opposite direction, to that of the so-called *Pavo nigripennis* before mentioned (Peacock, vol xviii p 443)

Thus much having been said of the bird which is nowadays commonly called Swan, and of its allied form, we must turn to other species, and first to one that anciently must have been the exclusive bearer in England of the name This is the Whooper, Whistling, or Wild Swan[6] of modern usage, the *Cygnus musicus* or *C ferus* of most authors, which was doubtless always a winter-visitant to this country, and, though nearly as bulky and quite as purely white in its adult plumage, is at once recognizable from the species which has been half domesticated by its wholly different but equally graceful carriage, and its bill—which is black at the tip and lemon-yellow for a great part of its base This entirely distinct species is a native of Iceland, eastern Lapland, and northern Russia, whence it wanders southward in autumn, and the musical tones it utters (contrasting with the silence that has caused its relative to be often called the Mute Swan) have been celebrated from the time of Homer to our own Otherwise in a general way there is little difference between the habits of the two, and very closely allied to the Whooper is a much smaller species, with very well marked characteristics, known as Bewick's Swan, *C bewicki* This was first indicated as a variety of the last by Pallas, but its specific validity is now fully established Apart from size, it may be externally distinguished from the Whooper by the bill having only a small patch of yellow, which inclines to an orange rather than a lemon tint, while internally the difference of the vocal organs is well marked, and its cry, though melodious enough, is unlike It has a more easterly home in the north than the Whooper, but in winter not unfrequently occurs in Britain

Both the species last mentioned have their representatives in North America, and in each case the trans-Atlantic bird is considerably larger than that of the Old World The first is the Trumpeter-Swan, *C buccinator*, which has the bill wholly black, and the second the *C columbianus* or *americanus*[7]—greatly resem-

[1] Here, as in so many other cases, we have what may be called the "table name" of an animal derived from the Norman-French, while that which it bore when alive was of Teutonic origin

[2] At the present time the Queen and the Companies of Dyers and Vintners still maintain their Swans on the Thames, and a yearly expedition is made in the month of August to take up the young birds—thence called "Swan-upping" and corruptly "Swan-hopping"—and mark them The largest Swannery in England, indeed the only one worthy of the name, is that belonging to Lord Ilchester, on the water called the Fleet, lying inside the Chesil Bank on the coast of Dorset, where from 700 to double that number of birds may be kept—a stock doubtless too great for the area, but very small when compared with the numbers that used to be retained on various rivers in the country The Swanpit at Norwich seems to be the only place now existing for fattening the Cygnets for the table—an expensive process, but one fully appreciated by those who have tasted the results The English Swan-laws and regulations have been concisely but admirably treated by the late Serjeant Manning (*Penny Cyclopædia*, xxiii pp 271, 272), and the subject of Swan-marks, elucidated by unpublished materials in the British Museum and other libraries, is one of which a compendious account, from an antiquarian and historical point of view, would be very desirable

[3] M Gerbe, in his edition of Degland's *Ornithologie Européenne* (ii p 477), makes the amusing mistake of attributing this name to the "*fourreurs*" (furriers) of London, and of reading it "*Cygne du pôle*" (polar, and not Polish, Swan) !

[4] Chiefly in the north-west, but Lord Lilford has recorded (*Ibis*, 1860, p 351) his having met with them in Corfu and Epirus

[5] The most recent authorities on the Polish Swan are Stevenson, in separately-printed advance sheets (1874) of his *Birds of Norfolk* (vol iii), and Southwell (*Trans Norf & Norw Nat Society*, ii pp 258–260), as well, of course, as Dresser (*B Europe*, vi pp 429–433, pl 419, figs 1, 2)

[6] In some districts it is called by wild fowlers "Elk," which perhaps may be cognate with the Icelandic *Alft* and the Old German *Elbs* or *Elps* (*cf* Gesner, *Ornithologia*, pp 358, 359), though by modern Germans *Elb-schwan* seems to be used for the preceding species

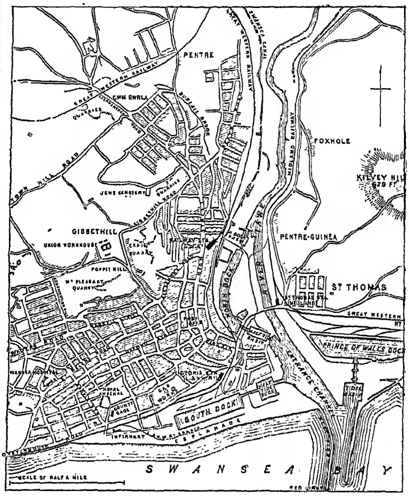
[7] Examples of both these species have been recorded as occurring in Britain, and there can be little doubt that the first has made its way hither Concerning the second more precise details are required.

bling Bewick's Swan, but with the coloured patches on the bill of less extent and deepening almost into scarlet. South America produces two very distinct birds commonly regarded as Swans,—the Black-necked Swan and that which is called *Cascaroba* or *Coscaroba*. This last, which inhabits the southern extremity of the continent to Chili and the Argentine territory, and visits the Falkland Islands, is the smallest species known,—pure white in colour except the tip of its primaries, but having a red bill and red feet.[1] The former, *C. melanocorypha* or *nigricollis*, if not discovered by earlier navigators, was observed by Narbrough 2d August 1670 in the Strait of Magellan, as announced in 1694 in the first edition of his *Voyage* (p. 52). It was subsequently found on the Falkland Islands during the French settlement there in 1764-65, as stated by Pernetty (*Voyage*, ed. 2, ii. pp. 26, 99), and was first technically described in 1782 by Molina (*Saggio sulla Stor. Nat. del Chile*, pp. 234, 344). Its range seems to be much the same as that of the Cascaroba, except that it comes further to the northward, to the coast of southern Brazil on the east, and perhaps into Bolivia on the west. It is a very handsome bird, of large size, with a bright red nasal knob, a black neck, and the rest of its plumage pure white. It has been introduced into Europe, and breeds freely in confinement.

A greater interest than attaches to the South-American birds last mentioned is that which invests the Black Swan of Australia. Considered for so many centuries to be an impossibility, the knowledge of its existence seems to have impressed (more perhaps than anything else) the popular mind with the notion of the extreme divergence—not to say the contrariety—of the organic products of that country. By a singular stroke of fortune we are able to name the precise day on which this unexpected discovery was made. The Dutch navigator Willem de Vlaming, visiting the west coast of Zuidland (Southland), sent two of his boats on the 6th of January 1697 to explore an estuary he had found. There their crews saw at first two and then more Black Swans, of which they caught four, taking two of them alive to Batavia; and Valentyn, who several years later recounted this voyage, gives in his work[2] a plate representing the ship, boats, and birds, at the mouth of what is now known from this circumstance as Swan River, the most important stream of the thriving colony of West Australia, which has adopted this very bird as its armorial symbol. Valentyn, however, was not the first to publish this interesting discovery. News of it soon reached Amsterdam, and the burgomaster of that city, Witsen by name, himself a fellow of the Royal Society, lost no time in communicating the chief facts ascertained, and among them the finding of the Black Swans, to Martin Lister, by whom they were laid before that society in October 1698, and printed in its *Philosophical Transactions* (xx. p. 361). Subsequent voyagers, Cook and others, found that the range of the species extended over the greater part of Australia, in many districts of which it was abundant. It has since rapidly decreased in numbers, and will most likely soon cease to exist as a wild bird, but its singular and ornamental appearance will probably preserve it as a modified captive in most civilized countries, and perhaps even now there are more Black Swans in a reclaimed condition in other lands than are at large in their mother-country. The species scarcely needs description: the sooty black of its general plumage is relieved by the snowy white of its flight-feathers and its coral-like bill banded with ivory.

The *Cygninæ* admittedly form a well-defined group of the Family *Anatidæ*, and there is now no doubt as to its limits, except in the case of the Cascaroba above mentioned. This bird would seem to be, as is so often found in members of the South-American fauna, a more generalized form, presenting several characteristics of the *Anatinæ*, while the rest, even its Black-necked compatriot and the almost wholly Black Swan of Australia, have a higher morphological rank. Excluding from consideration the little-known *C. davidi*, of the five or six[3] species of the Northern hemisphere four present the curious character, somewhat analogous to that found in certain CRANES (vol. vi. p. 546), of the penetration of the sternum by the trachea nearly to the posterior end of the keel, whence it returns forward and upward again to revert and enter the lungs; but in the two larger of these species, when adult, the loop of the trachea between the walls of the keel takes a vertical direction, while in the two smaller the bend is horizontal, thus affording an easy mode of recognizing the respective species of each.[4] Fossil remains of more than one species of Swan have been found. The most remarkable is *C. falconeri*, which was nearly a third larger than the Mute Swan, and was described from a Maltese cave by Prof. Parker in the Zoological *Transactions* (vi. pp. 119-124, pl. 30). (A. N.)

SWANSEA, a municipal and parliamentary borough and large seaport of Glamorganshire, South Wales, is finely situated in an angle between lofty hills, on the river Tawe,



Plan of Swansea.

near its mouth in the beautiful Swansea Bay, a recess of the Bristol Channel, and on the Great Western, London and North-Western, Midland, and Rhondda and Swansea Bay railway lines, 45 miles west-north-west of Cardiff. Being for the most part of comparatively modern growth, the streets are laid out with great regularity. Swansea retains few traces of antiquity, and some of its more picturesque features have been destroyed to make room for the construction of docks. Of the old castle,

[1] Dr Stejneger (*Proc. U. S. Nat. Museum*, 1882, pp. 177-179) has been at much pains to shew that this is no Swan at all, but merely a large Anatine form. Further research may prove that his views are well founded, and that this, with another very imperfectly known species, *C. davidi*, described by Swinhoe (*Proc. Zool. Society*, 1870, p. 430) from a single specimen in the Museum of Peking, should be removed from the Sub-Family *Cygninæ*. Of *C. coscoroba* Mr Gibson remarks (*Ibis*, 1880, pp. 36, 37) that its "note is a loud trumpet-call," and that it swims with "the neck curved and the wings raised after the true Swan model."

[2] Commonly quoted as *Oud en Nieuw Oost Indien* (Amsterdam, 1726). The incidents of the voyage are related in Deel iii. Hoofdst. iv. (which has for its title Description of Banda) pp. 68-71.

[3] The *C. unwini* doubtfully described by Mr Hume (*Ibis*, 1871, pp. 412, 413) from India, though recognized by Dr Stejneger (*ut supra*), seems to be only the immature of the Mute Swan.

[4] The correct scientific nomenclature of the Swans is a matter that offers many difficulties, but they are of a kind far too technical to have any interest for the general reader. Dr Stejneger, in his learned "Outlines of a Monograph" of the group (*ut supra*), has employed much research on the subject, with the result (which can only be deemed unhappy) of upsetting nearly all other views hitherto existing, and propounding some which few ornithologists outside of his adopted country are likely to accept, since the principles on which he has gone are not those commonly received, nor (it may perhaps be added) are based on common sense. In the text, as above written, care has been taken to use names which will cause little if any misunderstanding, and this probably is all that can be said in the present state of confusion.

originally founded in 1099 by Henry Beauchamp, earl of Warwick, to secure possession of his lands in the province of Gower, the principal remains are the keep, built by Bishop Gower of St David's after the castle had been for some time in ruins, a range of arched dungeons lit by loop-holes, and the hall, now fitted up for use as a volunteer drill hall. There are fragments of a wall with a Gothic window of the hospital of St David, founded by Bishop Gower in 1331. The church of St Mary's, founded by the same bishop, was rebuilt in 1739, with the exception of the tower and chancel. The modern public buildings include the guildhall, in the Italian style with Corinthian pillars and pilasters, erected in 1846, and comprehending the municipal offices, the crown and *nisi prius* courts, the council chamber, and the library of the Swansea and Neath Incorporated Law Society; the royal institution of South Wales, established 1835, a building in the Ionic style, and embracing a library, a lecture hall, and a museum of geology, mineralogy, natural history, and antiquities; the free public library, schools of art, and art gallery, a fine new building with about 30,000 volumes (including the library of the Rev. Rowland Williams, one of the authors of *Essays and Reviews*) and a large number of beautiful engravings; the grammar school, founded by Hugh Gore, bishop of Waterford, in 1682; the market (1830); the cattle market (1864); the Albert hall for concerts (1864), with a smaller hall erected in 1881; the agricultural hall; the working men's club (1875); the Prince of Wales hall (1882); and two theatres. The benevolent institutions include the general hospital, founded in 1817, and rebuilt with the addition of two wings in 1878; the Cambrian institution for the deaf and dumb, founded in 1847, and several times extended; the Swansea and South Wales institute for the blind (1865); the nursing institution (1853); the provident dispensary (1876); the eye hospital (1878); the industrial home (1859); and the sailors' home (1864). Swansea is specially well supplied with parks and recreation grounds. They include Brynmill grounds between Parkwern and Singleton (1872), 9 acres in extent, and containing a beautiful reservoir and ornamental lawns; Cwmdonkin park, on the uplands, 13 acres, and commanding fine views; the new recreation ground, formed in 1883, 11 acres, situated between Brynmill and the Oystermouth road; Park Llewelyn, to the north of Swansea, 40 acres; and the St Helen's Field, near the beach, about 20 acres, now being laid out. The population of the municipal borough (area 4363 acres) in 1871 was 51,702, and in 1881 it was 65,597. The population of the parliamentary borough in 1881 was 73,971. Its area then was 4777 acres, but in 1885, when Swansea received independent representation, the area was diminished, the population of this smaller area being 50,043 in 1881.

Swansea owes its prosperity to its situation in the neighbourhood of extensive collieries and to its possession of great natural advantages as a harbour. With some exaggeration it has been called the "metallurgical centre of the world," but the title must at least be allowed in reference to copper, which is imported to be smelted from all parts of the world. The smelting of copper, which has been carried on in the district from the time of Elizabeth, is the distinctive and most important industry of the town, the others including tinplate manufacture, lead smelting, spelter and zinc manufacture, the extraction and manufacture of silver, nickel, and cobalt, iron smelting, Siemens steel manufacture, the manufacture of chemicals, of agricultural manure, and of patent fuel, and the construction of railway carriages and waggons. In Swansea Bay there are valuable oyster fisheries. The earliest harbour works on a large scale were those of the South Dock Company, begun in 1847 and opened in 1859. This dock, which has an area of about 13 acres, with a half tide basin of 4 acres and a lock 300 feet long by 60 feet wide, is used principally for the export of coal. The north dock, completed in 1882, has an area of about 10½ acres, in addition to several other smaller docks. An important addition was made by the completion of the Prince of Wales Dock in October 1881, with an area of 23 acres, and as yet this additional accommodation is more than sufficient for the trade of the port. In 1876 the number of sailing and steam vessels that entered with cargoes and in ballast from foreign countries, British possessions, and coastwise was 7799, of 1,068,062 tons, the number that cleared being 7549, of 1,041,078 tons. In 1885 the entrances were 7447, of 1,461,248 tons, the clearances 7051, of 1,366,117 tons. The total average value of the imports of foreign and colonial produce during the five years ending 1885 was about £2,400,000, but has been decreasing, and the total average value of the exports of the produce of the United Kingdom was about £1,500,000, but has been steadily increasing, and has reached over £2,000,000. There is a large trade with France, Portugal, Spain, and the Mediterranean ports. There is also considerable trade with South Africa, and the trade is greater with South than with North America. The exports consist chiefly of the various manufactures of the town, especially tin plates, the direct trade in which between Swansea and American ports has within the last two years attained great importance; and the imports include chiefly metallic ores, timber, and various kind of provisions. Shipbuilding and ship-repairing are carried on, but the industry is of minor importance.

Swansea owes its origin to the erection of the castle in 1099 by Henry Beauchamp, earl of Warwick, who introduced into it a garrison of English and Flemish colonists. The fortress was frequently assaulted in the 12th and 13th centuries, and in 1260 was burned down by Llewelyn ab Grwfydd, last prince of North Wales. During the insurrection of Owen Glendower against Henry IV. it was again destroyed. Swansea was created a borough by a charter of King John, which is said to be preserved among the records of the Tower of London. The earliest charter in possession of the corporation is that granted by Henry III. in 1234, conferring upon it freedom from toll pontage and other customs. Its privileges were confirmed by Edward II. and Edward III. The town was during the Civil War alternately in the hands of both parties, but in 1647 the castle was dismantled by the Parliamentarians, after which Oliver Cromwell was made lord of Swansea, of the signiory of Gower, and of the manor of Kelvey. The corporation now consists of a mayor, 6 aldermen, and 18 councillors, and the borough has a commission of the peace. From the reign of Henry VIII. it contributed along with other boroughs to return a member to parliament. In 1658 it received a charter from Cromwell permitting it to return a member for itself, but after the Restoration it resumed its character as contributory. In 1832 it became the head of a new district of boroughs, and in 1885 it received separate representation, while a portion of its area was also included in a district of boroughs to which it gives the name. In the reign of Edward IV. the castle came by marriage to the Somerset family, and it is held by the duke of Beaufort, whose title of Baron Herbert of Gower dates from 1506.

SWARTZ, Olof (1760-1818), a celebrated Swedish botanist, was born in 1760. He commenced his botanical studies in Upsala, under Linnæus and Thunberg, and began early to make excursions. He made a voyage to America in 1783, visited England in 1788, returned to Sweden in 1789, and was made professor of natural history in Stockholm. He was the author of many systematic works, and largely extended our knowledge of both flowering plants and cryptogams. He died in 1818.

See Sachs, *Geschichte d. Botanik*.

SWATOW (also, less frequently, Swartow and Shantow), a port of China, in the province of Kwang-tung, opened to foreign trade in 1869. It is situated at the mouth of the main branch of the river Han, which 30 miles inland flows past the great city of Chow-chu or Tai-chu (Tie-chu), and the surrounding country is more populous and full of towns and villages than any other part of the province. English merchants settled on Double Island in the river as early as 1856; but the city, which is built on ground but recently recovered from the sea, was formerly a mere fishing village. The trade of the port has rapidly increased. In 1869 718 vessels of all nations entered or cleared (of 310,500 tons burden), in 1884 1387 vessels (1,282,936 tons)—the total value of the trade being respectively £4,800,000 and £5,519,772. The surrounding country is a great sugar cane district producing annually about 2,000,000 piculs (= 133⅓ lb) of sugar, and there is an extensive refinery in the town employing upwards of 600 workmen and possessing a reservoir for 7,000,000 gallons of water. Next in value comes the manufacture of bean cake, which is also imported in large quanti-

ties from New chwang, Chefoo, Shanghai, Amoy, and Hong-Kong (total import in 1874, 1,408,384 piculs, in 1884, 2,539,710) Among the leading exports are tea (since about 1872), grass-cloth, manufactured at Swatow from so-called Taiwan hemp (the fibre of the *Bœhmeria nivea* from Formosa), pine apple cloth, manufactured in the villages about Kieh-Yang (a town 22 miles distant), oranges, for which the district is famous, cheap fans, and pewter, iron, and tin wares Swatow is also a great emigration port In 1870 about 22,000 Chinese embarked there for Singapore, Bangkok and Saigon, and the number of emigrants has since increased so that British vessels alone carry 50,000 to 53,000 per annum Of the whole foreign trade of the port upwards of 83 per cent is in British bottoms, the trade with Hong-Kong being of especial importance The population of Swatow is upwards of 30,000 In 1874 the foreign residents numbered 147 (63 British), including Double Island

About 1865 the whole Swatow district was still divided into a number of "independent townships, each ruled by its own head-men," and the population was described in the official gazetteer as "generally rebellious and wicked in the highest degree" Mr Forrest, British consular agent, relates that in that year he was witness to the preparations for a fight between the people living on the opposite sides of the estuary, which was only prevented by an English war-vessel The Taipings swept over the country, and by their ravages and plundering did much to tame the independence of the clans The punishment inflicted in 1869 by Commander Jones on the inhabitants of Otingpui (Ou-ting-pei), about 8 miles from Swatow, for the attack they had made on the boats of H M S "Cockchafer," showed the Chinese authorities that such piratical villages were not so strong as had been supposed General Fang (a native of Chow chu fu) was sent to reduce the district to order, and he carried out his instructions with remorseless rigour

SWEAT See NUTRITION, vol xvii p 685

SWEATING-SICKNESS A remarkable form of disease, not known in England before, attracted attention at the very beginning of the reign of Henry VII It was known indeed a few days after the landing of Henry at Milford Haven on August 7, 1485, as there is clear evidence of its being spoken of before the battle of Bosworth on August 22 Soon after the arrival of Henry in London on August 28 it broke out in the capital, and caused great mortality Two lord mayors successively and six aldermen, beside numerous other persons, died in one week At the end of October, however, the epidemic in London suddenly ceased In Oxford it had already begun at the end of August, and lasted with great mortality for six weeks In the course of the autumn it attacked various places, and by the end of December had spread over all England Then the epidemic disappeared as suddenly as it came This alarming malady soon became known as the sweating-sickness It was regarded as being quite distinct from the plague, the pestilential fever, or other epidemics previously known, not only by the special symptom which gave it its name, but also by its extremely rapid and fatal course and by other characters to be noted presently

From 1485 nothing more was heard of it till 1507, when the second outbreak occurred, which was much less fatal than the first (it is said because the treatment was better understood) and attracted less notice In 1517 was a third and much more severe epidemic It began in London in July, and lasted till the middle of December Many distinguished persons died, including Lord Clinton, Lord Grey of Wilton, Andrea Ammonio, the king's secretary, and others, with an immense number of the common people In Oxford and Cambridge it was also very fatal, as well as in other towns, where in some cases half the population are said to have perished There is evidence of the disease having spread to Calais and Antwerp, but with these exceptions it was confined to England

In 1528 the disease recurred for the fourth time, and with great severity It first showed itself in London at the end of May, and speedily spread over the whole of England, though not into Scotland or Ireland In London the mortality was very great, the court was broken up, and Henry VIII left London, frequently changing his residence When the epidemic ceased cannot be accurately stated, nor have we any precise estimate of the mortality The most remarkable fact about this epidemic is that for the first and last time it spread over the Continent On the 25th July 1528 (English style) or 1529 (Roman style), when it was beginning to decline in London, it suddenly appeared at Hamburg The story went that the infection was brought by a ship returning from England, the sailors of which were suffering from the disease However this may have been, the disease spread rapidly, so that in a few weeks more than a thousand persons died In less than a week it had spread to Lubeck, and thus was the terrible sweating-sickness started on a destructive course, during which it caused fearful mortality throughout eastern Europe France, Italy, and the southern countries were spared It spread much in the same way as cholera, passing, in one direction, from north to south, arriving at Switzerland in December, in another northwards to Denmark, Sweden, and Norway, also eastwards to Lithuania, Poland, and Russia, and westwards to Flanders and Holland, unless indeed the epidemic, which declared itself simultaneously at Antwerp and Amsterdam on the morning of September 27, came from England direct In each place which it affected it prevailed for a short time only, —generally not more than a fortnight By the end of the year it had entirely disappeared, except in eastern Switzerland, where it lingered into the next year,[1] and the terrible "English sweat" has never appeared again, at least in the same form, on the Continent

England was, however, destined to suffer from one more outbreak of the disease, which occurred in 1551, and with regard to this we have the great advantage of an account by an eye-witness, John Kaye or Caius, the eminent physician It first appeared at Shrewsbury on April 13, and, after spreading to other towns in Wales and in the midland counties, broke out in London, causing in one week the death of seven hundred and sixty-one persons At the end of July it ceased in London, but it went through the east of England to the north, until the end of August, when it began to diminish At the end of September it ceased altogether, without affecting Scotland or Ireland Nor did it apparently widely affect the Continent, though Caius mentions its occurrence at Calais, and Brasavolus (*De Morbo Gallico*) speaks of the English sweating-sickness as raging in Flanders in the year 1551, in which he wrote, causing the death of several thousand persons, and lasting at least till September

Symptoms—The symptoms as described by Caius and others were as follows The disease began very suddenly with a sense of apprehension, followed by cold shivers (sometimes very violent), giddiness, headache, and severe pains in the neck, shoulders, and limbs, with great prostration,—in short, the usual symptoms of an acute febrile attack In some cases the stomach was affected, and there was vomiting, but according to Caius this happened only in those who were full of food The breathing was deep and frequent, the voice like a moan After the cold stage, which might last from half an hour to three hours, followed the stage of heat and sweating The characteristic sweat broke out suddenly, and, as it seemed to those unaccustomed to the disease, without any obvious cause In some cases it was much more copious than in others, these differences depending, according to Caius, mainly on age, clothing, food, and other external circumstances, and also on the season, sweating being more profuse in hot weather. With the sweat, or after that was poured out, came a sense of heat, and with this headache and delirium, rapid pulse, and intense thirst Palpitation and pain in the heart were frequent symptoms No

[1] Guggenbuhl, *Der englische Schweiss in der Schweiz*, Lichtensteig, 1838.

eruption of any kind on the skin was generally observed, Caius makes no allusion to such a symptom. In the later stages there was either general prostration and collapse, or an irresistible tendency to sleep, which was thought to be fatal if the patient were permitted to give way to it. The malady was remarkably rapid in its course, being sometimes fatal even in two or three hours, and some patients died in less than that time. More commonly it was protracted to a period of twelve to twenty-four hours, beyond which it rarely lasted. Those who survived for twenty-four hours were considered safe.

The disease, unlike the plague, was not especially fatal to the poor, but rather, as Caius affirms, attacked the richer sort and those who were free livers according to the custom of England in those days. "They which had this sweat sore with peril or death were either men of wealth, ease, or welfare, or of the poorer sort, such as were idle persons, good ale drinkers, and taverne haunters."

Relapses were not uncommon, but the statements sometimes made about the disease attacking the same person several times seem to rest on a misunderstanding of the original authorities. What is meant is that they had several, even twelve, successive attacks of sweating. The disease was not thought to be transmitted by contagion from one person to another. Nevertheless, in its spread, it appears, like cholera, to have followed the main lines of human travel and traffic,—passing with Richmond's army to Bosworth, thence to London, and so on. It would be difficult otherwise to explain why Calais should have been affected and not the adjacent parts of France. Even the very circumstantial story of the disease having been brought to Hamburg by a ship from England seems by no means incredible, though it is doubted by some.

Causes.—Some attributed the disease to the English climate, its moisture and its fogs, a view which was thought to be supported by the occurrence of unusual rainfall and atmospheric moisture in the years of the sweating sickness. But it is plain that the English climate was much the same before and after, and can hardly be regarded even as a predisposing cause, certainly not as an explanation. Nor is there much evidence that the epidemic years were distinguished for their humidity.

In 1485, 1507, and 1517 the seasons were in no way remarkable. The year 1528 (1529 in Continental reckoning) was, however, certainly notable for excessive moisture. In England eight weeks continuous rain began in April, and the harvest was spoiled. In Germany the copious rainfall, and the cold fogs which endured through the summer, gave the impression that the air of England had been carried over to the Continent. In 1551 the outbreak of the sickness in Shrewsbury is described as having been preceded by dense and stinking fogs, which arose from the valley of the Severn and spread over other parts of England. The summer was everywhere very hot, and in England moist as well. In Amsterdam a similar fog announced the outbreak of the sickness in 1528. But we cannot attribute much importance to these circumstances, since in other epidemics they were wanting, and similar conditions have often occurred without any pestilence resulting.

It was again attributed by some to the intemperate habits of the English people, and to the frightful want of cleanliness in their houses and surroundings which is noticed by Erasmus in a well-known passage, and about which Caius is equally explicit. But causes such as these cannot, any more than climate, account for the incidence in time of an epidemic, even if they do something towards explaining its geographical range. Nor is there much evidence that the English were worse in these respects than most European nations, though the native country of Erasmus may have set an early example of cleanliness.

Caius and some of the chroniclers make out that this special liability of Englishmen to the sweating-sickness followed them even into foreign parts, so that in Calais, Brabant, and Spain it affected the English only and not the natives. This is puzzling and improbable, except so far that the English abroad may have belonged to the same classes who mainly suffered at home. But a careful examination of those statements shows that they referred either to Englishmen who had left England while the disease was raging there and carried the infection with them, or to merchants and others who were in direct communication with home. This disease, like others introduced into a foreign country, did not always take root there. But it did so sometimes, as, according to contemporary evidence, was the case in Flanders in 1551. The statement also made that foreigners in England were not affected likewise requires qualification, since we know several instances of foreigners in London who died of it. On the whole, no great importance can be attached to this supposed special liability of the English physical constitution.

From all this we must conclude that climate, season, and manner of life were not adequate, either separately or collectively, to produce the disease, though each may have acted sometimes as a predisposing cause. The sweating-sickness was in fact, to use modern language, a specific infective disease, in the same sense as plague, typhus, scarlatina, or ague. The origin of such diseases is not explained by causes such as those above enumerated. We can only suppose that they come into being by laws similar to those which have determined the evolution of species of animals and plants. But when once their specific distinctness is established they "breed true" and always present the same characters.

Probable Identity with Miliary Fever.—The important question, however, arises—Did this specific disease exist before or has it existed after the sixty six years of its recognized history? or is it identical with any other known disease called by another name? It is very unlikely that any epidemic of so striking a disease should have existed before without having been noticed, and there is certainly no record since of any outbreak precisely similar. The only disease of modern times which bears any resemblance to the sweating sickness is that known as miliary fever ("Schweiss-friesel," "suette miliaire," or "the Picardy sweat"), a malady which has been repeatedly observed in France, Italy, and Southern Germany, but not in the United Kingdom. It is characterized by intense sweating, and occurs in limited epidemics, not lasting in each place more than a week or two (at least in an intense form). On the other hand, the attack lasts longer than the sweating-sickness did, is always accompanied by an eruption of vesicles, and is not usually fatal. It is therefore evidently not the same as the English disease, though allied to it. The first clearly described epidemic was in 1718 (though probably it existed before), and the last in 1861. Between these dates some one hundred and seventy five epidemics have been counted in France alone. A single epidemic of a disease which had a striking resemblance to the sweating-sickness was observed in 1802 at Röttingen, a village in the district of Würzburg, Germany. Its access was sudden, it affected chiefly robust persons, it was accompanied by profuse perspiration, rheumatic pains, &c., without any constant eruption. If death resulted it was usually in twenty four hours. The epidemic lasted some ten days, and then entirely vanished. It may be considered as an extremely severe form of miliary fever. Finally, Hirsch has drawn attention to certain cases of a choleraic affection, observed first by Dr Murray in India (1839-40), which has been described as a sweating sickness. It has, however, more resemblance to miliary fever than to the English sweat. A similar form of disease has been described by some French physicians as "choléra cutané ou sudoral." On a review of the whole evidence, it would appear that the only disease which the sweating sickness much resembled was the miliary fever, of which it may conceivably have been, like the Röttingen epidemic, a highly malignant form.

Where did it Originate?—Whether it really originated in England is a question difficult to answer. Its appearance certainly coincided with the arrival of a foreign army, consisting, as we know, largely of foreign mercenaries, men of foul habits and irregular lives (whom the French king was thought to have done his country a service by getting rid of), and crowded into small vessels. Among such men any infective disease which arose would, by want of cleanliness and overcrowding, be likely to be fostered into great intensity. It is in accordance with the history of many epidemics to suppose that an ordinary and not very fatal disease might under such circumstances assume a malignant form.[1] Now, supposing that the French soldiers brought with them their native "Picardy sweat," a malady local and not severe in its French home, might not this have become developed into the formidable English sweating-sickness? If so, its great destructiveness in England would also be in great measure explained by its affecting a new population. For we find that any exported epidemic disease is generally more fatal in a country which receives it for the first time, among a population which offers a virgin soil to the disease, than it was in the country where it was endemic, and where men were inured to the infection. The notable exemption of northern France from the true sweating-sickness would then have depended upon the population there being already inured to a milder form of the same disease. As to southern France and other countries of the south, they were evidently not adapted by climate to receive the infection. If this be true, we need hardly expect to see the sweating-sickness again. The sweat of Picardy may continue from time to time to produce its comparatively slight epidemics, but the conditions which launched the English sweat on its rapid career of destruction are unlikely to occur a second time. The example of the Röttingen epidemic, which on a small scale was scarcely less remarkable, may show, however, that such an event is not quite impossible.

Authorities.—For history see Bacon's *Life of Henry VII.*, and the chronicles of Grafton, Holinshed, Baker, Fabyan, &c. The only English medical account is that of John Caius, who wrote in English *A Boke or Counseill Against the Disease commonly called the Sweate, or Sweating Sicknesse* (London, 1552), and in Latin *De Ephemera Britannica* (Louvain, 1556, reprinted London, 1721). The English tract is reprinted in Babington's translation of Hecker's *Epidemics of the Middle Ages*, Syd. Soc., 1844. This also contains Hecker's valuable treatise on the English sweat, published in German, 1834, and also printed in his *Volkskrankheiten des Mittelalters*, edited by Hirsch, Berlin, 1865. Gruner's *Scriptores de Sudore Anglico*, Jena, 1847, contains nearly all the original documents, including the two treatises of Caius. See also Hirsch, *Handbook of Geographical and Historical Pathology*, transl. by Creighton, New Syd. Soc., 1885. (J. F. P.)

[1] This is the case even with the Oriental plague itself. See PLAGUE.

SWEDEN

Part I.—Geography and Statistics.

For map see vol. xvii. Plate XX.

SWEDEN comprises the eastern and southern divisions of the Scandinavian peninsula. Its northern extremity, Kuokimodka, is situated in 69° 3′ 21″ and the southern in 55° 20′ 18″ N. lat. The western extremity (on the Cattegat) lies in 11° 6′ 29″ and the eastern (on the frontier of Finland) in 24° 10′ E. long. The greatest length of the country from north to south is 986 miles and its greatest breadth 286 miles, and the area is 170,713 square miles. The length of the coast-line is 1603 miles, the length of the boundary line towards Norway 1019 miles, and that of the boundary line towards Finland 305 miles.

Sweden is divided into three chief parts,—the southern being called Gotaland, the middle part Svealand or Sweden proper, and the northern Norrland. The north and north-west parts of Norrland are called Lapland.

Mountain and river systems.

The frontier towards Norway, from 69° to 63° N. lat., is formed by a continuous mountain range called Kolen (the keel). The snow peaks of Sulitelma (6178 feet), east of Saltenfjord, on the frontier between Sweden and Norway, were long supposed to mark the highest elevation of this mountain chain, but the geodetical survey now in progress in western Lapland has already shown that there are at least two peaks whose height exceeds that of Sulitelma, viz., Kefnekaise (7008 feet) and Sarjektjåkko (6988 feet).

In this mountain range (Kolen), rise a great number of rivers and streams, which flow in a south-easterly direction to the Gulf of Bothnia. The immense quantity of fresh water that is thus carried into the gulf makes its water scarcely more salt than that of a lake (0.25 to 0.40 per cent. of salt). Between the upper courses of the rivers the watersheds consist of mountain ridges, which gradually diminish in height. The intermediate valleys are for the most part filled with the water of the rivers, and thus form a number of lakes at a considerable elevation above the sea-level. Issuing from these lakes, the rivers form great cataracts, and afterwards flow through the level plain that forms the coast-region of the Gulf of Bothnia for a distance of many miles from the shore.

The boundary between Sweden and Finland is formed by (1) Muonio Elf, and afterwards by (2) Torneå Elf, into which it flows; Torneå Elf rises in Torneå Trask, at an elevation of 1132 feet above the sea. Then come, in order along the coast, the following rivers:—(3) Kalix Elf, which in its upper course forms the lakes of Paitas Jaur and Kalas Jarvi,[1] (4) Stora Luleå Elf (242 miles), which forms Stora Luleå Jaur (1214 feet) and receives on the right (5) Lilla Luleå Elf, which forms the lakes of Saggat Trask and Skalka Jaur (984 feet), (6) Piteå Elf, with the lake of Tjaggelvas, (7) Skellefteå Elf, forming a number of great lakes, such as Hornafvan (1391 feet), Uddjaur (1375 feet), Storafvan (1371 feet), (8) Umeå Elf (261 miles), with a great number of lakes, of which the largest is Stor-Uman, receives on the left a tributary of almost equal size, viz., (9) Vindel Elf, (10) Ångerman Elf (211 miles), which receives the water of a whole system of streams and lakes, the largest of the latter being Stroms Vattudal, in the south of Lapland, (11) Indals Elf, which receives the Ammerå, with its tributaries and the numerous emissary lakes, as Hotagen (1017 feet), Kallsjon and Storsjon ("Storsa Lake" on the map) (958 feet, area 173 sq. miles). Close to the railway from Trondhjem to Ostersund, between Kallsjon and Storsjon, rises the peak of Åreskutan (4652 feet), which is ascended every year by a great number of tourists, and in the vicinity many sanatoria are situated. Farther south flow three large rivers:—(12) Ljungan (193 miles), with Holmsjon (656 feet), (13) Ljusnan (249 miles), and (14) Dal Elf (286 miles), which passes through Sarnasjon (1450 feet) and Siljan (541 feet, 110 sq. miles), and receives on the right (15) West Dal Elf. The last-named four rivers rise in a mountainous region with many high summits, which are the eastern outposts of the high range of Dovrefjeld, which traverses Norway from west to east, between the parallels of 67° and 63° N. lat. Among these summits, situated on the frontier or in Sweden, are to be observed the Syltoppar (5865 feet), Son Fjell (4190 feet), Helags Fjell (5900 feet), and Stadjan (3860 feet) on the north shore of Sarnasjon.

In Norway, not far from the sources of Dal Elf, lies the lake of Famundsjo, which gives rise to (16) Klar Elf, which flows southwards to Lake Vener, the largest lake in Sweden (144 feet, area 2150 square miles). The outlet of Vener is (17) Gota Elf, which falls into the Cattegat, near Gothenburg. The watershed between Dal Elf and Klar Elf is a wooded range of hills without high peaks, sloping to the south-east. The south-eastern part of Svealand comprises the water systems of the large lakes of Hjelmar (75 feet, area 185 square miles) and Malar (area 449 square miles). Lake Malar discharges into the Baltic at Stockholm by two outlets—(18) Norrstrom and Soderstrom. They are, however, almost to be regarded as channels or sounds, rather than as streams, the difference of level between Lake Malar and the Baltic being so small that occasionally, when the water is low in Malar and high in the Baltic, the current sets from the latter into the former. Lake Malar may thus be considered a fjord of the Baltic. Still its waters are kept fresh by the great number of small streams that discharge into it, the most important of these being (19) Fyris Elf, which passes Upsala.

The boundary between Svealand and Gotaland consists of wooded heights. Between Lake Vetter and the northern shore of Bråviken Bay stretches the forest of Kolmorden, and between the northern extremity of Lake Vetter and Lake Vener lies that of Tiveden. Lake Vetter (290 feet, area 733 square miles) discharges itself into Bråviken by (20) Motala Strom, the falls of which are utilized for the mills in the town of Norrkoping, near the mouth of the river.

The central part of Gotaland consists of an extensive tableland or plateau, of which the highest part, at an elevation of 1237 feet, lies somewhat to the south of Vetter. On the north this plateau descends rather abruptly towards the fertile plains of Ostergotland (drained by Motala Strom) and Skaraborg lan, between Vetter and Vener. Near the south-eastern shore of Vetter, a little to the north of Jonkoping, lies Mount Omberg (863 feet), and near the southern shore of Vener, close by Lidkoping, lies Kinnekulle (915 feet), both hills remarkable for their beauty. The great plateau descends less abruptly towards east, south, and west. A great number of lesser streams flow down its slopes. The principal are—(21) Emmån, which falls into Calmar Sound, (22) Lyckebyån, (23) Morrumsån, and (24) Helgaån, which flow in a southerly direction, and (25) Lagan, (26) Nissan, (27) Atran, and (28) Viskan, which fall into the Cattegat. On this great plateau and its slopes lie also many lakes. In the northern part, east of Vetter, lies Sommen (479 feet), and farther north Boren, Roxen, and Glan. Between

[1] The word for "lake," which is *sjo* or *trask* in Swedish, is *jaur* in Lappoman, and *jarvi* in Finnish. "River" is *elf* in Swedish.

Vetter and Vener lies Unden (384 feet). On the summit of the plateau lies Ekelsjo (1132 feet), and on its southern slope Helgasjo (535 feet), Bolmen (466 feet), Mockeln (446 feet), and Åsnen.

The southmost part of Sweden, Skåne, consists for the most part of a low fertile country. Only in the northern part, Christianstad lan, occur two low stretches of hills, called Linderodsåsen and Soderåsen.

Waterfalls. *Waterfalls*.—The largest waterfalls are—(1) Njuommelsaska (Harsprånget), in Stora Luleå Elf, with a breadth of 60–70 feet, consisting of two cataracts of 103 feet at the upper end and a fall of 150 feet more in the course of 1⅓ miles,—the largest waterfall in Europe; (2) Adna-Muorki-Kortje ("the great fall of the lake"), on the same river as the former, higher up, between the two lakes Jantajaur and Kaskajaur, has a fall of 130 feet, of which 100 feet are one perpendicular cataract; (3) Tannforsen, 12 miles west of Åreskutan in Jemtland, between Tannsjon and Noren, has a breadth of 160 and a perpendicular fall of 84 feet; (4) Trollhattan, in Gota Elf, consists of three successive falls having a total height of 100 feet.

Character of surface. It will be seen that, with the exception of the north-west part along the Norwegian frontier, Sweden is not a mountainous country. On the other hand, fertile plains are not frequent. The most extensive are the north-west shore of the Gulf of Bothnia, where, however, the severe climate precludes any successful agriculture, the water districts of Lake Malar and Lake Hjelmar, the rich agricultural district of Ostergotland between Vetter and the Baltic, Vestergotland, or the whole country between the two great lakes as far as Gothenburg, and, as has been just mentioned, the southmost part, or Skåne, which comprises Christianstad and Malmohus lan. The greatest part of the country consists of low hills of granite or gneiss, clothed with forests of pine and fir. The valleys are generally in great part filled with water, and the shores of their lakes or wide rivers are covered with forests of deciduous trees, chiefly birch, or consist of arable soil. With the exception of Finland there is no country so full of lakes as Sweden. Nearly one-twelfth of the whole surface of the country, or about 13,900 square miles, is covered with water.

Coast. *Coast*.—The coast of Sweden is not broken by so many or so deep fjords as that of Norway. The most considerable indentation is the above-mentioned Bråviken Bay. On the other hand, the Swedish coast is, perhaps in a still greater degree than the Norwegian, fringed by innumerable little islets. Except on the coast round Skåne, in the south, the mainland does not come into direct contact with the sea, girdled as it is by a belt of islands, holms, and skerries, more or less thickly set, which forms the

The "skargård". so called "skargård" fence of skerries or outer coast. Between this wall of islets and the mainland, therefore, extends a connected series of sounds of the greatest importance for coastal navigation, since they admit of the employment of vessels of less size and strength. This skargård forms, besides, a most valuable natural defence; for, while some sounds are deep, navigation in the vicinity of the coasts is, as a rule, practically impossible without the help of pilots.

The broadest part of this skargård is that off Stockholm, which stretches many miles out into the Baltic. It consists of a few large and well peopled islands, surrounded by many hundreds of islets, for the most part uninhabited. The outer islands are bare grey rocks of gneiss, but the inner ones are mostly covered with fir and birch trees. The entrance to Stockholm through this archipelago is of its kind one of the most curious and picturesque in the world. The largest of these islands are Ljustero, Vermdo, Ingaro, Vindo, Runmaro, Orno, and Uto (with rich iron mines). As mentioned above, Lake Malar is to be considered as a fjord of the Baltic. The skargård also extends into Malar, which is filled with islands. The most remarkable is Bjorko, where the old town of Birka was situated. The archæological researches on this spot have been of the greatest importance for our knowledge of life in Sweden in the times of the vikings. The part of the skargård next in breadth is that off Carlskrona, where the islands of Sturko, Tjurko, Aspo, and Hasslo are situated.

The Cattegat skargård, which extends from the fjord of Svinesund at the southern extremity of the Norwegian frontier as far as Halmstad, has a different aspect from that of the Baltic. In the Cattegat all the islands, as well as the rocks of the mainland, are almost bare of vegetation. Trees are quite absent in most places, and generally the grey rocks are not even covered with grass or moss. They look as if they were polished by the sea. Between these bare rocks there is, however, in many places even on the larger islands arable soil of great fertility. In the northern part of the skargård near Stromstad lie the larger islands of Sande, Odo, Tjerno, Roso, &c. Farther seawards lie the Koster Islands and the Vader Islands with their lighthouses. A little more to the south, in the vicinity of Lysekil, are three narrow fjords—Åbyfjord, Gullmarfjord, and Koljefjord. Off the first-named lies Malmo,[1] remarkable for its quarry, where the fine granite of which the island consists is wrought. Next come, in succession, Korno, Skafto, Flato, Hermano, and Lyro, the last two situated off the two largest islands on this coast, Oroust and Tjorn. All the islands now enumerated are surrounded by innumerable islets and rocks. South of Tjorn there are no considerable islands except Marstrand (with a small town and much frequented sea-bathing quarters), Koo, and Klofvero, all situated immediately to the south of Tjorn. On the coast of Halland we find only Saro, off the fjord of Kungsbacka, and the Vadero of Halland, off Torekow, between Laholm Bay and Skelder Bay, the only islands on the whole coast that are covered with a rich vegetation of trees. On the extreme point of the cape, between the latter fjord and the Sound, lies the isolated Mount Kullen with its lighthouse. In the Sound off Landskrona lies the islet of Hven, where Tycho Brahe had his observatory, Uranienborg, in the end of the 16th century (1576–1597).

In the Baltic lie the two great islands of Gotland and Oland, of which the former is itself a county and a bishopric. These islands are quite different from the Swedish mainland. They are formed of Silurian limestone. On the western coast of Gotland the limestone rocks descend precipitously into the sea, and the island forms a comparatively smooth plateau, which slopes gradually to the east. The limestone soil is very fertile, and trees and plants thrive on it that do not otherwise grow in the climate of Sweden, such as walnuts, ivy, &c. The case is the same in Oland. This island somewhat resembles a house-top. A sterile limestone plain (Alvaren) stretches the whole length of the island from north to south, and from this the country slopes both towards Calmar Sound on the west and towards the Baltic on the east. The slopes, especially the western, are very fertile. Large islands.

Sea-Bed.—The seas that surround Sweden are remarkably shallow. Round the south part of Norway runs a depression in the sea-bed, called the Norwegian Channel (see NORWEGIAN SEA). It stretches along the west and south coasts of Norway southward and eastward almost to Christiania Fjord and the Cattegat. The deepest part of this channel, upwards of 400 fathoms, extends through the Skagerack between Arendal in Norway and the Scaw. In the Cattegat the depth diminishes abruptly, and Depths of surrounding sea.

[1] Not to be confounded with the town of Malmo in Skåne.

between Gothenburg and the Scaw the greatest depth is between 33 and 55 fathoms The greatest part of the southern half of the Cattegat has a depth of less than 30 fathoms The depth of the Sound generally is even less than 12 fathoms The whole southern part of the Baltic between Sweden and Germany is very shallow. West of Bornholm the depth nowhere reaches 30 fathoms East of Bornholm the sea is somewhat deeper, and a small area of a depth of 50 to 60 fathoms is found a little east of that island The whole of that part of the Baltic which lies between Sweden and Russia is divided into two separate basins by a submarine bank From the southern extremity of Gotland (Hoburg) there extends a nearly uninterrupted bank to the south west as far as the Prussian coast The depth on this bank nowhere reaches 30 fathoms The shallowest parts are Hoburg Bank south of Gotland, Mittel Bank south east of Oland, and Stolpe Bank off the Prussian coast Between Fårö off the north coast of Gotland and the Gottska Sando there extends a similar bank, which continues with a somewhat greater depth of about 30 fathoms as far north as Stockholm The deepest part of the Baltic between these banks is situated in the north part between Landsort and the Gottska Sando, the maximum depth being about 160 fathoms Ålands Haf, the channel between the Swedish coast and the Åland Islands, is tolerably deep (100 to 160 fathoms)

The Gulf of Bothnia is divided into two basins by the channel of Qvarken, the southern is the deeper (about 50 fathoms), and the depth increases towards the north-west, where, over a small area off the island of Ulfo near the Swedish coast, it reaches 160 fathoms The channel of Qvarken is very shallow (8 to 16 fathoms) The basin on the north side is also shallow Only over a small area off Bjuro Cape does the depth exceed 160 fathoms

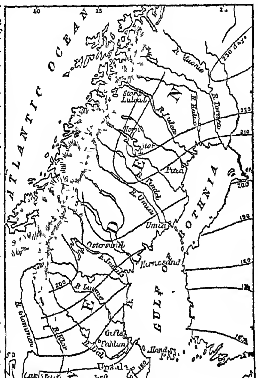
Climate *Climate* —Sweden is situated between two countries of very different climatological conditions On the west there is the maritime climate of the Norwegian coast, and on the east the continental climate of Russia It may be said that Sweden alternates between the two Cold winters alternate with mild ones, and warm and dry summers with cool and rainy ones But different parts of Sweden have also in this respect a greatly differing climate, of which we readily see the reason if we only recollect the character and the general features of the configuration of the country Lapland and the western part of the country along the Norwegian frontier have a pronounced continental climate, and so has the high plateau to the south of Lake Vetter On the other hand, the climate is more maritime the more we approach the coasts of the Baltic, and on the coast of the Cattegat and in Skåne the maritime climate distinctly predominates

Temperature The following table gives the mean annual temperatures (Fahr) at twenty eight meteorological stations in Sweden, together with the means for January and July —

Station	Annual	Jan	July	Station	Annual	Jan	July
	°	°	°		°	°	°
Lund	44.9	31.3	61.7	Orebro	41.6	25.8	62.6
Carlshamn	44.4	31.1	61.7	Stockholm	41.4	26.1	61.4
Calmar	44.2	30.2	62.1	Carlstad	41.6	24.9	62.9
Halmstad	44.8	30.5	62.7	Vesterås	41.0	24.7	62.6
Vexio	42.3	27.5	61.2	Upsala	40.4	24.5	61.5
Visby	43.4	30.7	60.3	Falun	38.7	20.8	61.2
Gothenburg	44.4	29.8	62.1	Gefle	40.0	24.5	61.0
Vestervik	42.8	28.1	61.4	Hernosand	37.1	20.0	58.9
Jönkoping	42.7	28.6	61.0	Ostersund	35.0	15.3	56.4
Venersborg	42.3	27.5	61.1	Umea	34.4	15.8	58.8
Skara	41.5	26.0	60.3	Stensele	31.7	9.5	57.7
Linkoping	43.4	27.8	63.9	Piteå	33.8	11.2	60.6
Nykoping	41.5	26.6	61.4	Haparanda	31.9	10.1	59.4
Askersund	41.0	25.1	61.2	Jockmock	29.1	3.1	58.0

From these figures it appears that, as mentioned above, the climate is most continental in the northern and interior parts of the country, especially at the two stations of Lapland, Stensele and Jockmock, while it is more maritime on the coasts For this reason the isotherms for January on the Scandinavian peninsula are linguiform The warm sea off Norway causes the peculiarity that the western parts of Lapland, although situated at the greatest elevation above the sea, have not so cold winters as the interior parts round the great lakes Still farther to the east the temperature increases again towards the coast of the Gulf of Bothnia. Thus, for example, the isotherm of 10° F enters Lapland from the north east at about 68° N lat, runs towards the south west over the great lakes as far as about $64\frac{1}{2}$°, south of Lake Stor-Uman, makes there an abrupt bend towards the east, and runs in a north easterly direction to Haparanda at the northern extremity of the Gulf of Bothnia The isotherm of 23° F runs from the great lake of Mjosen in Norway, north of Christiania, to the southern shore of Lake Siljan, or almost straight east, curves there to the north east, and reaches the shore of the Gulf of Bothnia a little north of the mouth of Ljusnan Finally, the isotherm of 30° runs from Gothenburg towards the south east to the lake of Åsnen, curves towards the north east, and passes Calmar and the northern parts of the islands Oland and Gotland On the summit of the plateau south of Vetter the mean temperature is of course lower than both north and south of the plateau In July the temperature is almost constant all over the country With the exception of the interior of Lapland the mean temperature varies generally between 59° and 62° The warmest point is Linkoping on the plain of Ostergotland, between Lake Vetter and the Baltic The most temperate and most agreeable climate of the whole country is that of the Cattegat coast round Halmstad

A good indication of the climate, especially that of the winter, is Equiglacial lines the time during which the freshwater lakes remain frozen We have seen that nearly one twelfth of the whole surface of Sweden is covered with water, and in Finland the number of the lakes is still greater In both countries the times of freezing and breaking up of a great many lakes have been observed for many years. From these data we can calculate the length of the ice periods If these periods are entered on a diagram, we can draw out the lines of equal ice periods, or the equiglacial lines The accompanying map shows these lines for Sweden and Finland From it we see that the glacial period in the southern part of the country is 90 days, while in the northern part of Lapland it has a duration of no less than 230 of the 365 days of the year The western lakes of Lapland, though the higher in situation, have a somewhat shorter ice period than the eastern The ice period is considerably lengthened on the great plateau south of Lake Vetter



Map of Equal Ice Periods

We have said above that in certain years the climate of Sweden Variations of temperature is more maritime, in others more continental Thus, for instance, the annual mean temperature of Upsala has varied during the last 30 years between 43° 2 (1859) and 35° 0 (1867) The mean temperature of particular months varies of course in a still higher degree, especially during the winter, thus the mean temperature of January 1873 was 34° 3, but of January 1875 only 12° 2

The difference between the means of the warmest month and the coldest is the so called yearly range of temperature In Sweden July is generally the warmest and February the coldest month The difference between the January and July temperatures, however, as given in the foregoing table, will show the yearly range approximately It will be seen that this increases towards the north For the same latitude, it is greater in the interior of the country than on the coasts

As is easily understood, the periodic daily range of temperature is least during the darkest part of the year, during December and January, especially in the north part of the country round the polar line, and still farther north, where it is almost nil The mean range for the whole country is in December only 2°. The

maximum occurs in June or July at all stations except those of western Sweden, where it occurs as early as May. The mean of June is 13°. A curious fact is that in Norrland, especially in the interior, a secondary maximum occurs in March, which sometimes even exceeds the summer maximum.

The non-periodic daily range of temperature, or the difference between the monthly means of daily maximum and minimum of temperature, is as usual considerably greater than the periodic. The difference is almost constant for all stations, especially during the warmer part of the year. We have, for the whole country—

	Non-periodic	Periodic	Difference
Winter	10°·0	3°·0	7°·0
Spring	16°·0	11°·2	4°·8
Summer	19°·1	13°·0	6°·1
Autumn	11°·7	6°·3	5°·4

Winds. The mean direction of the winds shows little variation during different seasons. During the summer it is west or west-south-west in the south of Sweden, changes to south-west in the middle part of the country, and due south along the coast of the Gulf of Bothnia. In winter north-north-east winds become comparatively frequent in the north part of the country. This is explained by the difference in barometric pressure in summer and in winter.

Barometer. In July the mean height of the barometer indicates a gradual fall along the coast of the Baltic, from 29·828 inches in Calmar to 29·675 in Haparanda. In January, on the other hand, there is a gradual fall from 29·853 in Calmar to 29·718 in Hernosand, but thereafter a gradual rise to 29·834 in Haparanda. Unfortunately the isobarometric lines for Sweden have not yet been calculated with due precision.

Rainfall. The rainfall is greatest on the coast of the Cattegat. The annual amount is greatest at Gothenburg, where it is 32·56 inches. At Halmstad it is 28·26, and at Venersborg, where Gota Elf issues from Lake Vener, it is 30·33. These are the rainiest stations of Sweden. Generally speaking, the amount of rain diminishes afterwards as well towards north and north-west as towards south-east. The least rain falls on the one hand in northern Lapland, where the annual amount is only 15·52 inches, and on the other hand in the south-eastern corner of Sweden, where (at Calmar) we have the lowest known rainfall for the whole country (12·75 inches). Between these two tracts there runs a belt of greater precipitation from Gothenburg towards the north-east to Upsala, where the annual amount is 23·28. Even along this belt the amount of rainfall diminishes towards the north-east, but at every point the amount is greater than to the north-west and south-east of it. The greatest amount of rain falls in July and August and the least in February and March. Thus, for instance, there fall in Upsala during August 2·86 inches and during March 0·99 inches. As the temperature varies, so does the rainfall for different years.

Thunderstorms. The number of thunderstorms is small in Sweden compared with the countries of the south. Their number diminishes as does the precipitation from south-west towards north and east. From 1871 to 1880 the mean annual number of thunderstorms at each station was 9·5 in Gotaland, 8·4 in Svealand, and only 6·3 in Norrland. In the south their number diminishes rapidly from west to east, from 11 on the coast of the Cattegat to 8·3 on the coast of the Baltic, and only 6·6 on the isle of Gotland. The thunderstorms have a distinctly marked annual and daily period. They occur almost always during the warmest time of the year and of the day. During the above-mentioned ten years the least number occurred during the month of February, only 3, whereas there occurred in May 1194, in June 3724, in July 4419, in August 3306, and in September 1461. As regards the daily period, the least number, 147, occurred between 1 and 2 A.M., and the greatest, 1704, between 3 and 4 P.M. In Gotaland and Svealand most of the thunderstorms come with a south-westerly wind, in Norrland with a southerly; for the whole country, the least number come with a northerly wind.

Hail. If the number of thunderstorms is small in Sweden, the same is in a still higher degree to be said of their intensity. Hail, which on the Continent causes such immense damage to the growing crops, is rare in Sweden, and often quite harmless. In the south of Germany about 2 per cent. of the crops are annually destroyed by hail. At Magdeburg the damage is 0·9 per cent., at Berlin 0·6 to 0·7 per cent., but in Sweden only 0·06 per cent. (H. H. H.)

Geology. *Geology.*—The fundamental rocks of Sweden belong to the Azoic or Pre-Cambrian formation, and consist of crystalline rocks. Three great divisions of this formation may be distinguished,—the grey gneiss, the red iron gneiss, and the granulite.

The grey gneiss rules in the northern and western parts of the country, from West Norrland down to the province of Calmar. The rock has a prevalent grey colour, and contains as characteristic minerals garnet and in some parts graphite.

The red iron gneiss prevails in western Sweden in the provinces of Vermland, Skaraborg, Elfsborg, and down to the province of Christianstad. The formation is very uniform in its character, the gneiss having a red colour and containing small granules of magnetite, but, nevertheless, not a single iron mine belongs to this region. The red gneiss contains in many places beds or masses of hyperite.

The granulite, also called eurite and halleflinta, is the most important of the Pre-Cambrian formation, as it contains all the metalliferous deposits of Sweden. It prevails in the middle part of the country, in the provinces of Vermland, Kopparberg, Vestmanland, and Upsala. It occurs also in some parts of the provinces of Ostergotland, Calmar, and Kronoberg. The main rock in this region consists of halleflinta, a kind of very compact and fine-grained mixture of feldspar, quartz, and mica, often graduating to mica schists, quartzite, and gneiss. With these rocks are often associated limestones, dolomites, and marbles containing serpentine (Kolmården). The metalliferous deposits have generally the form of beds or layers between the strata of granulite and limestones. They are often highly contorted and dislocated.

The iron mines occur imbedded in more or less fine-grained gneiss or granulite (Gellivaara, Grangesberg, Norberg, Striberg), or separated from the granulite by masses of augitic and amphibolous minerals (*gronskarn*), as in Persberg and Nordmark. Sometimes they are surrounded by halleflinta and limestone, as at Dannemora, Långban, Pajsberg, and then carry manganiferous minerals. Argentiferous galena occurs at Sala in limestone, surrounded by granulite, and at Guldsmedshytta (province of Orebro) in dark halleflinta. Copper pyrites occurs at Falun in mica-schists, surrounded by halleflinta. Zinc blende occurs in large masses at Ammeberg, near the northern end of Lake Vetter. The cobalt ore consists of cobalt glance (Tunaberg in the province of Sodermanland) and of linneite (at Gladhammar, near Vestervik). The nickel ore of Sweden is magnetic pyrites, containing only a very small percentage of nickel. The magnetic pyrites occurs generally imbedded in diorite and greenstones. In the evidently most recent division of the granulite occurs clay slate (at Grythytta in the province of Orebro).

Large masses of granite are found in many parts of Sweden, and form extensive massifs as in the provinces of Kronoberg, Orebro, Goteborg, Stockholm, &c. Sometimes the granite graduates into gneiss; sometimes (as north of Stockholm) it encloses large angular pieces of gneiss. In many parts of Sweden occur greenstones, as hyperite, gabbro (anorthite-gabbro at Rådmanso in the province of Stockholm), and diorite, the last often forming beds between the strata of the gneiss.

The Cambrian formation occurs generally associated with the Lower Silurian, and consists of many divisions. The oldest is a sandstone, in which are found traces of worms, impressions of *Medusæ*, and shells of *Lingula*. The upper divisions consist of bituminous limestones, clay slates, alum slate, and contain numerous species of trilobites of the genera *Paradoxides*, *Conocoryphe*, *Agnostus*, *Sphærophthalmus*, *Peltura*, &c. In Oland and north of Siljan are found beds with *Obolus*.

The Lower Silurian consists of the following divisions:—(1) beds with *Ceratopyge*; (2) schists with Graptolites; (3) large beds of red and grey limestone (200 feet in thickness) containing *Megalaspis* and *Orthoceratites*. This limestone is largely used as building material; (4) slates with *Trinucleus*; (5) slates with Brachiopods; (6) slates with Graptolites. The Cambrian and Lower Silurian strata occur scattered in several places from Vesterbotten down to Jemtland (around Storsjon), and in the provinces of Skaraborg, Elfsborg, Orebro, Ostergotland, and Christianstad. The whole of the island of Oland consists of these strata. The strata are in most places very little disturbed, and form horizontal or slightly inclined layers. They are, south of Lake Vener, capped by thick beds of eruptive diabase (called *trapp*). North of Lake Siljan (province of Kopparberg) occur Lower Silurian but not Cambrian strata, which have been very much dislocated. The Upper Silurian has in Sweden almost the same character as the Wenlock and Ludlow formation of England. The island of Gotland consists entirely of this formation, which occurs also in some parts of the province of Christianstad. In the western part of the province of Kopparberg are extensive deposits of sandstone, separated by beds of diabase, and seemingly of the same age,—the Middle Silurian,—but no fossils have been found in them. In the vicinity of this sandstone region are large beds and massiffs of porphyries. There are still two sets of stratified, not fossiliferous, deposits, viz., in the province of Elfsborg (formation of Dalsland) and around Lake Vetter (formation of Visingso). The Dalsland formation, which attains the thickness of 6000 to 7000 feet, consists of conglomerates, chlorite schists, quartzites, and mica schists. The Visingso formation, 800 to 1000 feet in thickness, consists of sandstones, clay-slate, &c. In the western and northern alpine part of Sweden, near the boundaries of Norway, the Silurian strata are covered by crystalline rocks, mica schists, quartzites, &c., of an enormous thickness. These rocks form the mass of the high mountain of Areskutan, &c.

The Triassic formation (Rhætic division) occurs in the northern

part of the province of Malmohus This formation consists partly of sandstones with impressions of plants (cycads, ferns, &c), and partly of clay beds with coal

The Cretaceous formation occurs in the provinces of Malmohus and Christianstad Also some spots of this formation are found in the province of Blekinge The Cretaceous beds of Sweden belong to the most recent division of the Cretaceous formation (chalk and danien) In many parts it has all the characteristics of a coast-deposit

The most recent deposits of Sweden date from the Glacial and Post-Glacial periods At the beginning of the Glacial period the height of Scandinavia above the level of the sea was greater than at present, Sweden being then connected with Denmark and Germany and also across the middle of the Baltic with Russia On the west the North Sea and Cattegat were also dry land On the elevated parts of this large continent glaciers were formed, which, proceeding downwards to the lower levels, gave origin to large streams and rivers, the abundant deposits of which formed the diluvial sand and the diluvial clay In most parts of Sweden these deposits were swept away when the ice advanced, but in Skåne they often form still, as in northern Germany, very thick beds At its maximum the inland ice not only covered Scandinavia but also passed over the present boundaries of Russia and Germany When the climate became less severe the ice slowly receded, leaving its moraines, called in Sweden *krosstenslera* and *krosstensgrus* Swedish geologists distinguish between *bottengrus* (bottom-gravel, bottom moraine) and ordinary *krossgrus* (terminal and side moraine) The former generally consists of a hard and compact mass of rounded, scratched, and sometimes polished stones firmly imbedded in a powder of crushed rock The latter is less compact and contains angular boulders, often of a considerable size, but no powder Of later origin than the krosstensgrus is the *rullstensgrus* (gravel of rolled stones), which often forms narrow ranges of hills, many miles in length, called *asar*, running generally, independent of the relief of the country, in a north-and-south direction or towards the south east They are of the same nature as the kames and eskers in Ireland and Scotland, and consist of rolled pebbles and sand It is very probable that these åsar were formed on the bottoms of rivers which cut their way in the inland ice During the disappearance of the great inland ice large masses of mud and sand were carried by the rivers and deposited in the sea These deposits, known as glacial sand and glacial clay, cover most parts of Sweden south of the provinces of Kopparberg and Vermland, the more elevated portions of the provinces of Elfsborg and Kronoberg excepted In the glacial clay shells of *Yoldia arctica* have been met with in many places (*e g*, near Stockholm) At this epoch the North Sea and the Baltic were connected along the line of Vener, Vetter, Hjelmar, and Malar On the other side the White Sea was connected by Lakes Onega and Ladoga with the Gulf of Finland and the Baltic In the depths of the Baltic and of Lakes Vener and Vetter there actually exist animals which belong to the arctic fauna and are remnants of the ancient ice-sea The glacial clay consists generally of thin darker and lighter coloured layers, which give it a striped appearance, for which reason it has often been called *hvarfvig lera* (striped clay) The glacial clay of the Silurian regions is generally rich in lime and is thus a marl of great fertility The deposits of glacial sand and clay are found in the southern part of Sweden at a height ranging from 70 to 150 feet above the level of the sea, but in the interior of the country at a height of 400 feet above the sea

On the coasts of the ancient ice sea, in which the glacial clay was deposited, there were heaped up masses of shells which belong to species still extant around Spitzbergen and Greenland Most renowned among these shell-deposits are the Kapellbackarne near Uddevalla With the melting of the great ice sheet the climate became milder, and the southern part of Sweden was covered with shrubs and plants now found only in the northern and alpine parts of the country (*Salix polaris, Dryas octopetala, Betula nana*, &c) The sea fauna also gradually changed, the arctic species migrating northward and being succeeded by the species existing on the coasts of Sweden The Post Glacial period now began Sands (*mosand*) and clays (*akerlera* and *fucuslera*) continued to be deposited on the lower parts of the country They are generally of insignificant thickness In the shallow lakes and enclosed bays of the sea there began to be formed and still is in course of formation a deposit known by the name *gyttja*, characterized by the diatomaceous shells it contains Sometimes the gyttja consists mainly of diatoms, and is then called *bergmjol* The gyttja of the lakes is generally covered over by peat of a later date In many of the lakes of Sweden there is still in progress the formation of an iron ore, called *sjomalm*, ferric hydroxide, deposited in forms resembling peas, coins, &c, and used for the manufacture of iron [1] (P T C)

[1] The geology of Sweden has been worked out principally by Hisinger, Forselles, Erdmann, Torneboehm, and others A systematic geological survey of Sweden was set on foot by the Government in 1858 The geology of the fossiliferous strata of Sweden has been elaborated chiefly by Nilsson, Angelin, Linnarsson, Lindstrom, Nathorst, and others, and that of the Glacial and Post Glacial periods by Sefstrom, Von Post, Torell, and others

Flora —Of the whole area of Sweden about 132,000 square miles are covered with wild vegetation This may be broadly divided into five different sorts, viz, the forest, bush, marsh, heath, and prairie vegetations, of which the first-mentioned covers by far the largest area, or upwards of 40 per cent of the whole surface of Sweden In the northern part of the country the fir (*Pinus sylvestris*) and the pine (*Pinus Abies*) are the predominating trees, south of Dal Elf the oak (*Quercus pedunculata*), and in the southern and south western provinces the beech (*Fagus sylvatica*), are, together with the fir and pine, the forest-forming trees Besides these, there are two species of birch (*Betula verrucosa* and *B odorata*), which form considerable forests The bush vegetation derives its character from various species of *Salix*, *Rubus*, and *Rosa*, from *Prunus spinosa* and several other species The marsh vegetation is composed of some low bushes, of *Cyperaceæ*, *Gramineæ*, and a small number of dicotyledonous and large flowered monocotyledonous plants The heath vegetation consists principally of social *Ericaceæ*, especially heather (*Calluna vulgaris*), and the prairie vegetation of a considerable variety of plants Flora

The Swedish phanerogamic flora is angiospermous, with about thrice as many dicotyledonous as monocotyledonous plants The gymnosperms are only about 0 25 per cent of the species of the flora Its largest families are (in the order of number of species) —*Compositæ, Gramineæ, Cyperaceæ, Cruciferæ, Papilionaceæ, Rosaceæ, Personatæ, Ranunculaceæ, Umbelliferæ, Alsinaceæ, Labiatæ*, and *Orchideæ*, the first named being represented by 160, the last named by 38 species The number of families represented amounts to 99 The largest genus of the flora is *Carex*, with 88 species More than 250 genera are represented by only one species each The whole number of phanerogamic species now known in Sweden is 1475 Of these only a very small number can be supposed to have originated in the country, the greatest number have immigrated from the south or east after the Glacial period, or have been introduced in one way or another by man Among the immigrated species about 400 are more or less generally spread over the polar countries of the present period, or are to be found in southern countries as alpine plants The great mass of these Glacial plants, the earliest inhabitants of the country, are confined to the northern part of Sweden, a smaller number are also to be found, or are only to be found, in the south and in particular localities, a larger number—about 70 species—are abundantly distributed over the whole country

The Glacial plants were followed and superseded partly by subarctic or subglacial species Of these the Swedish flora has about 300, of which 50 are abundantly spread over the country, and 80 are pretty generally and abundantly distributed The principal mass of the remaining species of the flora have immigrated in the same period as the oak, and have spread over the country south of Dal Elf, or also to the provinces immediately to the north of this river, some are outlying steppe plants, some have entered with the beech, the last immigrated forest tree of Sweden, and a small number of species, now limited to the west of the country, have possibly entered during a period before that of the beech, when the climate was warmer and moister than at present (F K)

Fauna —After the close of the Glacial period a twofold immigration of animals occurred,—from the south west through Denmark, and from the north east through Finland Of the existing fauna, many species are widely spread Especially in the north we find boreal circumpolar forms (wild reindeer, glutton, arctic fox, ptarmigan, several birds of prey, *Grallæ*, and aquatic birds) Others, such as the bear, the wolf, the fox, the magpie, &c, are to be found only in the Old World, but are represented in America by forms resembling them so much as to be regarded by many as only local varieties Many of the commonest species, *e g*, the squirrel, the woodpeckers, the crow, most of the singing birds, &c, though wanting in the New World, are distributed over Europe and parts of northern Asia Fauna.

Besides these we find also specially eastern, southern, and western forms, which have immigrated from widely separated regions Thus, the northern hare, *Lepus timidus*, properly an inhabitant of Russia and Siberia, but also to be found in the mountainous tracts of central Europe, is common in most parts of Sweden, while the European hare, *Lepus europæus*, which is spread over central and western Europe, and is also to be found in Denmark, is wanting Most of the field-mice, and many birds which have an exclusively eastern range, have immigrated from Siberia Among mammals, which nearly all belong to Europe, may be mentioned the roe deer and the red-deer, the dormouse and the hedgehog, the last-named is common in central and southern Sweden The elk is considered to have immigrated from the south

Not very long ago the bear, lynx, and wolf were common in all the forests of northern and central Sweden, but their number has rapidly decreased during the last fifty years The bear is now confined to the wildest mountain and forest regions of Norrland and Kopparberg lan The wolf was formerly common throughout the country, and between 500 and 600 were killed annually fifty

years ago. Now the number is only 30 to 40, and it is to be found almost exclusively in the mountain regions of Norrland. The lynx is also being exterminated; it is still found in the greater part of northern and central Sweden, at least as far south as Lake Vener. On the other hand, foxes have of late increased, at least in certain parts of the country, and are common everywhere. The glutton also is by no means rare in the mountain regions of Lapland. The destruction of cattle caused by beasts of prey, especially in the north, is not inconsiderable, the loss being estimated at about 2500 reindeer and from 9000 to 10,000 sheep and goats annually.

Not without influence on the number of the smaller beasts of prey are the singular migrations of the mountain LEMMING (*q.v.*), which has its home on the higher mountains above the tree limit, whence in certain years it migrates in countless numbers to the lower forest regions and lowlands, doing great damage to the vegetation wherever it goes. After the last migration in 1883 the number of the foxes was found to have increased in the regions through which the lemmings had passed.

Of eatable game the elk holds the first place. It has increased in numbers and range of late years, and is pretty common in the forest tracts of central Sweden. The roe deer, which has its proper home in the southmost parts of Sweden, has also increased of late, and has been seen as far north as Orebro lan and Vestmanland. Hares occur in great abundance. Seals are found round the coast; they are hunted chiefly in the Baltic and the Gulf of Bothnia. Besides the larger beasts of prey, martens, weasels, otters, and squirrels are hunted for the sake of their skins, but not to any great extent. The beaver is now probably extinct. Some of the mammals (the bat, hedgehog, dormouse, badger, bear) hibernate; most of the other animals are in winter covered with a thicker coat of hair, and some change their colour to white or grey.

The wood grouse is the most valued winged game. Its favourite haunt is the great lone forests. Although it has been obliged to retreat before advancing cultivation, it is still pretty common in suitable places. More numerous and almost as much liked is the black grouse, which has somewhat the same distribution as the wood-grouse, but is less particular in the choice of its abode. In the forests of central and especially of northern Sweden the hazel-grouse is numerous in many places, and on the mountains above the tree limit the ptarmigan is common everywhere. In the birch and willow regions we find the willow ptarmigan, which above the snow line is superseded by the common ptarmigan. In winter a great deal of game is exported from Norrland to the southern provinces. The partridge, probably introduced about 1500, with difficulty endures the rude climate of Sweden, and great numbers often perish in winter for want of food. Still it is distributed all over southern and central Sweden as far north as Jemtland, and of late its numbers have increased. The number of woodcock and snipe is, like that of *Grallæ* in general, decreasing. Numerous sea-fowl are found on all the coasts. Some are killed and eaten, but as a rule they are not much relished. Their eggs are collected for food by the inhabitants of the seaboard. The eider duck is common on both coasts. Among the birds of prey the hawk is the most destructive and the most hunted. The gyrfalcon and the golden eagle are found in Norrland and Lapland, and the sea-eagle throughout the country, especially on the coasts. Some kinds of falcons and owls are very common, the latter especially in northern Sweden. In the interior the most characteristic birds are swallows, sparrows, the birds of the crow family, and the singing-birds, among which the lark, the chaffinch, the thrushes, and the many species of *Sylvia* are most noticeable. The northern nightingale is rare in southern Sweden. The cuckoo is heard everywhere, especially in the forest regions. The mute swan is found in great numbers in a few places in southern and central Sweden. The whooper swan frequents the marshes and lakes of Lapland. The white stork is found in Skåne and Halland, and herons are found in great numbers here and there in Skåne and Blekinge. Cranes are distributed all over the country. Characteristic of the wild forest tracts of Lapland is the Siberian jay. Upwards of 250 species of birds may be considered as belonging to the Swedish fauna, most of them birds of passage, scarcely 40 remaining over winter in their summer resorts. In spring and autumn Sweden is visited by great flocks of the birds of passage of the extreme north, especially geese and snipe.

The reptiles and amphibians are few (3 snakes, 3 lizards, 11 batrachians).

Fisheries. The Swedish rivers and lakes are generally well stocked with fish. The objects of capture are chiefly salmon, eel, pike, different species of perch, burbot, and several species of the *Salmonidæ* and *Cyprinidæ*. The annual income from the fisheries in the lakes and rivers amounts to upwards of £135,800, of which the salmon fisheries alone yield £42,000. Of still greater importance, of course, are the sea-fisheries. In the end of last century the herring fishery in the "skargård" of the west coast was the most important in Europe, and it is estimated that in one year 1500 millions of herrings were taken. Somewhat later, however, the great shoals disappeared for a long time. In 1877 a new era began in the history of the west coast fisheries, the take that year being 1,230,000 cubic feet. Since then the herring has returned every year in greater or smaller numbers. There are also captured on the same coast flat-fishes and cod fish, mackerel, and sprats. The annual produce of the sea fishery of the south and west coasts is valued at about £111,000. A smaller variety of the herring is found in great abundance on the east coast. In the Sound it is still 11 inches in length, in the Baltic only 6 or 8 inches. This variety is called "strömming," and is the object of an important fishery, annually bringing in more than £175,000. About 140 kinds of fishes are constantly found in Sweden or along its coasts. Of these nearly 100 belong exclusively to the sea, and upwards of 10 are to be found both in salt and fresh water. The remainder are properly freshwater fishes, but many are found in the brackish water of the Baltic coasts. Here we find perch, pike, &c., by the side of purely saltwater fishes, as the "strömming," the flat-fish, &c.

The species of Scandinavian insects number at least 15,000. Notorious among these are the Lapland gnats. The "skargård" of the west coast has a rich fauna of lower marine animals, partly forms of boreal and arctic descent, partly immigrants from the south. The Royal Academy of Science has here a zoological station, Kristineberg, for the purpose of scientifically examining the marine fauna.

Compared with the fauna of the west coast, that of the Baltic is extremely poor. It consists partly of European boreal forms, which have immigrated from the west, partly of freshwater forms, which have been able to live in the brackish water. But other types also occur, which, though sparingly represented, are of the greatest interest to the naturalist,—namely, certain dwarfed forms,—two or three species of fishes, some crustaceans and other lower marine animals, belonging to a purely arctic fauna, which have immigrated when the Baltic during a part of the Glacial period communicated with the White Sea. They are wanting on the south and west coasts of Sweden, but are found in the Arctic Ocean. Some of them, the four horned cottus and some crustaceans, are found in Lake Vetter and some other lakes of central Sweden, whither they had come when these lakes formed part of the arctic sea; they have since been shut in and have survived both the climate and the altered composition of the water. The arctic "vikare" seal (*Phoca fœtida*), which is common in the north part of the Baltic but is not found on the west coast, and which is also found in Lake Ladoga, Lake Onega, and some lakes of Finland, is also considered as a survival of the fauna of the Glacial period. On the west coast lobster and oyster fisheries are carried on, the former being very productive. The common mussel is abundant, but in Sweden is only used as bait for fish. The crayfish is common in many places in central and southern Sweden. Pearls are sometimes found in the freshwater mussel *Margaritana margaritifera*, which is met with all over the country. (A. WI.)

Area and population. *Extent and Population.*—Sweden takes rank among the larger countries of Europe. It contains 170,712·60 English square miles, of which area 3,517·29 square miles are occupied by the large lakes Vener, Vetter, Malar, and Hjelmar, leaving 167,195·31 square miles, distributed among the counties as shown in the following table, which gives the areas and the estimated population in 1885 of the different administrative divisions (the capital Stockholm and the twenty four "lan" or counties) into which the kingdom is divided:—

Lan	Square Miles	Population
Stockholm (city)	12·65	215,688
Stockholm (rural)	3,008·45	148,841
Upsala	2,052·75	116,406
Sodermanland	2,630·64	150,032
Ostergotland	4,272·88	267,842
Jonkoping	4,440·51	197,392
Kronoberg	3,841·51	166,881
Calmar	4,439·06	240,507
Gotland	1,202·97	52,570
Blekinge	1,164·09	140,071
Christianstad	2,506·97	226,787
Malmohus	1,847·02	358,178
Halland	1,899·45	136,973
Goteborg (Gothenburg)	1,952·51	281,001
Elfsborg	4,948·15	282,335
Skaraborg	3,283·13	253,467
Vermland	7,345·73	259,958
Orebro	3,502·88	182,513
Vestmanland (Vesterås)	2,623·14	132,056
Kopparberg	11,420·8	194,291
Gefleborg	7,418·70	191,223
Vesternorrland	9,519·92	184,884
Jemtland	19,603·5	93,091
Vesterbotten	21,942·4	113,541
Norrbotten	40,315·5	96,241

The population has long been steadily increasing In 1750 it amounted to 1,763,368, in 1800 to 2,347,303, and in 1850 to 3,482,541 The census of December 31, 1880, returned the number as 4,565,668 (2,215,243 males, 2,350,425 females), and at the end of 1885 the population was estimated at 4,682,769 (2,273,861 males, 2,408,908 females)

It will be seen that Sweden is sparsely peopled (the average for the whole country being only 28 inhabitants to the square mile), and that the population is very unevenly distributed,—Malmohus län, which lies farthest south, counting 193 persons to the square mile, whereas Norrbotten, farthest to the north, and by far the largest county, has only 2 4

The urban population as late as 1884 amounted to only 777,857 (the rural amounting to 3,866,591) The towns are in general small Except Stockholm (215,688 inhabitants in 1885), only five towns—Gothenburg (91,033), Malmo (44,532), Norrkoping (28,503), Gefle (20,753), and Upsala (20,202)—had in 1885 more than 20,000 inhabitants

Vital statistics. The average number of marriages per 1000 inhabitants was for each of the years 1751–60 9 09, this proportion has gradually diminished since, having been 7 60 in 1851–60 and 6 81 in 1871–80 The yearly average of living children born from 1871–80 was 133,730, and the yearly average of deaths 80 140 The yearly average of deaths to 100 inhabitants for 1751–1815 was 2 71, this number has since been almost constantly decreasing, the average for 1851–60 being 2 17, and for 1871–80 1 82 Immigration and emigration till comparatively recent times had little influence on the numbers of population, but the latter years of the decennial period 1860–70 caused a change in this respect The number of emigrants, which as late as 1867 amounted to little more than 9000, increased during 1868 to 27,000 and during 1869 to 39,000 During the years that followed there was a considerable decrease, but towards 1880 the number of emigrants again rapidly increased, and in 1882 this amounted to upwards of 50,000 The figure for 1884 was 23,560 Immigration, on the contrary, continues to be insignificant The annual average of immigrants for 1875–84 was 3333

Race. The inhabitants of Sweden belong almost exclusively to the Scandinavian race The principal exceptions are the Finns (in 1880 about 17,000), who chiefly inhabit the north eastern part of the county of Norrbotten, the Lapps (in 1880 about 6400), spread over an area of about 44,000 square miles in Lapland and Jemtland, and the Jews (in 1880 about 3000)

Agriculture. *Agriculture* —Agriculture is the principal industry in Sweden The number of persons gaining their livelihood by this occupation and those immediately depending on it was 2,342,000 in 1880, and the value of the harvest in 1884 was estimated at about £25,500,000 sterling of which the grain-harvest made £14,800,000 From 1840 to 1880 the export of grain (including meal, &c) exceeded the import, but this has not been the case since 1881, while, on the other hand, the export of dairy produce has meanwhile increased

Mines. *Mines* —Sweden is rich in minerals, especially iron-ores, and the Swedish iron is celebrated for its good quality In 1884 526 iron mines were worked, the joint produce of which amounted to 922,810 tons The manufacture of cast iron amounted to 416,958 tons, that of bar iron to 267,534 tons, of steel to 66,329 tons, and of hardware to 43,226 tons The copper during the same year amounted to 650 tons, and the silver to rather more than 4000 lb Pit coal has been found only in Malmohus län, and even there in small quantity compared to the consumption of the country The produce of the coal mines was in 1884 not more than 7,277,000 cubic feet, whereas the import of coal amounted to 52,650,000 cubic feet

Forests. *Forests* —A great part of Sweden is, as was above mentioned, covered with forests Most of these are the property of private persons or joint-stock companies, but the Government also possesses large forests, the value of which was in 1884 estimated at about £2,400,000 The forest produce ranks among the principal articles of export from Sweden

Manufactures. *Manufactures* —It was not till 1854 that Sweden completely broke with the pre existing protectionist system and adopted the principles of free trade Since 1860 there has been no prohibition, and import duty is in general low The value of the manufactures, which as late as 1850 was estimated at only £2,000,000, was for 1883 computed at more than £10,600,000

Commerce. *Commerce* —The united value of the exports and imports of Sweden was estimated for 1850 at little more than £4,000,000, whereas in 1884 it was something over £31,000,000 (imports about £18,000,000, exports about £13,000,000) The principal articles of export were—timber and wooden wares, £5,747,000, metals and hardware goods, £2,667,000, grain (including meal, &c.), £1,307,000, animal food, £1,081,000, live animals, £652,000, paper and stationery, £584,000 The principal articles of import during the same year were—cotton and woollen manufactured goods, £3,012,000, colonial products (coffee, sugar, &c), £2,309,000, grain and meal, £2,258,000, minerals (principally coal), £1,479,000, metals and hardware goods, £1,308,000, cotton, wool, &c £1,125,000, animal food, £1,036,000, ships, carriages, machines, instruments, &c, £807,000, hair, hides, bones, horns, and other animal substances, £784 000, tallow, oils, tar, gums, and similar substances, £782,000 The aggregate burden of vessels entering from and clearing to foreign ports was 858,827 tons in 1850, 5,388,085 tons in 1884 The estimated value of the exports to the United Kingdom during 1884 was £6,229,000, to Denmark £1,848,000, to France £1,073,000, to Germany £1,008,000, and to Norway £604,000, while the imports from Great Britain and Ireland reached £4,952,000, from Germany £1,947,000, from Denmark £2,932,000, from Russia and Finland £1,881,000, and from Norway £1,225,000

Railways. *Railways, Posts, and Telegraphs* —The length of the railways in Sweden is very great in proportion to the population In 1884 the total length was 4194 miles, of which 1437 miles belonged to the Government and 2657 to 76 private companies The postal Post-Office. system is remarkably well organized In 1884 the number of post offices was 1965, through which 46,533,627 inland letters, post cards, post-office orders, newspaper and book packets, &c, were forwarded, and 5,507,770 to and 6,511,248 from foreign countries The telegraph system is also in a very flourishing condition The Telegraphs. total length of the telegraph wires in 1884 was 12,969 miles, and the number of messages forwarded was 1,178,959

Education. *Education* —With regard to education Sweden occupies a very prominent place Primary education is compulsory for all the children of the country, and this principle is so strictly applied that in 1884 out of 733,329 children of school age only 15,143 were not under tuition To supply this primary instruction there are 9925 national schools of different kinds, with 5216 male teachers and 6832 female teachers (1884) For higher educational purposes there are 96 public schools (1885), of three grades, with 14,617 pupils, and two universities (Upsala with 1821 and Lund with 827 students) In Stockholm there is, besides, a medical faculty, the Royal Caroline Medico-Chirurgical Institution A free university is in course of formation, for which large sums have been given by private persons There are a large number of Government schools for the military and naval services, for the technical sciences, for metallurgy, agriculture, nautical science, and for the blind and the deaf and dumb All instruction at the national schools, the public schools, and the universities is free

Religion. *Religion* —Christianity was introduced into Sweden about the ninth century, and was generally professed by the twelfth The country adopted the doctrines of the Reformation during the reign of Gustavus Vasa The national church, established by the resolution passed at Upsala in 1593 (*Upsala mote*), is Lutheran The country is divided into 12 bishoprics (*stift*) The bishop of Upsala is archbishop of Sweden In 1880 the number of dissenters was 21,234, of whom 14,027 were Baptists, 2993 Jews, 1591 Methodists, and 810 Roman Catholics

Army. *Army and Navy* —The land defences consist partly of a standing army, partly of a militia The former is for the most part founded on the so called "indelningsverk," an institution dating from the time of Sweden's greatness, which makes the soldier a settled farmer This force comprises about 40,000 men The militia comprises (since 1885) all males between twenty one and thirty two years of age The time of drill for the militia is only forty two days, extending over two years

Navy. The navy, with a permanent personnel (also for the most part founded on the "indelningsverk") of rather more than 7000 men, consists principally of coasting vessels, both ironclad and unarmoured

Constitution —Sweden is a limited monarchy. Its constitution, like that of England, rests on an historical development of several centuries From the earliest times the people governed themselves through elected trustees, made laws and levied taxes, while the king was little more than their leader in war By and by the power of the king was extended, and alongside of it there arose a class of great men, who certainly lessened the legal rights of the lower orders, but who never succeeded in completely subduing them Through Engelbrecht the burghers and yeomen regained their influence on the development of the state, and their deputies were summoned to the riksdag (1435) Gustavus Vasa and his son Charles IX stripped the nobility of the high authority they had exercised during the latter part of the mediæval period, and which had been dangerous both to the power of the king and to the people, and so saved the work of Engelbrecht The right of the lower classes to be members of the riksdag was confirmed by the first "Riksdagsordning" ("law for regulating the riksdag or parliament") of Sweden (1617),

which for the first time legally regulated the system of four houses formerly adopted. In the 16th century the nobility, having been endowed with extensive domains by the crown, again won an ascendency that was very dangerous to the lower classes, but it was crushed when Charles XI., by the diminution of their property (1680), for ever put an end to the supremacy of the nobility and the council in the state. By this act the power of the king was greatly strengthened, so much so as to endanger even the most essential rights of the riksdag,—those of giving laws and levying taxes. But after the death of Charles XII. the despotic system was abolished, and all power was lodged in the hands of the riksdag by the constitutions of 1719 and 1720. During the following period, which is called "the time of liberty," it was the riksdag that had the function of appointing and dismissing the councillors of state, and by this means was able to dominate the administration so completely as to make the power of the king of little more significance than an empty word. Different political parties defeated each other, and sold their services to foreign states without any regard to the interests of their own country. This state of affairs, which might eventually have proved exceedingly disastrous, was altered by a revolution effected by Gustavus III. (1772), which restored to the king his former power. In the new constitution, however, neither the authority of the king nor that of the people was clearly limited, and this soon led to collisions by which the king succeeded in considerably increasing his ascendency (1789), though he cannot be said to have gained despotic power. Gustavus IV., however, abused his great authority, so that he was dethroned by a revolution. New constitutional laws were now made, in which, guided by the experience of former times, an effort was made clearly to define the respective powers of the king and the representatives of the people, to prevent encroachment from either side. The effort was crowned with success, and the new constitution of June 6, 1809, is still in great measure in force. The old division, however, into four houses has been abolished, and the influence of the representatives of the people has been increased by the new Riksdagsordning of 1866. The other constitutional laws are the "Successionsordning" ("law of succession") of 1810 and the "Tryckfrihetsordning" ("law regulating the liberty of the press") of 1812.

The executive power is vested in the king alone. The legislative power he shares with the riksdag, both parties having the rights of initiative and veto. The king has, besides, a legislative power, not precisely defined, in certain economic matters. The right of levying taxes belongs to the riksdag alone, but the king may in certain cases (as, for example, through his right of lowering the custom duties) exercise a certain influence. He can declare war and make peace, and has the supreme command of the army.

The king is irresponsible, but all his resolutions must be taken in the presence of responsible councillors ("statsråd"). These, who form the council of state, are ten in number, of whom seven are also the heads of departments of the administration (justice, foreign affairs, army, navy, internal affairs, finance, and ecclesiastical affairs, including both church and schools). For the advice they give the councillors of state are responsible to the riksdag, which revises the record of their proceedings through an annually appointed board, which has power also to indict the councillors before a special tribunal, the "riksratt," formed for the occasion, of which certain high functionaries have to be members. One of the councillors of state is, as prime minister, the head of the administration.

The riksdag meets every year on January 15, and consists of two houses. The members of the first house, one for every 30,000 inhabitants (143 in 1887), are elected by the "landsting" in the counties, or by the municipal councils of the larger towns, for a period of nine years. They receive no payment. Any Swede is eligible who is at least thirty-five years of age, who possesses, and for three years before the election has possessed, real property to the value of 80,000 crowns, or who, during the same period, has paid taxes on an annual income of 4000 crowns. The members of the second house (one or two for every district of judicature in the country, according as the population exceeds or falls short of 40,000, and one for every 10,000 inhabitants in the towns) receive a salary of 1200 crowns, and are elected for a period of three years by electors, or directly, according to the resolution of the electoral district. If a member retires during that period, his successor is elected for the remainder of the three years, and thus the house is wholly renewed at regular intervals, which is not the case with the first house. The franchise is possessed by every one who owns landed property to the value of 1000 crowns, or who has farmed for at least five years lands worth 6000 crowns, or pays taxes on an annual income of 800 crowns. All electors are eligible. The number of electors is about 6.5 per cent. of the population. The towns elect their representatives separately. Both houses have in theory equal power. Before bills are discussed they are prepared by boards, whose members are elected by half of each house. When the houses differ on budget questions, the matter is settled by a common vote of both houses, which arrangement gives the second house a certain advantage from the greater number of its members. By revisers elected annually the riksdag controls the finances of the kingdom, and by an official ("justitieombudsman") elected in the same way the administration of justice is controlled; he can indict any functionary of the state who has abused his power. The bank of the kingdom is superintended by trustees elected by the riksdag, and in the same way the public debt is administered through an office ("Riksgäldskontoret"), the leader of which is appointed by the riksdag.

Administration, Law, and Justice.—The administration consists partly of a centralized civil service, arranged under different departments, partly of local authorities. Each of the twenty-four counties has a governor ("landshöfding") who presides over the local offices (the "landskansli," the "landskontor"), and is assisted by subordinate local officers ("kronofogdar," "häradsskrifvare," "länsman"). There is, moreover, in each county a representation (the "landsting"), elected by the people, that deliberates on the affairs of the county and has a right to levy taxes. Each county is divided into parishes, which, like the towns, have a very strong communal self-government. The law of Sweden dates from 1736, but it has of course undergone a great many alterations and additions, the most important being the new penal law of 1864. Justice is administered by tribunals of three instances:—(1) the "häradsrätter" in the country, consisting of a judge and seven to twelve assessors elected by the people, who, if they are unanimously of an opinion different from that of the judge, can outvote him, and the "rådhusrätter" (boards of magistrates) in the towns; (2) three "hofrätter" (higher courts) in Stockholm, Jönköping, and Christianstad; and (3) the royal supreme court, which passes sentence in the name of the king, and two members of which are present in the council of state when law questions are to be settled; this tribunal has, moreover, to give its opinion upon all proposed changes of the law. A jury is never summoned in Sweden except in cases affecting the liberty of the press.

Union with Norway.—Sweden has been united to Norway since 1814. The union is regulated by the "Riksakt"

of 1815, according to which each country is free and independent, though both are governed by the same king. The connexions of both countries with foreign states are regulated by the Swedish minister for foreign affairs, but when the king has to settle matters concerning foreign states which also are of importance to Norway a Norwegian councillor of state has to be present. Both countries have the same ambassadors and consuls abroad, and share the expenses of their support, Sweden bearing the larger part of this outlay. In war the two countries are bound to assist each other. Thus the union is what is called a "unio realis." (J. F. N.)

PART II.—HISTORY.

From the earliest times of which we have any authentic information there were in Sweden two more or less distinct peoples,—the Gota or Goths in the south, and the Svea or Swedes in the north. They spoke similar languages, were of the same Teutonic stock, and had like customs, institutions, and religious beliefs; but these facts did not prevent them from regarding one another with jealousy and dislike. The most powerful king among these peoples was the king at Upsala. There were other chiefs or kings, called in later times smaa-kongar, but they recognized the superiority of the Upsala king, whose peculiar position was due to the fact that there was at Upsala a great temple of Wodan, which was held in equal reverence by the Swedes and the Goths. Upsala was in the territory of the Swedes, and we can account for the feeling of the Goths with regard to it only by supposing that they were an offshoot from the Swedes, and that the worship of Wodan was in some special way associated with Upsala before the separation took place. Of the two peoples, the Goths seem to have been most active and open to new ideas. They spread along the southern coasts of Sweden and among the islands of the Baltic, and there can be little doubt that the Goths in Germany and Russia, who played so great a part in the disruption of the Roman empire, sprang from the Swedish Goths.

Slavery was not unknown in ancient Sweden, but it did not form an important element in social life. The vast majority of the people were free. They were divided into two classes, jarls and bondar, corresponding to the Anglo-Saxon eorls and ceorls. The bondar were the landed freemen, while the jarls were of noble blood. In some remote age the land may have been held in common by village communities, but in historic times there has always been in Sweden private property in land as well as in movables,—the jarls having wider lands than the bondar, and some bondar being better off than other members of their class. The kings were treated with much respect, for they belonged to families which were believed to be descended from the gods; but their power was far from being absolute. When a king died, his authority did not necessarily pass to one of his sons; the freemen chose as his successor the member of the royal family who seemed to them best fitted for the duties of the office. The king's power was limited not only by the fact that he was elected but by the rights of the freemen in all matters concerning life and land. At regular times moots were held for legal, legislative, and political purposes; and without the sanction of the Great Thing, as the tribal assembly was called, no law was valid and no judgment good.

Besides the Great Thing, of which all freemen were members, there were local things, each attended by the freemen of the district to which it belonged. The chief function of these local assemblies was to settle disputes between freemen, their decisions being given in accordance with rules based on ancient customs. Very often their judgments could not be enforced; and here, as in other Teutonic lands, the impotence of the local popular courts was one of the causes which led to the growth of the king's authority. He was bound to go round his land in regular progress, doing and enforcing justice among his subjects; and in course of time men felt more and more strongly that the best way of obtaining redress for serious grievances was to appeal directly to him.

As far back as we can go in Swedish history we find that the principal aim of the Upsala kings was to get rid of the smaa-kongar, and to put royal officers in their place. These officers ruled in the king's name in association with the local things, but their tendency, especially in times of great civil commotion, was to make themselves as independent as possible. The king himself was always attended by some of the leading magnates, who formed a sort of council of state, and with their aid he prepared the plans which were afterwards submitted to the Great Thing. Although the Great Thing never ceased to be in theory an assembly of the nation, it gradually lost its primitive character, the political rights of the common freemen being usurped by the nobles, who sought also to hamper the exercise of the royal authority.

According to the *Ynglinga Saga*, in which bits of old Swedish legends are preserved, the first Upsala kings were Ynglingar, sprung from Yngve Frey, the grandson of Wodan. We are told that the last representative of this dynasty was Ingjald Illrede, that he slew six of the smaa-kongar, and that he afterwards killed himself when he heard that the son of one of the murdered chiefs was advancing against him. It is said that the Ynglingar were succeeded by the Skioldungar, who claimed to be descended from Skiold, Wodan's son; and the traditional account is that this line began with Ivar Widfadme, and that he not only became king at Upsala but conquered Denmark, a part of Saxony, and the fifth part of England. Another of the Skioldungar, Eric Edmundsson, is said to have been an even greater king than the founder of the dynasty. During this legendary period, kings in Sweden were often at war with kings in Norway and Denmark, and Swedish adventurers undertook many warlike enterprises against the Finns and the Wends. While Danes and Norwegians were founding states in the British Islands and France, the Swedes were accomplishing like results on the eastern shores of the Baltic.

At this early period Sweden did not take in all the territory which now belongs to it. Scania, one of the most fruitful and prosperous districts of modern Sweden, had been from time immemorial an independent and comparatively powerful Gothic state. In the 9th century it was annexed to Denmark by King Guthrun; and, although in later times it was often a subject of bitter dispute between Denmark and Sweden, its connexion with the former country was not finally severed until the 17th century. Lund, the principal town in Scania, was for many generations the see of the primate of the Danish church.

The scattered notices of Adam of Bremen, Saxo, and certain saints' lives, with a few allusions elsewhere, are our direct written sources for this early period. They may be eked out by study of the laws and of local nomenclature. Later the rich runic remains of Sweden give us some fuller help. After the end of the 10th century the evidence gradually becomes clearer and more trustworthy. There was then at Upsala a powerful king called Eric the Victory-Blest. He defeated a band of vikings in a great battle at Fyrisval, and, according to Adam of Bremen, had for some time complete control over Denmark. He was succeeded in 993 by his son Olaf Olaf.

(993–1024), who was called the Lap-King because he was a child when his reign began. Olaf was baptized about the year 1000, and was the first Christian king of the Swedes. In the 9th century St Ansgar had laboured for some time as a missionary in Sweden, but without much success. Even Olaf, who was supported in his efforts by Siegfred, the devoted English missionary from whom he had received instruction in Christian doctrine, found that it was impossible to convert the majority of his subjects. He was allowed to build churches in West Gothland, but in the rest of his dominions the people clung obstinately to paganism. During his reign there was war between Sweden and Norway, and Olaf seems to have been in favour of carrying on the struggle with vigour. His people, however, desired peace, and it is related that at the Great Thing at Upsala they threatened to take his life if he did not give Olaf, the Norwegian king, his daughter in marriage. He consented to do as they wished, but broke his promise; and he would probably have been set aside had it not been for the mutual jealousy of the Swedes and the Goths.

The Lap-King was succeeded, one after the other, by his sons Anund and Edmund the Elder; and under their rule the church lost much of the ground which it had gained through the efforts of Olaf. After Edmund the Elder's death the Goths resolved that Stenkil, the Christian jarl of West Gothland, should be made king. This decision was resisted by the Swedes, but the result of the civil war which broke out was that Stenkil was able to maintain his claim. He reigned from 1056 to 1066, and effectually protected the church without attempting to do violence to the convictions of the pagan population. His reign was followed by a period of much confusion, during which the Goths and the Swedes treated each other as enemies,—the latter upholding paganism, the former contending for Christianity. Under Inge the Elder, who reigned from 1080 to 1112, the temple at Upsala was burned, and from this time there could be no doubt as to the ultimate triumph of the church, which was served with heroic courage by many zealous foreign missionaries. So much progress was made that Swerker Karlsson, who reigned from about 1135 to 1155, begged the pope to give the Swedish people bishops and a primate. Nicholas Breakspear, the English cardinal who was afterwards raised to the papacy as Adrian IV., was sent to make the necessary arrangements. He found that the Swedes and the Goths could not agree as to a place for the see of a primate; but at a synod which met at Linkoping in 1152 it was decided that the Swedish clergy should accept the law of celibacy, and that Sweden should pay a yearly tax to the pope. For a long time many pagan ideas and customs survived, but Sweden was now, at least nominally, a Christian country.

Eric Edwardsson

When Swerker was murdered in 1155 the Goths wished to make his son king, but the Swedes chose Eric Edwardsson, and he reigned until 1160. Eric was so good a king that after his death he was canonized by the popular voice, as was then the way in the North. Upsala was made by him a primate's see, and he began the series of efforts which led to the annexation of Finland to Sweden. Finnish pirates had often desolated the Swedish coasts, and it had become absolutely necessary that their country should be subdued. Eric not only overcame the Finns, but did what he could to compel them to accept Christianity.

For about a century after Eric's death the Goths and the Swedes were almost constantly at war with one another, each people choosing its own king. The Goths preferred the descendants of Swerker, while the Swedes were loyal to the descendants of Eric, who were known as the yeomen-kings, because Eric had originally belonged to the class of bondar or yeomen. The Danish kings often aided one or other of the contending parties, and as a rule they seem to have done far more harm than good by their interference. To some extent the church maintained among the people a sense of national unity, but it was not powerful enough to give much protection to the poorer members of the community against the despotism of local magnates. In the end, when the church itself became rich, the higher clergy were quite as tyrannical as the secular nobles.

John Swerkerson, the last king of the Swerker dynasty, died in 1222; Eric the Halt, the last of the yeomen-kings, in 1250. In the latter year the crown was given to Waldemar, whose mother was a sister of King Eric the Halt. Waldemar belonged to the Folkungar family, which had acquired great estates and risen to a position of high importance in the state. Under this dynasty the Goths and the Swedes gradually ceased to be jealous of one another, and became a thoroughly united people. From this time civil troubles in Sweden sprang, not from the antagonism of rival peoples, but chiefly from the increasing power of the great landowners, who strove incessantly to limit the rights of the free peasantry, and were often strong enough to defy the crown.

Waldemar

At the time of the death of Eric the Halt, Birger Brosa, Waldemar's father, was in Finland, where he conquered Tavastland and strengthened the hold of the Swedish crown over those tribes which had been already subdued. On his return to Sweden he was indignant to find that he had not himself been elected to the throne. He accepted what had been done, however, and devoted his energies to the promotion of his son's interests. Until his death Birger was the real ruler of Sweden, and the nation had never been governed by a man of stronger will or more upright character. If he did not actually found Stockholm, it was he who made it the strongest fortress in the country,—a service for which the Swedish people had good reason to be grateful to him, for it enabled them to put an end to the depredations of Finnish pirates. After the death of Birger great evils were brought upon the country by the folly and incompetence of Waldemar, who was at last driven from the throne and imprisoned by his brother Magnus, who succeeded him. Magnus (1279–1290) was a lover of pomp and splendour, and formed a more brilliant court than the Swedes had ever seen. He granted immunity from taxation to those landowners who should give the crown *ross-tjenst* or horse-service, that is, serve the king in war at the head of a body of horsemen. His intention in adopting this plan was to secure for the crown a powerful body of loyal and attached supporters, but, as the measure added to the wealth, dignity, and influence of the nobles, its ultimate effect was to weaken the royal authority. Although he increased the importance of the aristocracy, Magnus was not unmindful of the interests of the common freemen. He is known as Ladu-laas or Barn-Lock, because he issued a law requiring persons of noble birth to pay for the straw and corn with which, when travelling, they might be supplied by peasants. Magnus was also a munificent benefactor of the clergy. He endowed a large number of churches and built five monasteries.

Magnus

Birger

Magnus was succeeded by his son Birger (1290–1319). Birger was only nine years old when his father died, and for a long time the power of the crown was wielded by his guardian, Torkel Knutsson, a wise and vigorous statesman. Knutsson drew up a code of laws which was accepted by the Great Thing in 1295; and in Finland he not only put down rebellion but annexed Savolax and Carelia. In 1306, misled by his brothers Eric and Waldemar, Birger

caused this faithful and able counsellor to be beheaded, and the result was civil war, in which the weak king found it hard to make way against his restless and ambitious brothers. At last he got them into his power by treachery, and threw them into a dungeon of the castle of Nykoping, where they died of starvation. Soon afterwards Birger himself died, despised and hated by his subjects. He was succeeded by his nephew Magnus, his brother Eric's son, a child of about three years of age. Magnus's guardian, Mats Ketilmundsson, was a man of strong and noble character, and as long as his supremacy lasted the Swedish people were more prosperous than they had ever been before. Taking advantage of the troubled condition of Denmark, he joined Scania and the neighbouring districts of Halland and Blekinge to the Swedish kingdom, and had his prudent system of government been maintained these provinces might have been kept, for the inhabitants seem to have preferred Swedish to Danish rule. But, when he died in 1336, the king fell under the influence of unworthy favourites. Scania, Halland, and Blekinge were restored to Denmark, and Sweden was soon in a state of the greatest confusion. In 1363 a number of nobles who had given Magnus much trouble, and whom he had expelled from the country, went to his sister's son Albert, count of Mecklenburg, and offered him the crown. The offer was accepted, and afterwards Albert was formally elected by the Great Thing. Magnus resisted, but was defeated and made prisoner in a battle at Enkoping in 1365. In 1371 he was released, and the rest of his days he spent in Norway, where he was not unpopular. From his mother he had inherited the Norwegian crown, but before the misfortunes of his later years it had been transferred to his son Haco.

Magnus.

Albert.

The nobles and the hierarchy of Sweden were now so powerful that only a king of the highest political genius could have hoped to control them. Albert of Mecklenburg proved to be utterly unfit for the task he had undertaken. He tried to protect himself by giving many of the great offices of state to Germans, but he was warned that he would be dethroned if he continued to show so much favour to foreigners. In 1371 he accepted as his chief counsellor a great Swedish noble called Bo Jonsson, to whom about a third of the kingdom is said to have belonged. Bo Jonsson gave much more heed to his own interests than to those of his country, and did hardly anything to mitigate the hardships inflicted on the common people at this time by the turbulence of the well-off classes. After Bo Jonsson's death Albert attempted to regain some of the authority which he had been forced to delegate to his powerful minister, but the nobles refused to obey him, and invited Margaret of Denmark and Norway to take his place.

Margaret.

Margaret, one of the most remarkable figures in Scandinavian history, was the daughter of Waldemar IV of Denmark, and at an early age she had become the wife of Haco of Norway, son of the Swedish king whom Albert had supplanted. The offspring of this marriage was an only son, Olaf, who succeeded his grandfather in Denmark in 1375 and his father in Norway in 1380. Both countries were ruled firmly and wisely by Margaret in her son's name, and after his death in 1387 the Danes and the Norwegians begged her to retain supreme power. To this request she assented, and, when the Swedish nobles asked her to undertake the government of Sweden also, she at once expressed her willingness to attack Albert, who had irritated her by claiming the Danish crown. An army was soon despatched to Sweden, and in 1389 Albert was defeated and taken prisoner at Falkoping. Stockholm, which was held by German mercenaries, refused to admit the conqueror, and for several years it was besieged without success by Danish troops. At last the difficulty had to be settled by negotiation. In 1395 it was arranged that Albert should be set at liberty on condition that within three years he should pay a ransom of 60,000 marks. If at the end of that period the money was not paid, he was either to give up Stockholm or to return to captivity. The result was that in 1398 Stockholm was surrendered by the Hanseatic League, which had become security for the fulfilment of Albert's engagement.

Meanwhile Margaret had persuaded the Danes, the Norwegians, and the Swedes to accept her grandnephew Eric of Pomerania as her successor, and in 1397 he was crowned at Calmar. Margaret was eager that the union of the Scandinavian countries under a single sovereign should be made permanent, and delegates from the councils of state of the three kingdoms met at Calmar to discuss her proposals. On the 20th of July 1397 these delegates concluded what was called the union of Calmar. Sweden, Norway, and Denmark, while retaining their local laws and customs, were in all future time to be ruled by one king. When a king died he was to be succeeded by his eldest son, but if he were childless his successor was to be freely elected. In foreign affairs Scandinavia was always to act as a united country. Margaret had excellent intentions in devising this bold scheme, but the time was not ripe for so vast a change. It was inevitable that when popular movements were no longer held in check by her strong will, formidable difficulties should spring from the jealousies of the three nationalities.

Even after Eric's coronation Margaret remained the real sovereign, and she was powerful enough to make the union something more than a mere name. But even during her lifetime the Swedish people showed that they resented the idea of being taxed for objects in which they were only indirectly interested, and when she died (in 1412) it soon became evident that Eric would be unable to retain their allegiance. In 1386 Margaret had formally recognized the claim of Gerhard VI, count of Holstein, to be feudal lord of the duchy of Schleswig. Gerhard died in 1404, leaving three young sons. Margaret and Eric then tried to recover the rights of the Danish crown in the duchy, and in 1413, soon after Margaret's death, Eric caused Schleswig to be declared a forfeited fief. The result was a war which lasted about twenty years. The Swedes had to bear heavy burdens to enable Eric to carry on the conflict, and he made no attempt to allay their discontent. He seldom visited their country, and his officers often treated them with reckless cruelty. In the province of Dalecarlia the royal bailiff acted so tyrannically that in 1434 the people rebelled. They were led by a brave and patriotic miner, Engelbrecht Engelbrechtsson, and under his influence the movement spread rapidly among the peasantry of other districts. The Swedish council of state, alarmed by the enthusiasm he had excited, agreed in 1436 to declare the king deposed. The nobles were more afraid of the peasants than of Eric, and soon placed him on the throne again, but he never fully recovered his authority. He was obliged to make Charles Knutsson his viceroy in Sweden, and Knutsson was as anxious as Engelbrechtsson that Swedish independence should be restored. The two patriotic leaders became jealous of one another, and Engelbrechtsson was murdered by a member of Knutsson's party. But the popular agitation lost none of its original force, and in 1439 Eric was dethroned by all his kingdoms. He fled to the island of Gotland, where he lived for some years by piracy, and afterwards he was compelled to seek for refuge in Pomerania.

Eric XIII.

Christopher of Bavaria, Eric's nephew, was elected to the Danish throne, and he was soon acknowledged also in

Christopher.

Norway and Sweden He was a man of good intentions, but was not strong enough to overcome the prejudice created against him by the fact of his being a foreigner When he died in 1448 the Danes chose Christian, count of Oldenburg, as his successor, and the Norwegians by and by followed their example Had the decision in Sweden rested only with the nobles and the clergy, Christian would at once have received the Swedish crown, for under the nominal rule of a foreign king these classes were able to tyrannize as they pleased over their poorer neighbours But the Swedish people generally so strongly disliked the union, and stood so urgently in need of the protection of a native sovereign, that Charles Knutsson was made king He mounted the throne as Charles VIII The aristocracy, both spiritual and temporal, detested him, and in 1457 he found in Archbishop Jons Bengtsson so formidable an enemy that he had to make his escape to Dantzic Christian I of Denmark and Norway then became king of Sweden, but he was unable to assert supremacy over the country as a whole, and in 1464 Charles VIII again secured the throne In the following year Charles was displaced a second time, but soon afterwards he was recalled, and he retained the crown until his death in 1470

Charles VIII

Sten Sture regent

Charles was succeeded, not as king but as regent, by his nephew Sten Sture, under whose firm rule Sweden became prosperous and contented Sten Sture was a far-seeing statesman, and sided resolutely with the peasants against the nobles He took great pains also to promote the intellectual culture of the people The university of Upsala was founded by him, and he introduced into Sweden the art of printing, and invited to the country many foreign scholars He was not able wholly to destroy the union, for in 1496 he was defeated by King Hans of Denmark and Norway, who afterwards received the Swedish crown Nevertheless Sten Sture remained the real master of Sweden, and after the defeat of the Danes by the Ditmarshers in 1500 his power was almost absolute He died in 1503, when his authority passed to his nephew Svante Nilsson Sture, whom King Hans and the Swedish clergy and nobles in vain attempted to put down Svante Nilsson Sture was succeeded by his son, Sten Sture the younger, in 1512, and for some time this brave and patriotic regent vigorously held his own both against his enemies at home and against Christian II, king of Denmark and Norway In 1520, however, he was mortally wounded in a battle with the Danes at Bogesund, after which Christian II became king of Sweden This sovereign had some enlightened ideas, but he was a man of ferocious passions, and he had no sooner restored the union than he made the maintenance of it impossible by an act of almost unparalleled cruelty Under the pretence of upholding the honour of the church he ordered at Stockholm the execution of ninety persons accused of having taken part in the deposition of his friend and supporter Archbishop Gustavus Trolle, who had been the late regent's bitterest enemy Most of the condemned men were nobles, and Christian hoped that by killing them he would secure the allegiance of the peasantry The whole Swedish nation, however, was shocked by so horrible a massacre, and resolved to shake off for ever the hated Danish yoke

Christian II

The movement for national independence was headed by Gustavus Ericsson, known afterwards as Gustavus Vasa This young noble had been one of a group of Swedish hostages whom Christian II had sent to Denmark, treating them as if they had been prisoners of war In 1519 he escaped from prison, and after a short stay in Lubeck found his way to Dalecarlia, where he went about in disguise among the peasantry, urging them to combine against the common enemy At first they were afraid to act with him, but their hesitation vanished when they heard of the blood-bath in Stockholm,—a crime by which Gustavus himself was more than ever embittered against the Danes, for his father was one of Christian II's victims A force raised by Archbishop Trolle having been defeated, Gustavus led his troops beyond the limits of Dalecarlia and took Vesterås and Upsala, and laid siege to Stockholm and Calmar These fortresses were bravely defended, but in 1523, with the help of a fleet sent to him by Lubeck, he succeeded in capturing them In 1521 he had been declared regent, and in 1523, before the conquest of Stockholm and Calmar, he summoned at Strengnas a diet which elected him to the throne Soon afterwards he made himself master of Finland, and he annexed Scania, Halland, and Blekinge The union had now been brought to an end, and from this time Sweden was always ruled by her own kings Denmark and Norway, however, remained subject to one crown until the beginning of the 19th century

Gustavus Vasa

Gustavus Vasa was by far the greatest sovereign who had up to this time ruled the Swedish people Before he was made king the doctrines of Luther had been proclaimed in Sweden by the brothers Olaus and Laurentius Petri, and Gustavus, who listened attentively to their teaching, became one of the most enthusiastic adherents of the Reformation He acted cautiously, however, and resolutely opposed violent agitators The majority of the Swedes cordially accepted the new doctrines, and at a diet held at Westerås in 1527 Gustavus received authority to reorganize the church This he did thoroughly, making it clear from the beginning that Protestant pastors would never be permitted to wield the power which the Roman priesthood had so often abused The greater part of the vast estates which had belonged to the Roman clergy he confiscated and applied to the uses of the state In his secular policy he was as bold and successful as in his dealings with the church For centuries the independence and arrogance of the great nobles had been the curse of the Swedish people Gustavus missed no opportunity of limiting their influence He compelled them to bear their fair share of the public burdens, and secured for himself faithful allies by obtaining for burghers and the peasantry, who had lost almost all their political influence, a recognized place in the diet, which was now summoned more frequently and regularly than it had been for several generations Gustavus did everything he could to encourage industry For six years he fought with Lubeck in order to break the supremacy of the Hanseatic League, and he concluded treaties of commerce with England and the Netherlands So many changes were effected in Sweden in his time that several conspiracies were formed against him, but he had little difficulty in overcoming his enemies, for he had the confidence and affection of the great mass of his subjects In 1544 it was decided by the diet that the Swedish throne should cease to be elective, and that it should be hereditary in the family of Gustavus

Eric XIV

When Gustavus died in 1560, his eldest son Eric became king Eric was foolish enough to go to war with Frederick II of Denmark for no better reason than that the latter, like Eric himself, claimed the right to put three crowns in his coat-of-arms This war, which lasted seven years, caused much suffering to both nations The Danes were generally beaten at sea, but under the leadership of the stout soldier Daniel Rantzau they gained important victories on land Intellectually Eric was one of the most cultivated of Swedish kings, but in action he was so headstrong and wayward that most people believed him to be insane He wasted the treasure amassed by

his father, and under the influence of passion and suspicion caused the death of many powerful and loyal subjects. In 1568 his brothers John and Charles rebelled against him. His favourite, Goran Persson, who was accused of having constantly misled him, was seized and executed, and Eric himself was obliged to surrender. He was deprived of the crown and kept in close confinement until 1577, when he was murdered.

John III. John mounted the throne as John III. (1568–1592). In 1570 the war between Sweden and Denmark was brought to an end by the peace of Stettin. Sweden obtained some advantages by this treaty, but she had to resign to Denmark her claims to the island of Gotland, and to Scania, Halland, and Blekinge. Through the influence of his first wife Catherine, sister of King Sigismund II. of Poland, John had become a Catholic; and as king he laboured to restore as far as possible the old religious forms. His efforts were bitterly resented by the Protestants, while at Rome he was condemned for not acting with sufficient decision in the interest of his church.

Sigismund. He was succeeded by his son Sigismund, who had been elected king of Poland in 1587. In the interval between John's death and Sigismund's arrival in Sweden supreme power was exercised by Duke Charles, Sigismund's uncle. Charles, the ablest of all the sons of Gustavus Vasa, resolved to take advantage of the opportunity to place the ecclesiastical system of the country on a satisfactory basis. Accordingly a great assembly was summoned at Upsala in 1593, and by this assembly it was decreed that the Augsburg confession of faith should be accepted as the authoritative statement of the theological doctrines of the Swedish church. The decision was of vast importance, and the Swedes have ever since looked back upon it as one that marked an era in their national history.

Before his coronation in 1594 Sigismund undertook to protect the rights of his Protestant subjects; but, being an ardent Catholic, he soon began to work for the triumph of his own creed. On his return to Poland the discontent he had excited in Sweden found free expression, and he was obliged to place the administration of affairs in the hands of his uncle, Duke Charles. In the time of King John a dispute about frontiers had led to war between Sweden and Russia, and this war was still going on when Charles undertook his new duties. In 1595 he concluded peace, securing for Sweden the provinces of Esthonia and Narva, but yielding to Russia some districts on the borders of Finland. These districts were held by Klas Fleming, an enthusiastic adherent of King Sigismund, and he declined to give them up, nor were they surrendered until the death of this general in 1597. Meanwhile Charles had found that some members of the council of state were bent on thwarting all his schemes, and from them he appealed to the diet. The diet heartily supported him, and appointed him governor-general of Sweden; whereupon he set to work in earnest to put down Catholic intriguers, and to promote the interests of the peasantry in opposition to those of the great nobles. In 1598 Sigismund advanced against him with a Polish army, and was defeated at Stangebro, near Linkoping. The war went on for some time, but Sigismund himself returned to Poland. In 1600 the diet demanded that he should reside in Sweden or send his son to be educated as a Protestant. No answer being returned to these demands, Sigismund was dethroned, and his heirs were deprived of

Charles IX. the right of succession. Duke Charles was then made king, and reigned as Charles IX. Sigismund continued to regard himself as the lawful sovereign, and as the same pretension was made by his descendants, a very bitter feeling sprang up between Sweden and Poland,—a feeling which led to many wars during the next sixty years.

Charles IX. (1600–1611) carried on with splendid vigour the work which had been begun by his father Gustavus Vasa. Under his rule Sweden became a thoroughly Protestant country, and for the first time associated herself to some extent with the general Protestant movement in other lands. Charles watched with especial interest the action of religious parties in Germany, and carefully maintained good relations with the leading German Protestant princes. At home one of his principal aims was to force the aristocracy to be subservient to the crown, and he succeeded as no Swedish king had done before him. For burghers and the peasantry he secured in the diet a more important and more clearly defined place than had formerly belonged to them, and he devised many sagacious measures for the material welfare of his people. He devoted much attention to the development of mining industries, and by the founding of convenient seaports he gave a great impetus to trade. In foreign relations he was not less masterful than in his management of domestic affairs. In 1609 he sent an army into Russia to oppose the false Demetrius, whose pretensions to the Russian throne were supported by Poland. The Swedish generals, after having achieved some success, were obliged to retreat in consequence of a mutiny among their troops; but Charles despatched a fresh force, which did its work so well that the Russians came to terms, and even promised to accept his younger son, Charles Philip, as czar. In the last year of his life Charles was engaged in a war with Christian IV. of Denmark, who invaded Sweden because Charles claimed to be king of the Norwegian Laplanders and sought to exclude the Danes from the extensive trade with Riga. Calmar, notwithstanding the strenuous exertions of Charles, was captured by the Danes, and from this circumstance the struggle came to be known as the Calmar War.

Gustavus Adolphus. Charles IX. was succeeded by his son Gustavus Adolphus (1611–1632), the most illustrious of the kings of Sweden. He was only seventeen years of age when he became king, but he had already given evidence of high intellectual and moral qualities. One of his first public acts was to appoint as chancellor the youngest of his counsellors, Axel Oxenstjerna, a great statesman whose name is intimately associated with all the most prominent events of his reign. By mingled gentleness and firmness Gustavus won almost immediately the goodwill of his subjects, and before he was many years on the throne he became the object of their most enthusiastic devotion. He showed unfailing respect for the rights of the diet, improved its organization, and summoned it regularly once a year. Industry and trade flourished under his wise rule, and he did much to develop the educational system of Sweden by giving splendid endowments to the university of Upsala and by founding the university of Dorpat and many schools and colleges. He introduced into the army a rigid system of discipline, yet he was adored by his soldiers, who had perfect faith in his military genius and were touched by his care for their welfare and by the cheerfulness with which, when necessary, he shared their hardships.

The war with Denmark which had been begun in his father's time he was obliged to continue, but he did so very unwillingly, and as soon as possible (in 1613) he signed a treaty of peace, by which, in return for the payment of a million thalers, Sweden received back all the territory that had been conquered by the Danes. Having no further cause of anxiety in this direction, he prosecuted with renewed vigour the war with the Russians, who had not kept their promise to recognize Prince Charles Philip as czar. The Swedish general, Count de la Gardie, had gained many advantages in the struggle, and when

Gustavus himself took part in it the Swedes were so successful that in 1617 the czar Michael was glad to conclude the peace of Stolbova, giving up Kexholm, Carelia, and Ingermanland, and confirming Sweden in the possession of Esthonia and Livonia The next task of Gustavus was to subdue Sigismund of Poland, who had formally renewed his claim to the crown of Sweden after Charles IX's death, and had proved himself one of the most troublesome of the young Swedish king's enemies In 1621 Gustavus took the field against him, and achieved a series of brilliant successes, which were interrupted only when, in 1629, Austria sent to the aid of Poland a force of 10,000 men under Arnheim

Meanwhile the Thirty Years' War, begun in 1618, had been raging in Germany Christian IV of Denmark, who had intervened on behalf of the Protestants, had been forced to lay down his arms, and it seemed in the highest degree probable that the Catholic reaction, headed by the fanatical emperor Ferdinand II, was about to be completely triumphant Gustavus, like his father and grandfather, was an enthusiastic Protestant, and he had watched with grief and dismay the misfortunes of those who were struggling for the right of free judgment in religion At last he resolved to give them the support they so urgently needed, and, in order that he might without unnecessary delay act upon his decision, he arranged with Poland in 1629 that there should be an armistice for six years He then began to make preparations for his great enterprise, and in 1630 he embarked for Germany with an army of 15,000 men In undertaking this splendid task he was not influenced only by religious motives He wished to punish the Austrians for having helped the Poles, he hoped to find an opportunity of adding to Swedish territory, and there are reasons for supposing that he dreamed of snatching the imperial crown from the Hapsburg dynasty and placing it on his own head But all the evidence we possess goes to show that these objects were subordinate His principal aim was to save Protestantism in Germany from extinction

He had many unexpected difficulties to contend with, for he was distrusted by most of the German Protestant princes Very soon, however, his tact and courage enabled him to overcome every obstacle, and at Breitenfeld he gained a decisive victory over the imperial general Tilly After this great success the confidence of the German Protestants revived, and Gustavus was everywhere received as their deliverer Tilly tried to prevent him from crossing the Lech, but was again defeated, and the Swedish king took possession of Munich, having already held court at Frankfort For some time the destinies of the empire appeared to be at his disposal, but all the hopes excited by his heroic career were suddenly cut short by his death in the battle of Lutzen in 1632

Christina. Gustavus was succeeded by his daughter Christina, whom, before his departure for Germany, he had presented to the diet as heiress to the crown During her minority Sweden was governed by five nobles whom the diet appointed to be her guardians, the foremost place being given to Axel Oxenstjerna They continued the foreign policy of Gustavus, maintaining in Germany a powerful army, which, although no longer uniformly successful, gained many victories over the imperial forces Christina carefully educated in accordance with instructions left by her father, became one of the most cultivated women of the 17th century, and at an early age she astonished her guardians by the vigour of her understanding In 1644, on her eighteenth birthday, she assumed supreme power, and for some time she fulfilled all the expectations which had been formed as to her reign In 1645 she brought to an end a war with Denmark which had been begun two years before The Danes had been repeatedly defeated, and by the treaty of Bromsebro they resigned to Sweden Jemtland and Harjeaadalen along with the islands of Gotland and Oesel, and gave up Halland for a period of twenty-five years Contrary to the advice of Oxenstjerna, Christina pressed for the conclusion of peace in Germany, and, when her object was attained, the Swedes had no reason to be dissatisfied with the result By the peace of Westphalia, concluded in 1648, Sweden obtained the duchies of Bremen, Verden, and Western Pomerania, a part of Eastern Pomerania, and Wismar Moreover, Sweden was recognized as a state of the empire

The Swedish people were anxious that Christina should marry, but she declined to sacrifice her independence In 1649, however, she persuaded the diet to accept as her successor the best of her suitors, her cousin Charles Gustavus of Pfalz-Zweibrucken, the son of the only sister of Gustavus Adolphus In the following year she was crowned with great pomp About this time her character seemed to undergo a remarkable change She became wayward and restless, neglected her tried counsellors, and followed the advice of self-seeking favourites So much discontent was aroused by her extravagance and fickleness that she at last announced her determination to abdicate, and she abandoned her purpose only in deference to Oxenstjerna's entreaties She now devoted herself to her duties with renewed ardour, and made her court famous by inviting to it Descartes, Grotius, Salmasius, and other scholars and philosophers But she had soon to encounter fresh difficulties During the Thirty Years' War the influence of the nobles had been greatly increased, partly in consequence of their position in the army, partly through the wealth they acquired in Germany They made as usual so bad a use of their power that an agitation which seemed likely to have most serious consequences sprang up against them among the peasants, the burghers, and the clergy Unable to bring order out of the prevailing confusion, and longing for repose, Christina finally resolved to resign the crown, and in 1654 she formally laid the royal insignia before the diet in order that they might be transferred to Charles Gustavus, who forthwith became king as Charles X Christina imme- Charles X diately left the country, and did not return to it for many years She ultimately made some attempts to recover the crown, as well as to be elected queen of Poland, but her efforts were not successful She joined the Roman Church, and there was much talk at all the courts in Europe about the eccentricities of her character and about her passionate love of art and learning

Charles X (1654-1660) devoted his energies chiefly to war, in which he was brilliantly successful He began his military career by attacking Poland, whose king claimed to be the true heir to the Swedish crown In a great battle at Warsaw Charles destroyed the Polish army, and Poland would probably soon have been absolutely at his mercy but for the intervention of Russia, which sought to weaken him by invading Esthonia and Livonia While the war with Poland and Russia was in progress, Charles became involved in a struggle with Denmark, and he conducted it so vigorously and skilfully that the Danes, by the peace of Roeskilde, signed in 1658, gave up Scania, Halland, Blekinge, and various other territories War with Denmark was several times renewed, and at the time of his death Charles was engaged in making extensive preparations for a fresh onslaught

He was succeeded by his son Charles XI, a child of Charles XI four years of age. During the minority of Charles XI the government was carried on by his mother Hedwig Eleonore and by the chancellor De la Gardie and four other ministers In 1660 they concluded with Poland the

peace of Oliva, whereby Sweden received the whole of Livonia as far as the Duna. Soon afterwards peace was also concluded with Denmark and Russia, the former receiving back Drontheim and Bornholm, which had been taken by Charles X. Sweden, however, kept Scania, Halland, and Blekinge, which were now finally severed from the Danish monarchy. In 1672 Charles XI himself assumed the direction of affairs. For some time he seemed to take little interest in public business, and in 1674 he was rash enough to send an army into Germany to aid Louis XIV in his war with the United Provinces and their allies. The Swedes were defeated at Fehrbellin by the elector of Brandenburg, who at once followed up his victory by taking possession of Pomerania. Christian V of Denmark, thinking he had now a good opportunity of recovering Scania, joined the enemies of France and Sweden, and at sea the Danes gained several great victories over the Swedes. Charles XI, aroused by these disasters, began to show the real vigour of his character. He placed himself at the head of his army, and in several battles so decisively defeated the Danes that they were driven from Scania, the greater part of which they had occupied. When peace was made in 1679, Sweden had to give up to Brandenburg a part of Pomerania, but she sustained no other losses.

At this time the finances of Sweden were in utter confusion, and the revenue was not nearly large enough to cover the necessary expenditure. So many of the crown lands had from time to time been given away to nobles that the administration could not be carried on without a system of crushing taxation. The common people, unable to bear the burdens imposed upon them, had often insisted that these lands should be taken back. Charles XI became convinced that there was no other way out of his difficulties, and in 1680, with the sanction of the diet, he ordered that the fourth part of all the crown lands which had been given away during the previous thirty years should be restored. This, however, was only the beginning of the so-called process of reduction, which was soon extended and carried out with ruthless severity. By this measure some of the foremost families in Sweden were ruined, and the crown was made almost independent of the diet, for it recovered no fewer than ten counties, seventy baronies, and many smaller estates. Charles became virtually an absolute sovereign, and on the whole he made an excellent use of his power. For more than a century Sweden had been almost constantly engaged in war. She now enjoyed a period of repose, and profited greatly by the king's vigorous administration. He built fortresses, reorganized the army and navy, and carried on many important public works in the interests of commerce. He also founded the university of Lund, and made larger provision for popular education, frequently impressing upon the clergy the duty of attending to the intellectual needs of their parishioners. His comparatively early death was lamented by the great majority of the people, who were grateful for the steady determination with which he applied himself to the duties of his office.

Charles XII

Charles XI was succeeded by his son Charles XII (1697–1718), the most brilliant although not the greatest figure in Swedish history. He was a youth of fifteen when his father died, and he was so enthusiastically devoted to sport and all kinds of physical exercise that he seemed to be utterly destitute of political ambition. Accordingly Augustus II of Poland and Saxony, Peter I of Russia, and Frederick IV of Denmark, thinking the time had come for the recovery of the possessions taken from their predecessors by Sweden, formed an alliance against him, and they appear to have had no doubt that he would be easily overcome. Charles XII, however, was in reality a man of extraordinary vigour and daring, and he soon convinced his enemies that they would find in him a formidable opponent. In 1700 he began what is known as the Northern War by suddenly advancing against Copenhagen, which he was about to besiege when Frederick, alarmed by the overwhelming numbers of the enemy, accepted Charles's terms, and signed the peace of Travendahl. Charles at once crossed the Baltic to attack Augustus II and Peter I, the former of whom was besieging Riga, while the latter threatened Narva. At Narva the Swedish king gained a splendid victory, and afterwards he defeated the Saxons, driving them away from Riga. If he had now concluded peace, he might have been for many years by far the greatest potentate in northern Europe. But he was resolved to humiliate Augustus II, and this he did most effectually. Defeated at Klissoff, Augustus was held to have forfeited the throne of Poland, and at Charles's suggestion Stanislaus Leczinski was elected king. Charles followed Augustus into Saxony, and in 1706 forced him to conclude the treaty of Altranstadt. Meanwhile Peter I had been taking possession of Swedish territory on the Baltic, and on a portion of it had begun to build St Petersburg. Instead of attacking him directly, Charles resolved to thwart him by seizing Moscow, and this decision proved fatal to his great designs. Worn out by a long and dreary march, during which many soldiers died of hunger and disease, his dispirited army was defeated at Poltava (1709), and Charles, ignorant of the real condition of the enemy's forces, fled across the Russian frontier into Turkey. He remained five years in the Turkish dominions, trying to induce the sultan to become his ally. But, although war did break out between Russia and Turkey, the Turks had little confidence in Charles, for it was supposed that he wished to become king of Poland, and the sultan suspected that if this scheme were effected he might become a dangerous enemy of the Ottoman empire. Convinced at last that nothing was to be gained from Turkey, Charles made his escape, and in fourteen days rode from Adrianople to Stralsund. In his absence the war had been continued by Peter I, who had soon been joined again by Augustus II and Frederick IV, and ultimately the alliance was strengthened by the accession of the king of Prussia and the elector of Hanover, each of whom was eager to possess those Swedish territories which were in the neighbourhood of his own dominions. In Stralsund, which was besieged by an army of Danes, Saxons, Prussians, and Russians, Charles displayed astonishing valour and military skill, but about a year after his arrival the town was obliged to surrender. He then went to Lund, adopted vigorous measures for the defence of the Swedish coasts, and attacked Norway. By the advice of his friend Baron Goertz he entered into negotiations with Peter I, who was not unwilling to come to terms. Had Charles lived, it is possible that the tide of misfortune might have turned, but he was shot dead while engaged in besieging Frederikshall. His intention was to conquer Norway after having made peace with Russia, and from Norway to cross to Great Britain, where he hoped to punish the elector of Hanover by placing the Pretender on the English throne.

All the conditions of political life in Sweden were now changed. The Swedish people were surrounded by a crowd of enemies whom they could not hope to overcome, and in the confusion caused by the Northern War the nobles had recovered their ancient power. As Charles XII had no children, it was doubtful whether the crown should pass to his younger sister Ulrica Eleonore or to Charles Frederick of Holstein Gottorp, the son of his elder sister Hedvig Sophia. The nobles decided in favour of

Ulrica Eleonore Ulrica Eleonore, who secured their support by undertaking to place all real power in their hands. In 1720 her authority was transferred to her husband, Prince Frederick of Hesse, who reigned as Frederick I until his death in 1751. *Frederick I* He reigned, however, only in name, for the diet, which now practically meant the nobles, usurped every important prerogative of the crown. There were two parties, known as the Hats and the Caps, who assailed one another with much vehemence; but on one point they were agreed, and that was that the Swedish people should in future be ruled, not by a king, or by a king acting in conjunction with the diet, but by the aristocracy.

Meanwhile Sweden had been shorn of most of the foreign territory for which in past times she had made so many sacrifices. In 1719 she had given up Bremen and Verden to Hanover; in 1720 Stettin and Western Pomerania as far as the Peene were resigned to Prussia; and in 1721 Russia obtained Livonia, Esthonia, Ingermanland, and a part of Viborg län. In 1741, against the wish of King Frederick, the Hats plunged into a war with Russia; and the consequence was that in 1743 Sweden had to conclude the degrading peace of Åbo, by which she lost Eastern Finland. She had even to beg Russia to aid her against Denmark, and she was obliged to recognize Adolphus Frederick of Holstein-Gottorp, a relative of the czarina Elizabeth, as heir to the throne.

From the reign of Charles IX. until that of Charles XII. Sweden had been one of the greatest powers in Europe. She had conducted many wars successfully; she had secured a vast territory beyond her proper limits; in the crisis of the struggle between Catholicism and Protestantism she had lent powerful support to those who were fighting for spiritual freedom. In the management of international relations during this period no great decision was arrived at by any European state without reference to her wishes; and there seemed to be solid reasons for the belief that her power would be enduring. Yet she suddenly sank from her high position to that of a third-rate state, which exercised little or no influence on the affairs of the rest of the world. This striking change was immediately due to the calamities brought upon his country by Charles XII., but sooner or later it would have come even if he had never lived. The circumstances of Europe were in his time very different from those with which Gustavus Adolphus had to deal. Russia had emerged as a united and growing state; Prussia had begun to display some of the qualities which were ultimately to make her supreme in Germany; and Hanover had been made important by the accession of the house of Brunswick to the throne of Great Britain. Sweden could not have permanently maintained her conquests against these new political forces. Charles XII. by his bold but headstrong policy, only hastened a process which was in any case inevitable.

Adolphus Frederick Under Adolphus Frederick (1751–1771) Sweden took part in the Seven Years' War, siding with the enemies of Frederick the Great. But she was now so feeble, and her statesmen were so incompetent, that her intervention led to no serious results. The Hats, who were responsible for the humiliation brought upon Sweden by this exhibition of her weakness, had to make way for the Caps; but neither party had the power or the will to arouse the nation from the lethargy into which it had fallen. *Gustavus III* Gustavus III., Adolphus Frederick's son (1771–1792), was a man of a very different temper from his indolent father. He had great energy of character, a thorough comprehension of some of the conditions of political progress, and a frank and persuasive manner. In early youth he seems to have convinced himself that it would be impossible for Sweden to become a prosperous country unless the royal authority were restored; and when at the age of twenty-five he succeeded his father he secretly resolved to make the crown supreme.

He carried out his plans with remarkable ability and caution. Under the pretence that he wished to introduce a new system of military manœuvres, he collected around him about two hundred officers, most of whom were young men; and they were gradually induced to pledge themselves to support him. Agents were despatched to win over the regiments in the provinces; and Gustavus was careful to make a good impression on the burgher class and on the peasantry. When all was ready, the commandant of Christianstad, on the 12th of August 1772, as previously arranged, formally renounced his allegiance to the diet; and one of the king's brothers went to the town with the regiments in the neighbourhood and pretended to besiege it. Suspicions were aroused at Stockholm; and at a meeting of the council of state Gustavus was bitterly reproached by some of the members. He then boldly proclaimed his purpose. The members of the council of state were arrested, and the king received the homage of the leading authorities in the military, naval, and civil services. The diet was forthwith summoned, and at its first sitting Gustavus spoke of the lamentable condition of the kingdom, and of the need for more efficient methods of government. He had no wish, he said, to establish an absolute monarchy; but it was necessary that the supremacy of the aristocracy should be destroyed, and that the country should re-establish the system which existed in the time of Gustavus Adolphus, when the crown and the diet had each its separate functions and worked cordially together. A new constitution, which had been drawn up, placing executive power wholly in the king's hands, was afterwards read, and at once accepted.

Delivered from the trammels which had hampered his immediate predecessors, Gustavus worked hard for the welfare of his subjects. Agriculture, industry, and trade revived; the army and navy were improved; and the educated classes began to show greater interest in art, literature, and science. Unfortunately the king took the court of France as the model for his own court, and the country resented the incessant demands for money which were rendered necessary by his personal extravagance. In 1788 he declared war with Russia, hoping to recover Livonia and the part of Finland which Russia had conquered; and the discontent he had aroused found expression in the army, the leaders of which declined to fight, protesting that the war ought not to have been begun without the sanction of the diet. At the same time Denmark was persuaded by the czarina Catherine to attack Sweden. Gustavus seemed to be on the verge of ruin, but he was saved by his own courage and sagacity. Hastening back from Finland, he was able to rescue Gothenburg from the Danes with a force raised in Dalecarlia; and soon afterwards, through the intervention of England and Prussia, Denmark was induced to withdraw from the struggle. The majority of the diet, seeing the dangers to which the nation was exposed, rallied around the king, and, notwithstanding the opposition of the nobles, recognized the right of the crown to declare war. Impressed by the firm and rapid action of Gustavus, the army returned to its allegiance, and the conflict with Russia was begun in earnest. In 1789 the Swedes were very unsuccessful, but in the following year they gained several victories both at sea and on land. Gustavus saw, however, that it would be impossible for him to wrest from Russia any of her territories, and in 1790 peace was concluded on the understanding that both states should occupy the position they held before the war.

Gustavus was greatly excited by the French Revolution, and sought to form an alliance with Russia, Prussia, and Austria for the restoration of Louis XVI. But the diet refused to support his wild schemes. Several nobles, desiring to avenge the supposed wrongs of their order, entered into a conspiracy against him, and in 1792 he was mortally wounded by an assassin who acted as their agent.

Gustavus IV. Gustavus IV. (1792–1809) was not quite fourteen years old when his father was murdered, and during his minority the government was carried on by his uncle the duke of Sodermanland. Gustavus began to exercise royal authority in 1796. His reign was remarkable chiefly for the obstinacy with which he clung to his own ideas, no matter how far they might conflict with the obvious interests of his country. He had a bitter detestation of Bonaparte, and in 1803 went to Carlsruhe in the hope that he might induce the emperor and some of the German princes to act with him in support of the Bourbons. His enmity led to an open rupture with France, and even after the peace of Tilsit, when Russia and Prussia offered to mediate between him and the French emperor, he refused to come to terms. The consequence was that he lost Stralsund and the island of Rugen. He displayed so much friendship for England that Russia and Denmark, acting under the influence of France, declared war against him, and the whole of Finland was soon held by Russian troops. Gustavus attacked Norway, but his army was driven back by the Danes and Norwegians. He still declined to make peace, and he even alienated England when she attempted to influence him by moderate counsels. The Swedish people were so enraged by the consequences of his policy that in 1809 he was dethroned, and the claims of his descendants to the crown were also repudiated. He was succeeded by the duke of Sodermanland, who reigned as Charles XIII.

Charles XIII. Charles XIII. (1809–1818) concluded peace with Russia, Denmark, and France, ceding to Russia by the treaty of Frederikshamm (1809) the whole of Finland. The loss of this territory, which had been so long associated with the Swedish monarchy, was bitterly deplored by the Swedes, but it was universally admitted that under the circumstances the sacrifice was unavoidable. Charles assented to important changes in the constitution, which were intended to bring to an end the struggle between the crown and the aristocracy and to provide some security for the maintenance of popular rights. The king was still to be at the head of the executive, but it was arranged that legislative functions and control over taxation should belong to the diet, which was to consist of four orders—nobles, clergymen, burghers, and peasants.

As Charles XIII. was childless, the diet elected as his successor Prince Christian Augustus of Holstein-Sonderburg-Augustenburg. In 1810, soon after his arrival in Stockholm, this prince suddenly died, and Sweden astonished Europe by asking Marshal Bernadotte to become heir to the throne. Bernadotte, who took the name of Charles John, was a man of great vigour and resource, and soon made himself the real ruler of Sweden. Napoleon treated Sweden as almost a conquered country, and compelled her to declare war with England. Bernadotte, associating himself heartily with his adopted land, resolved to secure its independence, and entered into an alliance with Russia. In 1813 he started with an army of 20,000 Swedes to co-operate with the powers which were striving finally to crush the French emperor. The proceedings of the Swedish crown prince were watched with some suspicion by the allies, as he was evidently unwilling to strike a decisive blow at France, but after the battle of Leipsic he displayed much activity. He blockaded Hamburg, and by the peace of Kiel, concluded in January 1814, he forced Denmark to give up Norway. He then entered France, but soon returned, and devoted his energies to the conquest of Norway, which was very unwilling to be united with Sweden. Between the months of July and November 1814 the country was completely subdued, and Charles XIII. was proclaimed king. The union of Sweden and Norway, which has ever since been maintained, was recognized by the congress of Vienna, and it was placed on a sound basis by the frank adoption of the principle that, while the two countries should be subject to the same crown and act together in matters of common interest, each should have complete control over its internal affairs. The new relation of their country to Norway gave much satisfaction to the Swedes, whom it consoled in some measure for the loss of Finland. It also made it easy for them to transfer to Prussia in 1815 what remained of their Pomeranian territories.

In 1818 Bernadotte mounted the throne as Charles XIV., and he reigned until he died in 1844. Great material improvements were effected during his reign. He caused new roads and canals to be constructed, he encouraged the cultivation of districts which had formerly been barren, and he founded good industrial and naval schools. He was not, however, much liked by his subjects. He never mastered the Swedish language, and he was so jealous of any interference with his authority that he sternly punished the expression of opinions which he disliked. To the majority of educated Swedes the constitution seemed to be ill-adapted to the wants of the nation, and there was a general demand for a political system which should make the Government more directly responsible to the people. In 1840 a scheme of reform was submitted to the diet by a committee which had been appointed for the purpose, but the negotiations and discussions to which it gave rise led to no definite result. Charles XIV.

Charles XIV. was succeeded by his son Oscar I. (1844–1859). Oscar had always expressed sympathy with liberal opinions, and it was anticipated that the constitutional question would be settled during his reign without much difficulty. These expectations were disappointed. The diet met soon after his accession, and was asked to accept the scheme which had been drawn up in 1840. The measure received the cordial approval of the burghers and peasants, but was rejected by the nobles and the clergy. In 1846 a committee was appointed to prepare a new set of proposals, and late in the following year the discussion of its plans began. While the debates on the subject were proceeding some excitement was produced by the revolutionary movement of 1848, and a new ministry, pledged to the cause of reform, came into office. The scheme devised by this ministry was accepted by the committee to which it was referred, but the provisions of the existing constitution rendered it necessary that the final settlement should depend upon the vote of the next diet. When the diet met in 1850 it was found that the difficulties in the way were for the time insuperable. The proposals of the Government were approved by a majority of the burghers, but they were opposed by the nobles, the clergy, and the peasantry. The solution of the problem had, therefore, to be indefinitely postponed. Oscar I.

Although the constitution was not reformed, much was done in other ways during the reign of Oscar I. to promote the national welfare. The criminal law was brought into accordance with modern ideas, and the law of inheritance was made the same for both sexes and for all classes of the community. Increased freedom was secured for industry and trade, the methods of administration were improved, and the state took great pains to provide the country with an efficient railway system. The result of the wise legislation of this period was that a new spirit of

enterprise was displayed by the commercial classes, and that in material prosperity the people made sure and rapid progress.

In 1848, when the difficulty about Schleswig-Holstein led to war between Denmark and Germany, the Swedes sympathized cordially with the Danes, of whom they had for a long time ceased to be in the slightest degree jealous. Swedish troops were landed in Funen, and through the influence of the Swedish Government an armistice was concluded at Malmo. The excitement in favour of Denmark soon died out, and when the war was resumed in 1849 Sweden resolutely declined to take part in it. The outbreak of the Crimean War greatly alarmed the Swedes, who feared that they might in some way be dragged into the conflict. In 1855, having some reason to complain of Russian acts of aggression on his northern frontiers, the king of Sweden and Norway concluded a treaty with England and France, pledging himself not to cede territory to Russia, and receiving from the Western powers a promise of help in the event of his being attacked. The demands based on this treaty were readily granted by Russia in the peace of Paris in 1856.

arles V. Charles XV. (1859–1872) mounted the throne after his father's death. Nearly two years before his accession he had been made regent in consequence of Oscar I.'s ill-health. Charles was a man of considerable intellectual ability and of decidedly popular sympathies, and during his reign the Swedish people became enthusiastically loyal to his dynasty. In 1860 two estates of the realm—the peasants and the burghers—presented petitions, begging him to submit to the diet a scheme for the reform of the constitution. This request he willingly granted. The main provisions of the plan offered in his name were that the diet should consist of two chambers,—the first chamber to be elected for a term of nine years by the provincial assemblies and by the municipal corporations of towns not represented in those assemblies, the second chamber to be elected for a term of three years by all natives of Sweden possessing a specified property qualification. The executive power was to belong to the king, who was to act under the advice of a council of state responsible to the national representatives. This plan, which was received with general satisfaction, was finally adopted by the diet in 1866, and is still in force.

Early in the reign of Charles XV. there were serious disputes between Sweden and Norway, and the union of the two countries could scarcely have been maintained but for the tact and good sense of the king. He also exercised a steadying influence in 1863, when his people expressed passionate sympathy with the Poles in their insurrection against Russia, and with the Danes in their war with Prussia and Austria.

car II. Charles XV. died in 1872, and was succeeded by his brother Oscar II., who still reigns (1887). Under him Sweden has maintained good relations with all foreign powers, and political disputes in the diet have never been serious enough to interrupt the material progress of the nation.

Many documents relating to Swedish history have been published in *Scriptores Rerum Suecicarum Medii Ævi*, edited by Fant, Geijer, and Schroder, in *Scriptores Suecici Medii Ævi*, edited by Rietz, and in other collections. Among the older histories of Sweden may be named those by Dalin and Lagerbring in the 18th century and by Ruhs in the 19th. More important works on the subject are those by Geijer, Carlson, Fryxell, and Strinnholm. (J. SI.)

PART III.—LITERATURE.

Swedish literature, as distinguished from compositions in the common *norræna tunga* of old Scandinavia, cannot be said to exist earlier than the 13th century. Nor until the period of the Reformation was its development in any degree rapid or copious. The oldest form in which Swedish[1] exists as a written language is the series of manuscripts known as *Landskapslagarne*, or "The Common Laws." These are supposed to be the relics of a still earlier age, and it is hardly believed that we even possess the first that was put down in writing. The most important and the most ancient of these codes is the "Elder West Gota Law," reduced to its present form by the law-man Eskil about 1230. Another of great interest is Magnus Eriksson's "General Common Law," which was written in 1347. These ancient codes have been collected and edited by Prof. Schlyter. The chief ornament of mediæval Swedish literature is *Um Styrilse Kununga ok Hofdinga* ("On the Conduct of Kings and Princes"), first printed, by command of Gustavus II. Adolphus, in 1634. The writer is not known; it has been conjecturally dated 1325. It is a handbook of moral and political teaching, expressed in terse and vigorous language. St Bridget, or Birgitta (1302?–1373), an historical figure of extraordinary interest, has left her name attached to several important religious works, in particular to a collection of *Uppenbarelser* ("Revelations"), in which her visions and ecstatic meditations are recorded, and a version, the first into Swedish, of the five books of Moses. This latter was undertaken, at her desire, by her father-confessor Mattias (d. 1350), a priest at Linkoping. The translation of the Bible was continued a century later by a monk named Johannes Budde (d. 1484).

In verse the earliest Swedish productions were probably the folk-songs. The age of these, however, has been commonly exaggerated. It is doubtful whether any still exist which are as old, in their present form, as the 13th century. The bulk are now attributed to the 15th, and many are doubtless much later still. The last, such as "Axel och Valborg," "Liten Karin," "Kampen Grimborg," and "Habor och Signild," deal with the adventures of romantic mediæval romance. Almost the only positive clue we hold to the date of these poems is the fact that one of the most characteristic of them, "Engelbrekt," was written by Tomas, bishop of Strengnas, who died in 1443. Tomas, who left other poetical pieces, is usually called the first Swedish poet. There are three rhyming chronicles in mediæval Swedish, all anonymous. The earliest, *Erikskronikan*, is attributed to 1320; *Karlskronikan* is at least 120 years later; and the third, *Sturekronikorna*, was probably written about 1500. All three have been edited by G. E. Klemming. The collection of rhymed romances which bears the name of *Queen Euphemia's Songs* must have been written before the death of that lady in 1312. They are believed to date from 1303. They are versions of three mediæval stories taken from French and German sources, and they deal respectively with King Arthur and the Table Round, with Duke Frederick of Normandy, and with Flores and Blanchefler. They possess very slight poetic merit in their Swedish form. A little later the romance of *King Alexander* was translated by, or at the command of, Bo Jonsson Grip; this is more meritorious. A brilliant and pathetic relic of the close of the mediæval period exists in the *Love Letters* addressed in 1498 by Ingrid Persdotter, a nun of Vadstena, to the young knight Axel Nilsson. The first book printed in the Swedish language appeared in 1495.

The 16th century added but little to Swedish literature, and that little is mostly connected with the newly-founded university of Upsala. The Renaissance scarcely made itself felt in Scandinavia, and even the Reformation failed to waken the genius of the country. Psalms and didactic

[1] For the Swedish language, see SCANDINAVIAN LANGUAGES, vol. xxi. pp. 370–372.

spiritual poems were the main products of Swedish letters in the 16th century Two writers, the brothers Petri, take an easy prominence in so barren a period Olaus Petri (1497–1552) and Laurentius Petri (1499–1573) were Carmelite monks who proceeded in 1516 to Wittenberg to study theology under Luther, and who came back to Sweden as the apostles of the new faith Olaus, who is one of the noblest figures in Swedish annals, was of the executive rather than the meditative class He found time, however, to write a *Chronicle*, which is the earliest prose history of Sweden, a mystery play, *Tobie Comedia*, which is the first Swedish drama, and three psalm-books, the best known being published in 1530 under the title of *Någre Gudhelige Visor* ("Certain Divine Songs") Laurentius Petri, who was archbishop of all Sweden, edited or superintended the translation of the Bible published at Upsala in 1540 He also wrote many psalms. Laurentius Andreæ, who died in 1552, had previously prepared a translation of the New Testament, which appeared in 1526 He was a polemical writer of prominence on the side of the Reformers Finally, Petrus Niger (Peder Svart), bishop of Vesterås (d 1562), wrote a chronicle of the life of Gustavus I up to 1533, in excellent prose The same writer left unpublished a history of the bishops of Westerås his predecessors The latter half of the 16th century is a blank in Swedish literature

With the accession of Charles IX and the consequent development of Swedish greatness, literature began to assert itself in more vigorous forms The long life of the royal librarian, Johannes Buræus (1568–1652), formed a link between the age of the Petri and that of Stjernhjelm Buræus studied all the sciences then known to mankind, and confounded them all in a sort of Rabbinical cultus of his own invention, a universal philosophy in a multitude of unreadable volumes But he was a patient antiquarian, and advanced the knowledge of ancient Scandinavian mythology and language very considerably He awakened curiosity and roused a public sympathy with letters, nor was it without significance that two of the greatest Swedes of the century, Gustavus Adolphus and the poet Stjernhjelm, were his pupils The reign of Charles IX. saw the rise of secular drama in Sweden The first comedy was the *Tisbe* of Magnus Olai Asteropherus (d 1647), a coarse but witty piece on the story of Pyramus and Thisbe, acted by the schoolboys of the college of Arboga in 1610 This play is the *Ralph Roister Doister* of Swedish literature A greater dramatist was Johannes Messenius (1579–1636), who, having been discovered plotting against the Government during the absence of Gustavus in Russia, was condemned to imprisonment for life—that is, for twenty years Before this disaster he had been professor in Upsala, where his first historical comedy *Disa* was performed in 1611 and the tragedy of *Signill* in 1612 The design of Messenius was to write the history of his country in fifty plays, he completed and produced six These dramas are not particularly well arranged, but they form a little body of theatrical literature of singular interest and value Messenius was a genuine poet, the lyrics he introduces have something of the charm of the old ballads He wrote abundantly in prison, his *magnum opus* was a history of Sweden in Latin, but he has also left, in Swedish, two important rhyme-chronicles Messenius was imitated by a little crowd of playwrights Nikolaus Catonius (d 1655) wrote a fine tragedy on the Trojan War, *Trojenborgh*, in which he excelled Messenius as a dramatist Andreas Prytz, who died in 1655 as bishop of Linkoping, produced several religious chronicle plays from Swedish history Jacobus Rondeletius (d 1662) wrote a curious "Christian tragi-comedy" of *Judas Redivivus* These plays were all acted by schoolboys and university youths, and when they went out of fashion among these classes the drama in Sweden almost entirely ceased to exist Two historians of the reign of Charles IX, Erik Goransson Tegel (d 1636) and Ægidius Girs (d 1639), deserve mention

Stjernhjelm

The reign of Gustavus Adolphus was adorned by one great writer, the most considerable in all the early history of Sweden The title of "the Father of Swedish Poetry" has been universally awarded to Goran Lilja, better known by his adopted name of Georg Stjernhjelm (1598–1672). This extraordinary man was born at Wika in Dalecarlia on the 7th of August 1598 He took his degree at Greifswald, and spent some years in travelling over every quarter of Europe On his return he attracted the notice of Gustavus Adolphus, who gave him a responsible post at Dorpat in 1630, and raised him next year to the nobility After the king's death Christina attached him, as a kind of poet laureate, to her court in Stockholm His property lay in Livonia and when the Russians plundered that province in 1656 the poet was reduced to extreme poverty for two or three years He died at Brunkeborg in Stockholm on the 22d of April 1672 Stjernhjelm was a man of almost universal attainment, but it is mainly in verse that he has left his stamp upon the literature of his country He found the language rough and halting, and he moulded it into perfect smoothness and elasticity His master Buræus had written a few Swedish hexameters by way of experiment Stjernhjelm took the form and made it national His greatest poem, *Hercules*, is a didactic allegory in hexameters, written in very musical verse, and with an almost Oriental splendour of phrase and imagery In its faults as well as its beauties the style of Stjernhjelm reminds us of that of his great Dutch contemporary Vondel He was certainly influenced by a writer a few months older than himself, the German poet Martin Opitz The *Hercules*, which deals with the familiar story of the dispute for the hero between Duty and Pleasure, was first printed, at Upsala, in 1653, but was finished some years earlier *Brollops-Besvars Ihughkommelse*, a sort of serio-comic epithalamium in the same measure, is another very brilliant work of Stjernhjelm His masques, *Then fångne Cupido* ("Cupid Caught") (1649), *Freds-afl* ("The Birth of Peace") (1649), and *Parnassus Triumphans* (1651), were written for the entertainment of the queen, and have a charming lyrical lightness He can scarcely, however, be said to have been successful in his attempt, in the first two of these, to introduce unrhymed song-measures Stjernhjelm was an active philologist, and left a great number of works on language, of which only a few have ever been printed He wrote letter A of the earliest Swedish dictionary, published in 1643, and a work on mathematics entitled *Archimedes Reformatus* No brighter intellectual figure arose in Sweden till the beginning of the 19th century

Rosenhane

The claim of Stjernhjelm to be the first Swedish poet may be contested by a younger man, but a slightly earlier writer, Gustaf Rosenhane (1619–1684), who was a reformer on quite other lines If Stjernhjelm studied Opitz, Rosenhane took the French poets of the Renaissance for his models, and in 1650 wrote a cycle of one hundred sonnets, the earliest in the language, these were published under the title *Venerid* in 1680 Rosenhane printed in 1658 a "Complaint of the Swedish Language" in thirteen hundred rattling rhyming lines, and in 1682 a collection of eighty songs He was a metrist of the artistic order, skilful, learned, and unimpassioned His zeal for the improvement of the literature of his country was beyond question. Most of the young poets followed Stjernhjelm rather than Rosen-

hane As personal friends and pupils of the former, the brothers Columbus deserve special attention Each wrote copiously in verse, but Johan (1640–1684) almost entirely in Latin, while Samuel (1642–1678), especially in his *Odæ Suethicæ*, showed himself an apt and fervid imitator of the Swedish hexameters of Stjernhjelm Of a rhyming family of Hjarne, it is enough to mention one member, Urban Hjarne (1641–1724), who introduced the new form of classical tragedy from France, in a species of transition from the masques of Stjernhjelm to the later regular rhymed dramas His best play was a *Rosimunda* Lars Johansson (1642–1674), who called himself "Lucidor the Unfortunate," has been the subject of a whole tissue of romance, most of which is fabulous It is true, however, that he was stabbed, like Marlowe, in a midnight brawl at a tavern His poems were posthumously collected as *Flowers of Helicon, Plucked and Distributed on various occasions by Lucidor the Unfortunate* Stripped of the myth which had attracted so much attention to his name, Lucidor proves to be an occasional rhymster of a very low order Haquin Spegel (1645–1714), the famous archbishop of Upsala, wrote a long didactic epic in alexandrines, *God's Labour and Rest*, with an introductory ode to the Deity in rhymed hexameters He was also a good writer of hymns Another ecclesiastic, the bishop of Skara, Jesper Svedberg (1653–1735), wrote sacred verses, but is better remembered as the father of Swedenborg Peter Lagerlöf (d 1699) cultivated a pastoral vein in his *Elisandra* and *Lucillis*, he was professor of poetry, that is to say, of the art of writing Latin verses, at Upsala Olof Wexionius (1656–1690?) published his *Sinne-Afvel*, a collection of graceful miscellaneous pieces, in 1684, in an edition of only 100 copies Its existence was presently forgotten, and the name of Wexionius had dropped out of the history of literature, when Hanselli recovered a copy and reprinted its contents in 1863 We have hitherto considered only the followers of Stjernhjelm, we have now to speak of an important writer who followed in the footsteps of Rosenhane Gunno Eurelius, afterwards ennobled with the name of Dahlstjerna (1661–1709), early showed an interest in the poetry of Italy In 1690 he translated Guarini's *Pastor Fido*, and in or just after 1697 published, in a folio volume without a date, his *Kunga-Skald*, the first original poem in *ottava rima* produced in Swedish This is a bombastic and vainglorious epic in honour of Charles XI, whom Eurelius adored, it is not, however, without great merits, richness of language, flowing metre, and the breadth of a genuine poetic enthusiasm He published a little collection of lamentable sonnets when his great master died Eurelius struck the lyre several times in honour of Charles XII, but these poems have all perished He was a true patriot, and grief at the defeat of Poltava is said to have cost him his life Johan Runius (1679–1713), called the "Prince of Poets," published a collection entitled *Dudaim*, in which there is nothing to praise, and with him the generation of the 17th century closes Talent had been shown by certain individuals, but no healthy school of Swedish poetry had been founded, and the latest imitators of Stjernhjelm had lost every vestige of taste and independence

Dahlstjerna

In prose the 17th century produced but little of importance in Sweden Gustavus Adolphus (1594–1632) was the most polished writer of its earlier half, and his speeches take an important place in the development of the language The most original mind of the next age was Olof Rudbeck (1630–1702), the famous author of *Atland er Manhem* He spent nearly all his life in Upsala, building anatomical laboratories, conducting musical concerts, laying out botanical gardens, arranging medical lecture rooms—in a word, expending ceaseless energy on the practical improvement of the university He was a genius in all the known branches of learning, at twenty-three his physiological discoveries had made him famous throughout Europe His *Atland* (or *Atlantica*) appeared in four folio volumes, in Latin and Swedish, in 1679–98, it was an attempt to summon all the authority of the past, all the sages of Greece and the bards of Iceland, to prove the inherent and indisputable greatness of the Swedish nation, in which the fabulous Atlantis had been at last discovered It was the literary expression of the majesty of Charles XI, and of his autocratical dreams for the destiny of Sweden From another point of view it is a monstrous hoard or cairn of rough-hewn antiquarian learning, now often praised, sometimes quoted from, and never read Olof Verelius (1618–1682) had led the way for Rudbeck, by his translations of Icelandic sagas, a work which was carried on with greater intelligence by Johan Peringskjold (1654–1720), the editor of the *Heimskringla* The French philosopher Descartes, who died at Christina's court at Stockholm in 1650, found his chief, though posthumous, disciple in Anders Rydelius (1671–1738), bishop of Lund, who was the master of Dalin, and thus connects us with the next epoch Charles XII, under whose special patronage Rydelius wrote, was himself a metaphysician and physiologist of merit

Rudbeck

A much more brilliant period followed the death of Charles XII The influence of France and England took the place of that of Germany and Italy The taste of Louis XIV, tempered by the study of Addison and Pope, gave its tone to the academical court of Queen Ulrica Eleonore, and Sweden became completely a slave to the periwigs of literature, to the unities and graces of classical France Nevertheless this was a period of great intellectual stimulus and activity, and Swedish literature took a solid shape for the first time This Augustan period in Sweden closed somewhat abruptly about 1765 Two writers in verse connect it with the school of the preceding century Jacob Frese (1691–1729), whose poems were published in 1726, was an elegiacal writer of much grace, who foreshadowed the idyllic manner of Creutz Samuel von Triewald (1688–1743) played a very imperfect Dryden to Dalin's Pope He was the first Swedish satirist, and introduced Boileau to his countrymen His *Satire upon our Stupid Poets* may still be read with entertainment Both in verse and prose Olof von Dalin Dalin (1708–1763) takes a higher place than any writer since Stjernhjelm He was inspired by the study of his great English contemporaries His *Swedish Argus* (1733–34) was modelled on Addison's *Spectator*, his *Thoughts about Critics* (1736) on Pope's *Essay on Criticism*, his *Tale of a Horse* on Swift's *Tale of a Tub* Dalin's style, whether in prose or verse, was of a finished elegance His great epic, *Swedish Freedom* (1742), was written in alexandrines of far greater smoothness and vigour than had previously been attempted When in 1737 the new Royal Swedish theatre was opened, Dalin led the way to a new school of dramatists with his *Brynhilda*, a regular tragedy in the style of Crébillon *père* In his comedy of *The Envious Man*, he introduced the manner of Molière, or more properly that of Holberg His songs, his satires, his occasional pieces, without displaying any real originality, show Dalin's tact and skill as a workman with the pen He stole from England and France, but with the plagiarism of a man of genius, and his multifarious labours raised Sweden to a level with the other literary countries of Europe They formed a basis upon which more national and more scrupulous writers could build their various structures A foreign critic, especially an English one, will never be able to give Dalin so much credit as the

Swedes do, but he was certainly an unsurpassable master of *pastiche*.

Fru Nordenflycht

The only poet of importance who contested the laurels of Dalin was a woman. Hedvig Charlotta Nordenflycht (1718–1763) was the centre of a society which ventured to rival that which Queen Ulrica Eleonore created and Dalin adorned. Both groups were classical in taste, both worshipped the new lights in England and France. Fru Nordenflycht wrote with facility and grace; her collection of lyrics, *The Sorrowing Turtledove* (1743), in spite of its affectation, enjoyed and merited a great success; it was the expression of a deep and genuine sorrow—the death of her husband after a very brief and happy married life. It was in 1744 that she settled in Stockholm and opened her famous literary salon. She was called "The Swedish Sappho," and scandal has been needlessly busy in giving point to the allusion. It was to Fru Nordenflycht's credit that she discovered and encouraged the talent of two very distinguished poets younger than herself, Creutz and Gyllenborg.

Creutz

Gustaf Filip Creutz (1729–1785) was a Finlander who achieved an extraordinary success with his idyllic poems, and in particular with the beautiful pastoral of *Atis och Camilla*, long the most popular of all Swedish poems. In 1763, the year of the death of Dalin and of Fru Nordenflycht, Creutz ceased to write, having been appointed minister to Spain; he gave up poetry for politics.

Gyllenborg

Gustaf Frederik Gyllenborg (1731–1808) was a less accomplished poet, less delicate and touching, more rhetorical and artificial. His epic *Tåget öfver Bält* ("The Expedition across the Belt") (1785) is an imitation, in twelve books, of Voltaire's *Henriade*, and deals with the prowess of Charles X. It is impossible to read it. He wrote fables, allegories, and satires. He outlived his chief contemporaries so long that the new generation addressed him as "Father Gyllenborg." Anders Odel (1718–1773) wrote in 1739 the famous "Song of Malcolm Sinclair," the *Sinclairsvisa*. The writers of verse in this period were exceedingly numerous, but it cannot be needful, in a sketch of this kind, to preserve the minor names.

In prose, as was to be expected, the first half of the 18th century was rich in Sweden as elsewhere. The first Swedish novelist was Jakob Henrik Mörk (1714–1763). His romances have some likeness to those of Richardson; they are moral, long-winded, and slow in evolution, but written in an exquisite style, and with much knowledge of human nature. *Adalrik och Göthilda*, which went on appearing from 1742 to 1745, is the best known; it was followed, between 1749 and 1758, by *Thecla*. Jakob Wallenberg (1746–1778) described a voyage he took to the East Indies and China under the very odd title of *Min Son på Galejan* ("My Son at the Galleys"), a work full of humour and originality. We have already indicated that Dalin's activity in prose was scarcely less abundant or less meritorious than that in verse. He wrote an important history of Sweden down to Charles IX. His contemporary Johan Ihre (1707–1780), a professor at Upsala, edited the *Codex Argenteus* of Ulfilas, and produced the first complete Swedish dictionary. In doing this he was assisted by the labours of two other grammarians, Sven Hof (d. 1786) and Abraham Sahlstedt (d. 1776). Karl Gustaf Tessin (1695–1770) wrote on politics and on æsthetics. Anders Johan von Höpken (1712–1789), the friend of Ulrica Eleonore, was a master of rhetorical compliment in addresses and funeral orations. In spite of all the encouragement of the court, drama did not flourish in Sweden. Among the tragedians of the age we may mention Dalin, Gyllenborg, and Erik Wrangel (d. 1765). In comedy Reinhold Gustaf Modée (d. 1752) wrote three good plays in rivalry of Holberg. In science Linnæus, or Karl von Linné (1707–1778), was the name of greatest genius in the whole century; but he wrote almost entirely in Latin. The two great Swedish chemists, Torbern Olof Bergman (1735–1784) and Karl Vilhelm Scheele (1742–1786), flourished at this time. In pathology a great name was left by Nils Rosén von Rosenstein (1706–1773), in navigation by Admiral Fredrik Henrik af Chapman (d. 1808), in philology by Karl Aurivillius (d. 1786). But these and other distinguished savants whose names might be enumerated scarcely belong to the history of Swedish literature. The same may be said about that marvellous and many-sided genius, Emanuel Swedenborg (1688–1772), who, though the son of a Swedish poet, preferred to prophesy to the world in Latin (see SWEDENBORG).

What is called the Gustavian period is supposed to commence with the reign of Gustavus III. in 1771 and to close with the abdication of Gustavus IV. in 1809. This period of less than forty years was particularly rich in literary talent, and the taste of the people in literary matters widened to a remarkable extent. Journalism began to develop; the Swedish Academy was founded; the drama first learned to flourish in Stockholm; and literature began to take a characteristically national shape. This fruitful period naturally divides itself into two divisions, equivalent to the reigns of the two kings. The royal personages of Sweden have commonly been protectors of literature; they have strangely often been able men of letters themselves. Gustavus III. (1746–1792), the founder of the Swedish Academy and of the Swedish theatre, was himself a playwright of no mean ability. One of his prose dramas, *Siri Brahe och Johan Gyllenstjerna*, held the stage for many years. In 1773 the king opened the national theatre in Stockholm, and on that occasion an opera of *Thetis och Pelée* was performed, written by himself. In 1786 Gustavus created the Swedish Academy, on the lines of the French Academy, but with eighteen members instead of forty. The first list of immortals, which included the survivors of a previous age and such young celebrities as Kellgren and Leopold, embraced all that was most brilliant in the best society of Stockholm; the king himself presided, and won the first prize for an oration. The principal writers of the reign of Gustavus III. bear the name of the Academical school. But we must first consider a writer of genius who had nothing academical in his composition.

Bellman

Karl Mikael Bellman (1740–1795), the most original and one of the most able of all Swedish writers, was an improvisatore of the first order (see BELLMAN). The riot of his dithyrambic hymns sounded a strange note of nature amid the conventional music of the Gustavians. Of the academical poets Johan Gabriel Oxenstjerna (1750–1818), the nephew of Gyllenborg, was a descriptive idyllist of grace. He translated *Paradise Lost*. A writer of far more power and versatility was Johan Henrik Kellgren (1751–1795), the leader of taste in his time (see KELLGREN).

Kellgren

He was the first writer of the end of the century in Sweden, and the second undoubtedly was Karl Gustaf af Leopold (1756–1829), "the blind seer Tiresias-Leopold," who lived on to represent the old school in the midst of romantic times.

Leopold

Leopold was not equal to Kellgren in general poetical ability, but he is great in didactic and satiric writing. He wrote a satire, the *Eneboniad*, against a certain luckless Per Enebom, and a classic tragedy of *Virginia*. He is little read now. Gudmund Göran Adlerbeth (1751–1818) was a translator, and the author of a successful tragic opera, *Cora och Alonzo* (1782). Anna Maria Lenngren (1754–1817) was a very popular sentimental writer of graceful verse, chiefly between 1792 and 1798. She was less French and more national than most of her contemporaries; she is a Swedish Mrs Hemans.

Two writers of the academic period, besides Bellman, and a generation later than he, kept apart, and served to lead up to the romantic revival **Lidner** Bengt Lidner (1759–1793), a melancholy and professedly elegiacal writer, had analogies with such German sentimentalists as Novalis He led a strange wandering life, and died, still young, in extreme poverty His poems appeared in 1788 **Thorild** Tomas Thorild (1759–1808) was a much stronger nature, and led the revolt against prevailing taste with far more vigour But he is an irregular and inartistic versifier, and it is mainly as a prose writer, and especially as a very original and courageous critic, that he is now mainly remembered He settled in Germany, and died as a professor in Greifswald Karl August Ehrensvard (1745–1800) may be mentioned here as a critic whose aims somewhat resembled those of Thorild The creation of the Academy led to a great production of æsthetic and philosophical writing Among critics of taste may be mentioned Nils von Rosenstein (1752–1824), the rhetorical bishop of Linkoping, Magnus Lehnberg (1758–1808), and Count Georg Adlersparre (1760–1809) Kellgren and Leopold were both of them important prose writers

The excellent lyrical poet Frans Mikael Franzén (1772–1847) (see FRANZEN), and a belated academician Johan David Valerius (1776–1852), fill up the space between the Gustavian period and the domination of romantic ideas from Germany **Hammarskold** It was Lorenzo Hammarskold (1785–1827) who in 1803 introduced the views of Tieck and Schelling by founding the society in Upsala called "Vitterhetens Vanner" (see HAMMARSKOLD) This passed away, but was succeeded in 1807 by the famous "Aurora forbundet," founded by two youths of genius, **Atterbom** Per Daniel Amadeus Atterbom (1790–1855) and Vilhelm Frederik Palmblad (1788–1852) These young men had at first to endure bitter opposition and ridicule from the academic writers then in power, but they supported this with cheerfulness, and answered back in their magazines, *Polyfem* and *Fosforos* (1810–1813) They were named "Fosforisterna" (Phosphorists) from the latter The principal members of the school were the three writers last named (see ATTERBOM) and Karl Frederik Dahlgren (1791–1844), a humorist who owed much to the example of Bellman Fru Julia Nyberg (1785–1854), under the title of Euphrosyne, was their tenth Muse, and wrote agreeable lyrics Among the Phosphorists Atterbom was the man of most genius On the side of the Academy they were vigorously attacked by Per Adam Wallmark (1777–1858) One of them, Atterbom, eventually forced the doors of the Academy itself

In 1811 certain young men in Stockholm founded a society for the elevation of society by means of the study of Scandinavian antiquity. **Gothic Society** This was the Gothic Society, which began to issue the magazine called *Iduna* as its organ Of its patriotic editors the most prominent was **Geijer** Erik Gustaf Geijer (1783–1847), but he was presently joined by a young man slightly older than himself, **Tegnér** Esaias Tegnér (1782–1846), afterwards bishop of Vexio, the greatest of Swedish writers (see GEIJER and TEGNÉR) Even more enthusiastic than either in pushing to its last extreme the worship of ancient myths and manners was Per Henrik Ling (1776–1839), now better remembered as the father of gymnastic science than as a poet The Gothic Society eventually included certain younger men than these—Arvid August Afzelius (1785–1871), the first editor of the Swedish folk-songs, Gustaf Vilhelm Gumælius (1789–1877), who has been somewhat pretentiously styled "The Swedish Walter Scott," author of the historical novel of *Tord Bonde*, Baron Bernhard von Beskow (1796–1868), lyrist and dramatist, and Karl August Nicander (1799–1839), a poet who approached the Phosphorists in manner The two great lights of the Gothic school are Geijer, mainly in prose, and Tegnér, in his splendid and copious verse **Wallin** Johan Olof Wallin (1779–1839) may be mentioned in the same category, although he is really distinct from all the schools He was archbishop of Upsala, and in 1819 he published the national hymn book of Sweden, now officially used in all churches, of the hymns in this collection, one hundred and twenty-six are written by Wallin himself

From 1810 to 1840 was the blossoming-time in Swedish poetry, and there were several writers of distinguished merit who could not be included in either of the groups enumerated above Second only to Tegner in genius, the brief life and mysterious death of **Stagnelius** Erik Johan Stagnelius (1793–1823) have given a romantic interest to all that is connected with his name His first publication was the epic of *Vladimir the Great* (1817), to this succeeded the romantic poem *Blanda* His singular dramas, *The Bacchantes* (1822), *Sigurd Ring*, which was posthumous, and *The Martyrs* (1821), are esteemed by many critics to be his most original productions His mystical lyrics, entitled *Liljor i Saron* ("Lilies in Sharon"), and his sonnets, which are the best in Swedish, may be recommended as among the most delicate products of the Scandinavian mind Stagnelius has been compared, and not improperly, to Shelley **Sjoberg** Erik Sjoberg, who called himself "Vitalis" (1794–1828), was another gifted writer whose career was short and wretched A volume of his poems appeared in 1820, they are few in number and all brief His work divides itself into two classes—the one profoundly melancholy, the other witty or boisterous Two humorous poets of the same period who deserve mention are Johan Anders Wadman (1777–1837), an improvisatore of the same class as Bellman, and Kristian Erik Fahlcrantz (1790–1866), bishop of Vesterås, whose humorous polemical poem of *Noah's Ark* (1825) is a masterpiece

Among the poets who have been mentioned above, the majority distinguished themselves also in prose But the period was not one in which Swedish prose shone with any special lustre The first prosaist of the time was, without question, the novelist **Almqvist** Karl Jonas Ludvig Almqvist (1793–1866), around whose extraordinary personal character and career a mythical romance has already collected (see ALMQVIST) He was encyclopædic in his range, although his stories preserve most charm, on whatever subject he wrote his style was always exquisite Frederik Cederborgh (1784–1835) revived the comic novel in his *Uno von Trasenberg* and *Ottar Tralling* The historical novels of Gumælius have already been alluded to Swedish history supplied themes for the romances of Count Per Georg Sparre (1790–1871) and of Gustaf Henrik Mellin (1803–1876) But all these writers sink **Fredrika Bremer** before the sustained popularity of the Finnish poetess Fredrika Bremer (1801–1865), whose stories have reached farther into the distant provinces of the world of letters than the writings of any other Swede except Tegnér (see BREMER) She was preceded by Sofia Zelow, afterwards Baroness von Knorring (1797–1848), who wrote a long series of aristocratic novels

At the beginning of the romantic period a high position was taken as an independent thinker by Benjamin Hoijer (1767–1812), who owed much at the outset to Kant and Fichte Geijer also distinguished himself in philosophical writing, but the most original of Swedish philosophers has been Kristofer Jakob Bostrom (1797–1866), a peripatetic talker, who wrote little, but whose system has been reduced to literature by K Claeson (1827–1859), Professor Axel Nyblæus (b 1821), and other disciples A polemical writer of great talent was Magnus Jakob

Crusenstolpe (1795–1865), of whose work it has been said that "it is not history and it is not fiction, but something brilliant between the one and the other" As an historian of Swedish literature Per Wieselgren (1800–1877) has composed a valuable work, and he has made other valuable contributions to history and bibliography In history we meet again with the great name of Geijer, with that of Jonas Hallenberg (1748–1834), and with that of Anders Magnus Strinnholm (1786–1862), whose labours in the field of Swedish history were extremely valuable Geijer and Strinnholm prepared the way for the most popular and perhaps the greatest of all Swedish historians, Anders Fryxell (1795–1881), whose famous *Berattelser ur Svenska Historien* appeared in parts during a space of nearly sixty years, an extraordinary example of persistent and uninterrupted work As a legal historian the first place is easily maintained by Karl Johan Schlyter (b 1795) Hans Jarta (1774–1847) was a statesman who wrote with vigour on economical subjects In science it is only possible to mention the celebrated names of Jons Jakob Berzelius (1779–1848) the chemist, Elias Fries (1794–1878) the botanist, Karl Adolf Agardh (1785–1859) the physiologist, and Sven Nilsson (1787–1883) the palæontologist

Runeberg In the generation which has just passed away, the first poet of Sweden, without a rival, was Johan Ludvig Runeberg (1804–1877), who divides with Tegnér the highest honour in Swedish literature (see RUNEBERG) The other leading verse-writers were Karl Vilhelm Bottiger (1807–1878), the son-in-law and biographer of Tegnér, Johan Borjesson (1790–1866), the last of the Phosphorists, author of various romantic dramas, Vilhelm August von Braun (1813–1860), a humorous lyrist, "Talis Qualis," whose real name was Karl Vilhelm August Strandberg (1818–1877), and August Teodor Blanche (1811–1868), the popular dramatist But Runeberg is the only great poetic name of this period In prose there was not even a Runeberg Novel-writing was sustained at no very high level by Karl Anton Wetterbergh (b 1804), who called himself "Onkel Adam," by Emilie Carlen (b 1807), whose autobiography has lately appeared, by Oskar Patrick Sturzen-Becker, "Orvar Odd," (1811–1869), by August Blanche, and by Marie Sofia Schwartz (b 1819) Lars Johan Hierta (1801–1872) was the leading journalist, Johan Henrik Thomander, bishop of Lund (1798–1865), the greatest orator, Matthias Alexander Castrén (1813–1852) a prominent man of science, and Karl Gustaf af Forsell (1783–1848) the principal statistician of this not very brilliant period Elias Lonnrot (1802–1884) is distinguished as the Finnish professor who discovered and edited the *Kalevala* It is impossible to give an exhaustive list of names in so short a sketch as this

Swedish literature is not in a very lively condition at the present time The most popular living poet is the Finn, Zakris Topelius (b 1818) Of a higher artistic merit are the finished lyrics of Count Karl Snoilsky (b 1841) King Oscar II (b 1829) is a genuine poet of the second order, as his father Charles XV was of the third Karl David af Wirsen (b 1842) is an active writer on the conservative side The best living author of Sweden is undoubtedly Viktor Rydberg (b 1829), who has written masterly novels and historical works The latest influences from Denmark and France are beginning to be represented by Strindberg the novelist, and by Fru A Ch Edgren, the most successful Swedish dramatist of the moment The revival of literature which has been so marked in the other two Scandinavian countries has not yet spread into Sweden

SWEDENBORG, or SVEDBERG, EMANUEL (1688–1772), was born at Stockholm January 29, 1688 His father, Dr Jesper Svedberg, subsequently professor of theology at Upsala and bishop of Skara, was a pious, learned, and a brave man, who did not escape the charge of heterodoxy, and believed himself to be in constant intercourse with angels Emanuel shared as a child his father's piety, and his parents thought that "angels spoke through him" His education embraced the Latin, Greek, and Hebrew languages, and, above all, mathematics with the natural sciences, but seems to have been curiously defective in theology Endowed with unusual intellectual powers and an iron constitution, he acquired vast stores of learning in all those branches Having completed his university course at Upsala, in 1710 he commenced the customary European tour, visiting England, Holland, France, and Germany studying especially natural philosophy, though alternating it with the composition of Latin verses, little of the poet as there was in his nature In 1715 he returned to Upsala, and devoted himself to natural science and various engineering works From 1716 to 1718 he published a scientific periodical, called *Dædalus Hyperboreus*, a record of mechanical and mathematical inventions and discoveries In 1716 he was introduced to Charles XII, who appointed him assessor in the Swedish college of mines Two years later he distinguished himself at the king's siege of Frederikshall by the invention of machines for the transport of boats and galleys overland from Stromstadt to Iddefjord, a distance of 14 English miles The same year he published various mathematical and mechanical works At the death of Charles XII Queen Ulrica elevated him and his family to the rank of nobility, by which his name was changed from Svedberg to Swedenborg The next years were devoted to the duties and studies connected with his office, which involved the visitation of the Swedish, Saxon, Bohemian, and Austrian mines In 1721 he was offered the chair of mathematics in the university of Upsala, which he declined Gradually his inquiring and philosophical mind led him to wider studies than those of his profession As early as 1721 he was seeking to lay the foundation of a scientific explanation of the universe, when he published his *Prodromus Principiorum Rerum Naturalium* and had already written his *Principia* in its first form Thirteen years later, in 1734, appeared in three volumes *Opera Philosophica et Mineralia*, the first volume of which (his *Principia*) contained his view of the first principles of the universe, a curious mechanical and geometrical theory of the origin of things The same year followed *Prodromus Philosophiæ ratiocinantis de Infinito et Causa Finali Creationis*, which treats of the relation of the finite to the infinite and of the soul to the body, seeking to establish a nexus in each case as a means of overcoming the difficulty of their relation From this time he applied himself to the problem of discovering the nature of soul and spirit by means of anatomical studies He travelled in Germany, France, and Italy in quest of the most eminent teachers and the best books dealing with the human frame, and published, as the results of his inquiries, among other works, his *Œconomia Regni Animalis* (London, 1740-41) and *Regnum Animale* (The Hague, 1744–45, London, 1745) But a profound change was coming over

him, which was to make of the scientific inquirer the supernaturalist prophet. Neither by geometrical, nor physical, nor metaphysical principles had he succeeded in reaching and grasping the infinite and the spiritual, or in elucidating their relation to man and man's organism, though he had caught glimpses of facts and methods which he thought only required confirmation and development. Late in life he wrote to Oetinger that "he was introduced by the Lord first into the natural sciences, and thus prepared, and, indeed, from the year 1710 to 1744, when heaven was opened to him." This latter great event is described by him as "the opening of his spiritual sight," "the manifestation of the Lord to him in person," "his introduction into the spiritual world." Before his illumination he had been instructed by dreams, and enjoyed extraordinary visions, and heard mysterious conversations. According to his own account, the Lord filled him with His spirit to teach the doctrines of the New Church by the word from Himself; He commissioned him to do this work, opened the sight of his spirit, and so let him into the spiritual world, permitting him to see the heavens and the hells, and to converse with angels and spirits for years; but he never received anything relating to the doctrines of the church from any angel but from the Lord alone while he was reading the word (*True Christian Religion*, No. 779). He elsewhere speaks of his office as principally an opening of the spiritual sense of the word. His friend Robsahm reports, from Swedenborg's own account to him, the circumstances of the first extraordinary revelation of the Lord, when He appeared to him and said, "I am God the Lord, the Creator and Redeemer of the world. I have chosen thee to unfold the spiritual sense of the Holy Scripture. I will Myself dictate to thee what thou shalt write." From that time he gave up all worldly learning, and laboured solely to expound spiritual things. But it was some time before he became quite at home in the spiritual world. In the year 1747 he resigned his post of assessor of the college of mines that he might devote himself to his higher vocation, requesting only to be allowed to receive as a pension the half of his salary. He took up afresh his study of Hebrew, and began his voluminous works on the interpretation of the Scriptures. The principal of these is the *Arcana Cœlestia* in eight quarto volumes, which he printed in London between 1749 and 1756, professing to have derived the whole of it by direct illumination from the Almighty Himself, and not from any spirit or angel. His later work *De Cœlo et de Inferno* (London, 1758) consists of extracts and portions of the *Arcana*. His MS work *Apocalypsis Explicata*, expounding the doctrines of the New Church, was prepared in 1757–59. In 1763 appeared his *Sapientia Angelica de Divino Amore et de Divina Sapientia*, containing the most philosophical brief account of the principles of the New Church. The long list of his subsequent writings will be found in the works mentioned below. His life from 1747 was spent alternately in Sweden, Holland, and London, in the composition of his works and their publication, till his death, which took place in London, March 29, 1772.

He was a man who won the respect, confidence, and love of all who came into contact with him. Though people might disbelieve in his visions, they feared to ridicule them in his presence. His manner of life was simple in the extreme; his diet consisted chiefly of bread and milk and large quantities of coffee. He paid no attention to the distinction of day and night, and sometimes lay for days together in a trance, while his servants were often disturbed at night by hearing what he called his conflicts with evil spirits. But his intercourse with spirits was often perfectly calm, in broad daylight, and with all his faculties awake. Three extraordinary instances are produced by his friends and followers in proof of his seership and admission into the unseen world. But there exists no account at first hand of the exact facts, and Swedenborg's own reference to one of these instances admits of another explanation than the supernatural one. The philosopher Kant was struck by them in 1763, but in 1765, after further inquiries, concluded that two of them had "no other foundation than common report (*gemeine Sage*)." See Kehrbach's edition of Kant's *Traume eines Geistersehers* (Leipsic, 1880).

Swedenborg's theosophic system is most briefly and comprehensively presented in his *Divine Love and Divine Wisdom*. The point of view from which God must be regarded is that of His being the Divine Man. His *esse* is infinite love; His manifestation, form, or body is infinite wisdom. Divine love is the self-subsisting life of the universe. From God emanates a divine sphere, which appears in the spiritual world as a sun, and from this spiritual sun again proceeds the sun of the natural world. The spiritual sun is the source of love and intelligence, or life, and the natural sun the source of nature, or the receptacles of life; the first is alive, the second dead. The two worlds of nature and spirit are perfectly distinct, but they are intimately related by analogous substances, laws, and forces. Each has its atmospheres, waters, and earths, but in the one they are natural and in the other spiritual. In God there are three infinite and uncreated "degrees" of being, and in man and all things corresponding three degrees, finite and created. They are love, wisdom, use, or end, cause, and effect. The final ends of all things are in the Divine Mind, the causes of all things in the spiritual world, and their effects in the natural world. By a love of each degree man comes into conjunction with them and the worlds of nature, spirit, and God. The end of creation is that man may have this conjunction and become the image of his Creator and creation. In man are two receptacles for God,—the will for divine love and the understanding for divine wisdom,—that love and wisdom flowing into both so that they become human. Before the fall this influx was free and unhindered, and the conjunction of man with God and the creation complete, but from that time the connexion was interrupted and God had to interpose by successive dispensations. At last the power and influence of the spirits of darkness, with whom man associates himself by his sin, became so great that the existence of the human race was threatened, and Jehovah was necessitated to descend into nature to restore the connexion between Himself and man. He could not come in His unveiled Divinity, for the "hells" would have then perished, whom he did not seek to destroy but only to subjugate. Another purpose of Jehovah's incarnation was the manifestation of His divine love more fully than ever before. Swedenborg wholly rejects the orthodox doctrine of atonement, and the unity of God, as opposed to his idea of the trinity of the church, is an essential feature of his teaching. Another distinctive feature is that Jehovah did not go back to heaven without leaving behind Him a visible representative of Himself in the word of the Scripture. This word is an eternal incarnation, with its threefold sense—natural, spiritual, celestial. And Swedenborg is the divinely commissioned expounder of this threefold sense of the word, and so the founder of the New Church, the paraclete of the last dispensation. That he might perceive and understand the spiritual and the celestial senses of the word he enjoyed immediate revelation from the Lord, was admitted into the angelic world, and had committed to him the key of "correspondences" with which to unlock the divine treasures of wisdom. Swedenborg claimed also to have learnt by his admission into the spiritual world the true states of men in the next life, the scenery and occupations of heaven and hell, the true doctrine of Providence, the origin of evil, the sanctity and perpetuity of marriage, and to have been a witness of the "last judgment," or the second coming of the Lord, which took place in the year 1757. It was then that the New Church, or the New Jerusalem, was inaugurated, and Swedenborg claimed to be the divinely appointed prophet and teacher of its doctrines, and maintained that his revelations excel all that preceded them.

Swedenborgianism.—Swedenborgianism, as professed by Swedenborg's followers, is based on the belief of Swedenborg's claims to have witnessed the last judgment, or the second advent of the Lord, with the inauguration of the New Church through the new system of doctrine promulgated by him and derived from the Scriptures, into the true sense of which he was the first to be introduced. The doctrines of the New Church are those of the internal sense of the word as revealed to Swedenborg, who received them into his understanding and published them through the press and not as a preacher. They are briefly—(1) that the Lord Jesus Christ is the only God, that in Him there is the Trinity of Father, Son, and Holy Ghost, the Father being His infinite divine nature or soul, the Son His glorified human nature or divine body, and the Holy Spirit the life proceeding from His divine humanity for the salvation of man; (2) that the Father in His eternal humanity descended as the Lord Jesus Christ to the earth, assuming fallen human nature, that in it he might conquer hell and deliver mankind from its influence; (3) that the Sacred Scriptures are the true word of God, accommodated to the understanding of angels and men, and constituting the perpetual medium between heaven and the church, the law of correspondence having been revealed by the Lord to Swedenborg as the key for their interpretation; (4) that man is not saved by faith alone but by a life according to the word, the summary of which is the decalogue; (5) that heaven is made up of those who

keep God's commandments and love Him and His kingdom, and hell of those who love themselves and the world, (6) that the spiritual world—heaven and hell—holds the same relation to the natural world and its inhabitants as the soul to the body, being in and around the natural world and its life, and that after the death of the body the spirit continues to live in the spiritual world it had previously though unconsciously inhabited. Swedenborgians now constitute a widely spread and considerable society, with a regularly constituted ecclesiastical organization and a zealous missionary activity. Soon after Swedenborg's death students of his works in England and Sweden began to translate them from the Latin and to spread his views. First in time and activity amongst these early Swedenborgians was the Rev. John Clowes, rector of St John's, Manchester, who translated the whole of several treatises. The first public meeting of Swedenborgians, from which dates the foundation of the society, was held in London December 5, 1783, and was attended by five persons. The separation of the society from the "old church" as a religious body, with its distinct creed, worship, and ecclesiastical organization, took place May 7, 1787, and its first place of worship was in Great Eastcheap, London. The first general conference of the New Church was held April 17, 1789, in this chapel, when a series of resolutions concerning the creed, the sacraments, and ecclesiastical order of the society were adopted. At the same time churches began to be formed in various towns in England and in America. Towards the end of the century Swedenborg's doctrines obtained a considerable degree of acceptance on the Continent, separate societies having arisen here and there. Meantime the Manchester Printing Society, under Mr Clowes, printed and distributed Swedenborg's works in large numbers. In 1810 a London Printing Society was formed, which has been very active in the same way to the present time. In 1817 a convention of the American New Church was held in Philadelphia, which gave proof of the growth of the body in the United States. The same year the tenth general conference of the English section of the church was attended by twenty seven delegates and ministers of various societies, and in 1821 there were upwards of fifty two of these in Great Britain. At the general conference in 1885 it was reported that there were sixty-five societies or churches in Great Britain connected with the conference, having 5700 registered members, the net increase of the year being 119. The names of thirty two ordained ministers appear in the report, the investments of the society amount to £60,453, and there are a dozen educational and missionary institutions in connexion with it. Some of the New Church day schools are amongst the largest and most efficient in the kingdom. From the same report it appears that the New Church has societies or institutions in most British colonies as well as in the principal countries of Europe. The report of the General Convention of the New Jerusalem in the United States, 1885, gives the names of 116 societies in America, with nearly the same number of ordinary ministers. In Italy, Sweden, and Prussia there is a Swedenborg mission sustained by help from England and America. In South Germany there exist congregations of the New Church, and the librarian of the university of Tubingen, Dr Immanuel Tafel, was exceedingly active until his death (1863) in the publication and translation of Swedenborg's works, and in the vindication of the doctrines of the New Church. In Austria, Norway, and Switzerland also there are congregations. But, in addition to full converts to Swedenborgianism, a considerable number of prominent theologians and other thinkers have been attracted by Swedenborg's works and parts of his system. While the extravagant anthropomorphism, the mechanical materialism, the theological narrowness, the wild allegorizing, the entire absence of historical knowledge, and the astounding prophetic claims of the man and his system,—in a word, the Gnosticism of Swedenborg and his followers,—must be offensive to philosophical minds, they can discover in his writings and the drift of his thought fine ethical views, profound glances of insight into the depths of the universe,—God, nature, man, and his destiny. The names of Oetinger, Herder, Goerres, Coleridge, Emerson, J. D. Morell may be given as proof of this. Such thinkers were attracted by one or more of the dominant and pervading principles or tendencies of his extraordinary mind. For he felt, if he did not adequately expound, the harmony of the universe, the fundamental unity of being and thought, of knowledge and will, of the divine and the human; and his wild system of allegory, with his equally wild communications with the unseen world, failed to conceal a deep moral and intellectual revolt against the most irrational forms of traditional orthodoxy, while his deep spiritual nature spurned the shallow intellectualism of the rationalists of the 18th century.

Literature.—A rich collection of materials for a life of Swedenborg is *Documents concerning the Life and Character of Swedenborg, Collected, Translated, and Annotated*, by Dr R. L. Tafel, in 3 vols., Swedenborg Society, 1875-77. Of English lives the principal are—*Emanuel Swedenborg, a Biography*, by J. J. G. Wilkinson, London, 1849; *Swedenborg, a Biography and an Exposition*, by E. Paxton Hood, London, 1854; *Swedenborg, his Life and Writings*, by William White, 1856, rewritten in 1867 and in 1868; *Emanuel Swedenborg, the Spiritual Columbus, a Sketch*, by U. S. E., 2d ed., London, 1877. A useful handbook of Swedenborg's theology, consisting of extracts in English from his numerous works, is the *Compendium of the Theological Writings of Emanuel Swedenborg*, by the Rev. Samuel Warren, London, 1885. Brief summaries of his system and writings are given in all the above biographies and in Edmund Swift's *Manual of the Doctrines of the New Church*, London, 1885. Important critiques from independent points of view are "Emanuel Swedenborg," in the *Prospective Review*, May 1850; "The Mystic," in Emerson's *Representative Men*, 1850; Kant's *Träume eines Geistersehers*, 1766 (the best edition by Kehrbach, Leipsic, 1880); Herder's "Emanuel Swedenborg," in his *Adrastea* (*Werke zur Phil. und Gesch.*, vol. xii. pp. 110-125); Goerres's *Emanuel Swedenborg, seine Visionen und sein Verhaltniss zur Kirche*, 1827; Dorner's *Gesch. d. Prot. Theol.*, Munich, 1867, pp. 662-67. For the history of Swedenborgianism, see *Rise and Progress of the New Jerusalem Church in England, America, and other Parts*, by Robert Hindmarsh, edited by E. Madeley, London, 1861. The chief apologetic work is Noble's *Appeal*, 10th ed. 1881, London. See also *National Review*, April 1858. (J. F. S.)

SWEET POTATO. See POTATO.

SWIFT, a bird so called from the extreme speed of its flight, which apparently exceeds that of any other British species, the *Hirundo apus* of Linnæus and *Cypselus apus* or *murarius* of modern ornithologists, who have at last learned that it has only an outward resemblance but no near affinity to the SWALLOW (*ante*, p. 729) or its allies. Well known as a summer-visitor throughout the greater part of Europe, it is one of the latest to return from Africa, and its stay in the country of its birth is of the shortest, for it generally disappears from England very early in August, though occasionally to be seen for even two months later.

The Swift commonly chooses its nesting place in holes under the eaves of buildings, but a crevice in the face of a quarry, or even a hollow tree, will serve it with the accommodation it requires. This indeed is not much, since every natural function, except sleep, oviposition, and incubation, is performed on the wing, and the easy evolutions of this bird in the air, where it remains for hours together, are the admiration of all who witness them. Though considerably larger than a Swallow, it can be recognized at a distance less by its size than by its peculiar shape. The head scarcely projects from the anterior outline of the pointed wings, which form an almost continuous curve, at right angles to which extend the body and tail, resembling the handle of the crescentic cutting-knife used in several trades, while the wings represent the blade. The mode of flight of the two birds is also unlike, that of the Swift being much more steady, and, rapid as it is, ordinarily free from jerks. The whole plumage, except a greyish-white patch under the chin, is a sooty black, but glossy above. Though its actual breeding places are by no means numerous, its extraordinary speed and discursive habits make the Swift widely distributed, and throughout England scarcely a summer's day passes without its being seen in most places. A larger species, *C. melba* or *C. alpinus*, with the lower parts dusky white, which has its home in many of the mountainous parts of central and southern Europe, has several times been observed in Britain, and two examples of a species of a very distinct genus, *Acanthyllis* (or *Chætura*), which has its home in northern Asia, but regularly emigrates thence to Australia, have been obtained in England (*Proc. Zool. Society*, 1880, p. 1).[1]

Among other peculiarities the Swifts, as long ago described (probably from John Hunter's notes) by Home (*Phil. Trans.*, 1817, pp. 332 *et seqq.*, pl. xvi.), are remarkable for the development of their salivary glands, the secretions of which serve in most species to glue together the materials of which the nests are composed, and in the species of the genus *Collocalia* form almost the whole substance of the structure. These are the "edible" nests so eagerly sought by Chinese epicures as an ingredient for soup, and their composition, though announced many years since by Home (*ut supra*), whose statement was confirmed by Bernstein (*Act. Soc. Sc. Indo-Neerlandicæ*, iii. Art. 5, and *Journ. für Ornithologie*, 1859, pp. 111-119), has of late been needlessly doubted in favour of the popular belief that they were made of some kind of sea-weed, *Algæ*, or other vegetable matter collected by the birds.[2] It may be hoped that the examination and analysis made by Mr J. R. Green (*Journal of Physiology*, vi. pp. 40-45) have settled that question for all time. These remarkable nests consist essentially of mucus, secreted by the salivary glands above mentioned, which dries and looks like isinglass. Their marketable value depends on their colour and purity, for they are often intermixed with feathers and other foreign substances. The Swifts that construct these "edible" nests form a genus *Collocalia*, of which the number of species is uncertain, but they inhabit chiefly the islands of the Indian Ocean from the north of Madagascar eastward, as well as many of the tropical

[1] This species, *A. caudacuta*, has been generally, but Mr Hume says (*Stray Feathers*, ix. p. 230) wrongly, identified with the *Hirundo ciris* of Pallas. So many authors have recently ascribed the foundation of the genus *Chætura* to Stephens in the year 1825 that it may not be amiss to state that its origin dates only from 1826, the same year in which Boie established the commensurate genus *Acanthyllis*.

[2] Hence one species has been called *Collocalia fuciphaga*.

islands of the Pacific so far as the Marquesas,—one species occurring in the hill country of India They breed in caves, to which they resort in great numbers, and occupy them jointly and yet alternately with Bats—the mammals being the lodgers by day and the birds by night [1]

The genus *Cypselus*, as noted by Willughby, with its American ally *Panyptila*, exhibits a form of pedal structure not otherwise observed among birds Not only is the hind-toe constantly directed forwards, but the other three toes depart from the rule which ordinarily governs the number of phalanges in the Bird's foot,—a rule which applies to even so ancient a form as *Archæopteryx* (see BIRDS, vol iii p 728),—and in the two Cypseline genera just named the series of digital phalanges is 2, 3, 3, 3, instead of 2, 3, 4, 5, which generally obtains in the Class *Aves* Other Swifts, however, do not depart from the normal arrangement, and the exception, remarkable as it is, must not be taken as of more value than is needed for the recognition of two sections or subgenera admitted by Mr Sclater in his monographical essay on the Family (*Proc Zool Society*, 1865, pp 593–617) There seem to be about half a dozen good genera of *Cypselidæ*, and from fifty to sixty species Their geographical distribution is much the same as that of the *Hirundinidæ* (*cf* SWALLOW, *ut supra*), but it should be always and most clearly borne in mind that, though so like Swallows in many respects, the Swifts have scarcely any part of their structure which is not formed on a different plan, and, instead of any near affinity existing between the two groups, it can scarcely be doubted by any unprejudiced investigator that the *Cypselidæ* not only differ far more from the *Hirundinidæ* than the latter do from any other Family of *Passeres*, but that they belong to what in the present state of ornithology must be deemed a distinct Order of Birds—that which in the present series of articles has been called *Picariæ* That the relations of the *Cypselidæ* to the *Trochilidæ* (*cf* HUMMING-BIRD, vol. xii pp 357 *sq*) are close, as has been asserted by L'Herminier and Nitzsch, Dr Burmeister and Prof Huxley, is denied by Dr Shufeldt (*Proc Zool Society*, 1885, pp 886–914), but the views of the last have since been controverted by Mr F Lucas (*Auk*, 1886, pp 444–451) (A N)

wift's arly ears

SWIFT, JONATHAN (1667–1745), dean of St Patrick's, the greatest satirist of his own or perhaps of any age, was born in Hoey's Court, Dublin, November 30, 1667 Like Pope's, his family was of Yorkshire origin, in the time of Charles I the representative of one branch had obtained a peerage, which expired with him The first of his own immediate ancestors known to us was a clergyman, rector of St Andrew's, Canterbury, from 1569 to 1592, whose son succeeded him in that living, and whose grandson was the Rev Thomas Swift, vicar of Goodrich in Herefordshire, renowned for his eccentricity, his mechanical ingenuity, and, above all, his stubborn devotion to Charles I and the persecutions he underwent in consequence Plundered thirty-six times, and ultimately ejected from his living, he died in 1658, leaving his thirteen children a small and greatly impoverished landed estate and the questionable advantage of a substantial claim on the gratitude of the restored sovereign More fortunate than most ruined cavaliers, his eldest son Godwin soon obtained the attorney-generalship of the palatinate of Tipperary. This piece of good fortune naturally attracted other members of the family across the channel,—among them Jonathan, one of the youngest of nine brothers, but already husband of Abigail Ericke of Leicester, a lady of ancient descent and means more limited than his own A student of law, but never called to the bar, Jonathan appears to have subsisted for some years on windfalls and casual employments At length (1665) he became steward of the King's Inns (answering to the Inns of Court in England), an office of small emolument Two years afterwards he died suddenly, leaving an infant daughter and a widow pregnant with the future dean of St Patrick's So embarrassed had his circumstances been that, although considerable debts were owing to the estate, Mrs Swift was for the moment unable to pay the expense of his interment Thus Swift's first experience of life was that of a dependant on the charity of his uncles, more particularly of Godwin, and the inevitable bitterness of the situation was aggravated by the grudging manner in which the Tipperary official seemed to dole out his parsimonious help In fact, the apparently prosperous relative was the victim of unfortunate speculations, and chose rather to be reproached with avarice than with imprudence A virulent resentment became ingrained into the youth's whole nature, and, though ultimately acquainted with the real state of the case, he never mentioned his uncle with kindness or respect. Other relatives did more to merit his regard Yet he took no pride in his Irish connexions or nativity, and a singular adventure in his infancy seems to have afforded him a pretext for insinuating that he was really born in England When he was but two years old his nurse, a native of Whitehaven, was recalled to that town by an illness in her family So attached had she become to her charge as to clandestinely carry him away with her. Mrs Swift was induced to consent to his remaining with her for a time, and the child spent three years in Cumberland By his return his education had made considerable progress, and in the next year he was sent to the grammar school at Kilkenny There can be no question as to the author of *Gulliver* having been a remarkable child, but unfortunately only one anecdote of his school-days has been preserved It is the story, graphically narrated by himself, of his having once invested the whole of his pocket money in the purchase of an old horse condemned to the knacker's yard, his momentary triumph over his school-fellows, and his mortification on discovering the uselessness of his acquisition,—an anecdote highly characteristic of his daring pride and ambition, and from which, instead of the moral he professed to discover, he might have derived an augury of the majestic failure of his life

In April 1682 Swift matriculated at Trinity College, Dublin, where he failed to distinguish himself. "By the ill-treatment of his nearest relations," he says, meaning especially his uncle Godwin, "he was so discouraged and sunk in his spirits that he too much neglected his academic studies, for some part of which he had no great relish by nature, so that when the time came for taking his degree as bachelor of arts he was stopped of his degree for dulness and insufficiency, and at last hardly admitted in a manner little to his credit, which is called in that college *speciali gratia*, February 15, 1685" The college roll, nevertheless, shows that the only subject in which Swift absolutely failed was natural philosophy, including mathematics, in which the future author of the *Voyage to Laputa* was hardly likely to excel, nor is it surprising that a student of fitful and unruly temperament should have performed his obligatory theme *negligenter* His examination in Greek and Latin was satisfactory, and the extent of desultory information evinced by his writings seems to prove that he had always been an industrious reader. His mortification made him reckless, and he repeatedly underwent academic censure during the next three years, though it is not certain whether some of the records supposed to apply to him do not in fact relate to his cousin Thomas.

[1] Mr H Pryer has given one of the latest accounts of some of these caves in North Borneo (*Proc Zool Society*, 1885, pp. 532–538), which may be read to advantage

Swift and Temple

In 1688 Swift quitted the university, and, after a brief residence with his mother at Leicester, entered the family of Sir William Temple at Moor Park, near Farnham, as he declares for the advantage of Temple's conversation, but at least partly as an amanuensis. A distant relationship between his mother and Lady Temple appears to have recommended him to this post, which he found trying to his pride and independence. Temple was, as Swift admitted, "a man of sense and virtue," but his temper was exclusive, his manners formal, and he had retired from public affairs from self regard and over-fastidiousness. If he solaced his voluntary ostracism by a comparison with the elegant retirement and lettered ease of Cicero, it did not therefore occur to him to compare his obscure Irish secretary with the Roman orator's amanuensis Tiro, who had, at least, invented shorthand. We, who know that in the patron's place the dependant would have governed the nation, need not be surprised at finding, full twenty years afterwards, the iron of servitude still rankling in the latter's haughty soul. He withdrew from Temple's service on a pretext of ill health from May 1690 to August 1691, but returned, and undoubtedly made himself useful to his employer, who on one occasion rendered him the medium of a confidential communication to King William, who had consulted Temple on the bill for triennial parliaments, then sanctioned by both branches of the legislature. Swift did his best to enforce Temple's arguments in favour of the measure, and was in after life wont to refer to the failure of his rhetoric as the most useful lesson his vanity had ever received. Struck, it would seem, rather by the physical than the mental endowments of the robust young Irishman, William offered him a troop of horse, a proposal which appears to have been subsequently commuted into a promise of church preferment. Swift had already (July 1692) proceeded to the degree of M.A. at Oxford, and the execution of his design to embrace the ecclesiastical profession was hastened by a quarrel with Temple, occasioned by the latter's reluctance to contract any definite engagement to provide for him. Throwing up his employment, he passed (May 1694) over into Ireland, but found his views impeded by the refusal of all the bishops to ordain him without some certificate of the regularity of his deportment while in Temple's family. Five months passed ere he could bring himself to solicit this favour from his old patron, which he ultimately did in a letter submissive in appearance, but charged to the full with smothered rage and intense humiliation. Forgiveness was easy to one in Temple's place and of Temple's disposition, and he not only despatched the requisite testimonials, but added a recommendation which obtained for Swift the living of Kilroot, in the diocese of Down and Connor (January 1695). His residence here was not fated to be of long duration. Temple, who knew his value and had not parted with him willingly, soon let him understand that a return was open to him, and Swift, whose resentment was cooled by time, and soothed by the acknowledgment of his value to his patron, readily complied (May 1696). He continued to reside with Sir William till the latter's death in January 1699. No further disagreement troubled their intimacy, and Temple bequeathed Swift the charge of editing his writings, a laborious but not an unprofitable commission.

Early writings and settlement in Ireland

Macaulay has justly indicated the familiarity with public affairs acquired by Swift at Moor Park as one main cause of his subsequent distinction as a politician, and here too he laid the foundation of his literary renown. He is reported to have read regularly for eight hours every day, and we have his own authority for his having, as early as 1691, "written and burned, and written again, more on all manner of subjects than perhaps any man in England." The only relics of these early days, however, belong to a species of composition in which he was little qualified to excel. He has, indeed, a name among the poets of England, but the merit of his verse is usually in the ratio of its approach to the *sermo pedestris*. Mistaking the nature of his powers, he must needs begin with Pindarics, and the result may be imagined. Yet his own simple account of his feelings while endeavouring composition proves that the mood was right though the channel was wrong, and that there was error as well as truth in his kinsman Dryden's severe and unforgiven remark, "Cousin Swift, you will never be a poet." Swift's first prose composition betrayed his resentment. In the *Battle of the Books* (1697), a satirical contribution to the controversy on the comparative merits of the ancients and the moderns raised by Perrault, but with especial reference to the question of the genuineness of the letters of Phalaris, on which his patron Temple had taken the wrong side, Swift for the first and last time committed a plagiarism, and sought to conceal it by an untruth. It is undoubtedly adapted, though certainly improved from, De Callières's *Histoire Poëtique de la Guerre nouvellement déclarée entre les Anciens et les Modernes*. Here also his sarcasm for the first and last time recoiled upon himself. The satire against Dryden and Bentley wants, indeed, nothing but truth to be excellent, but the pictures of the former in his monstrous helmet and the latter in his patchwork mail yield in ludicrousness to the idea of the author of the *Pindaric Odes* presuming to ridicule the author of *Absalom and Achitophel*, and the inglorious student of Trinity College, Dublin, challenging the first philologist of the age on a question of classical scholarship. It is, however, to his credit that his learning was greater than that of the other writers on his side and his pretensions less. Swift's next literary labour was his edition of Temple's posthumous works, already mentioned. They appeared with a dedication to King William, which was to have made the editor a prebendary. A petition to this effect miscarried, as he always believed, through the negligence or ill-will of the nobleman who undertook to present it. Be this as it may, he had become too important to be overlooked, and soon obtained the post of secretary and chaplain to Earl Berkeley, one of the lords justices of Ireland. The better half of this appointment, however, escaped him on his arrival in that country, his secretaryship being transferred to a Mr Bushe, who, when Lord Berkeley had at length an opportunity of recompensing Swift's disappointment by the gift of the deanery of Derry, successfully excited his influence in favour of another clergyman, who is asserted to have gained his interest by the judicious outlay of a thousand pounds. With bitter indignation Swift threw up his chaplaincy, but was ultimately reconciled to his patron by the presentation to the rectory of Agher, in Meath, with the united vicarages of Laracor and Rathbeggan. For the first time in his life he might now call himself his own master, and had an opportunity of exhibiting, free from suspicion of external constraint, that stern regard to duty which was not the least prominent feature of his character. In an age of general laxity—in a priest of an alien church, whose most energetic servants commonly succumbed to the mortifying conviction of their uselessness and the detestation they excited among the people for whom they laboured, the parishioners of Laracor found a clergyman whom they might have heard three times a week. The energy, however, which probably gained the respect, certainly failed to influence the convictions, of his Catholic flock. We have his own authority for reckoning his average congregation at "half a score", and on one occasion his clerk Roger was his only auditor. In fact, his exertions in the pulpit were more meritorious than his achievements; he entirely lacked the fire, the self-oblivion, the expansive

geniality of the orator He himself characterized his discourses as "pamphlets," and, if meant to imply their arid and argumentative character, the criticism is just The author of the *Tale of a Tub,* which he had had by him since 1696 or 1698, must have felt conscious of powers capable of far more effective exercise, and his resolution to exchange divinity for politics must appear fully justified on a comparison of these inconclusive essays with another performance of the same period The *Discourse on the Dissensions in Athens and Rome* (September 1700), written in the Whig interest, "without humour and without satire," and intended as a dissuasive from the pending impeachment of Somers and three other noblemen, received the honour, extraordinary for the maiden publication of a young politician, of being generally attributed to Somers himself or to Burnet, the latter of whom found a public disavowal necessary Three years and a half later appeared a more remarkable work Clearness, cogency, masculine simplicity of diction, are conspicuous in the pamphlet, but true creative power told the *Tale of a Tub* "Good God! what a genius I had when I wrote that book!" was his own exclamation in his latter years It is, indeed, if not the most amusing of Swift's satirical works, the most strikingly original, and the one in which the compass of his powers is most fully displayed In his kindred productions he relies mainly upon a single element of the humorous,—logical sequence and unruffled gravity bridling in an otherwise frantic absurdity, and investing it with an air of sense In the *Tale of a Tub* he lashes out in all directions The humour, if less cogent and cumulative, is richer and more varied, the invention too, is more daringly original and more completely out of the reach of ordinary faculties The supernatural coats and the quintessential loaf may be paralleled but cannot be surpassed, and the book is throughout a mine of suggestiveness, as, for example, in the anticipation of Carlyle's clothes philosophy within the compass of a few lines At the same time it wants unity and coherence, it attains no conclusion, and the author abuses his digressive method of composition and his convenient fiction of hiatuses in the original manuscript The charges it occasioned of profanity and irreverence were natural, but groundless There is nothing in the book inconsistent with Swift's professed and real character as a sturdy Church of England parson, who accepted the doctrines of his church as an essential constituent of the social order around him, battled for them with the fidelity of a soldier defending his colours, and held it no part of his duty to understand, interpret, or assimilate them

Whig connexions; pamphlets on the church

Before the publication of the *Tale of a Tub*, Swift had taken a step destined to exercise a most important influence on his life, by inviting two ladies to Laracor Esther Johnson, a dependant of Sir William Temple's (born in March 1681), whose acquaintance he had made in the latter's family, and whom he has immortalized as "Stella,"[1] came over with her chaperon, Mrs Dingley, and was soon permanently domiciled in his neighbourhood The melancholy tale of Swift's attachment will be more conveniently narrated in another place, and is only alluded to here for the sake of chronology Meanwhile the sphere of his intimacies was rapidly widening He had been in England for three years together, 1701 to 1704, and counted Pope, Steele, and Addison among his friends The success of his pamphlet gained him ready access to all Whig circles, but already his confidence in that party was shaken, and he was beginning to meditate that change of sides which has drawn down upon him so much but such unjustifiable obloquy The true state of the case may easily be collected from his next publications—*The Sentiments of a Church of England Man*, and *On the Reasonableness of a Test* (1708) The vital differences among the friends of the Hanover succession were not political, but ecclesiastical From this point of view, Swift's sympathies were entirely with the Tories As a minister of the church he felt his duty and his interest equally concerned in the support of her cause, nor could he fail to discover the inevitable tendency of Whig doctrines, whatever caresses individual Whigs might bestow on individual clergymen, to abase the Establishment as a corporation He sincerely believed that the ultimate purpose of freethinkers was to escape from moral restraints, and he had an unreasoning antipathy to Scotch Presbyterians and English Dissenters One of his pamphlets, written about this time contains his recipe for the promotion of religion, and is of itself a sufficient testimony to the extreme materialism of his views Censorships and penalties are among the means he recommends His pen was exerted to better purpose in the most consummate example of his irony, the *Argument against Abolishing Christianity* About this time, too (November 1707), he produced his best poem, *Baucis and Philemon*, which, as he frankly tells us, owes very much to the corrections of Addison

Swift joins the Tories actively a ministerial writer

From February 1708 to April 1709 Swift was in London, urging upon the Godolphin administration the claims of the Irish clergy to the first-fruits and tenths ("Queen Anne's bounty"), already granted to their brethren in England His having been selected for such a commission shows that he was not yet regarded as a deserter from the Whigs, although the ill-success of his representations probably helped to make him one By November 1710 he was again domiciled in London, and writing his *Journal to Stella*, that unique exemplar of a giant's playfulness, "which was written for one person's private pleasure and has had indestructible attractiveness for every one since" In the first pages of this marvellously minute record of a busy life we find him depicting the decline of Whig credit and complaining of the cold reception accorded him by Godolphin, whose penetration had doubtless detected the precariousness of his allegiance Within a few weeks he had become the lampooner of the fallen treasurer, the bosom friend of Oxford and Bolingbroke, and the writer of the *Examiner*, a journal established as the exponent of Tory views (November 1710) He was now a power in the state, the intimate friend and recognized equal of the first writers of the day, the associate of ministers on a footing of perfect cordiality and familiarity "We were determined to have you," said Bolingbroke to him afterwards, "you were the only one we were afraid of" He gained his point respecting the Irish endowments, and, by his own account, his credit procured the fortune of more than forty deserving or undeserving clients The envious but graphic description of his demeanour conveyed to us by Bishop Kennet attests the real dignity of his position no less than the airs he thought fit to assume in consequence The cheerful, almost jovial, tone of his letters to Stella evinces his full contentment, nor was he one to be moved to gratitude for small mercies He had it, in fact, fully in his own power to determine his relations with the ministry, and he would be satisfied with nothing short of familiar and ostentatious equality His advent marks a new era in English political life, the age of public opinion, created indeed by the circumstances of the time, but powerfully fostered and accelerated by him By a strange but not unfrequent

[1] The name "Stella" is simply a translation of Esther Swift may have learned that Esther means "star" from the *Elementa Linguæ Persicæ* of John Greaves or from some Persian scholar, but he is more likely to have seen the etymology in the form given from Jewish sources in Buxtorf's *Lexicon*, where the interpretation takes the more suggestive form "Stella Veneris"

irony of fate the most imperious and despotic spirit of his day laboured to enthrone a power which, had he himself been in authority, he would have utterly detested and despised For a brief time he seemed to resume the whole power of the English press in his own pen and to guide public opinion as he would His services to his party as writer of the *Examiner*, which he quitted in July 1711, were even surpassed by those which he rendered as the author of telling pamphlets, among which *The Conduct of the Allies* and *Remarks on the Barrier Treaty* (November and December 1711) hold the first rank In truth, however, he was lifted by the wave he seemed to command Surfeited with glory, the nation wanted a convenient excuse for relinquishing a burdensome war, which the great military genius of the age was suspected of prolonging to fill his pockets The Whigs had been long in office The High Church party had derived great strength from the Sacheverell trial Swift did not bring about the revolution with which, notwithstanding, he associated his name There seems no reason to suppose that he was consulted respecting the great Tory strokes of the creation of the twelve new peers and the dismissal of Marlborough (December 1711), but they would hardly have been ventured upon if *The Conduct of the Allies* and the *Examiners* had not prepared the way A scarcely less important service was rendered to the ministry by his *Letter to the October Club*, artfully composed to soothe the impatience of Harley's extreme followers He had every claim to the highest preferment that ministers could give him, but his own pride and prejudice in high places stood in his way

Swift made dean of St Patrick's, fall of the Tory ministry

Generous men like Oxford and Bolingbroke cannot have been unwilling to reward so serviceable a friend, especially when their own interest lay in keeping him in England Notwithstanding, therefore, some dubious expressions in Swift's letters, natural to the deferred hope, we need not doubt their having actually used their best efforts to obtain for him the vacant see of Hereford Swift, however, had formidable antagonists in the archbishop of York, whom he had scandalized, and the duchess of Somerset, whom he had satirized Anne was particularly amenable to the influence of priestly and female favourites, and it must be considered a proof of the strong interest made for Swift that she was eventually persuaded to appoint him to the deanery of St Patrick's, Dublin, vacant by the removal of Bishop Sterne to Dromore It is to his honour that he never speaks of the queen with resentment or bitterness In June 1713 he set out to take possession of his dignity, and encountered a very cold reception from the Dublin public The dissensions between the chiefs of his party speedily recalled him to England He found affairs in a desperate condition The queen's demise was evidently at hand, and the same instinctive good sense which had ranged the nation on the side of the Tories, when Tories alone could terminate a fatiguing war, rendered it Whig when Tories manifestly could not be trusted to maintain the Protestant succession In any event the occupants of office could merely have had the choice of risking their heads in an attempt to exclude the elector of Hanover, or of waiting patiently till he should come and eject them from their posts, yet they might have remained formidable could they have remained united To the indignation with which he regarded Oxford's refusal to advance him in the peerage the active St John added an old disgust at the treasurer's pedantic and dilatory formalism, as well as his evident propensity, while leaving his colleague the fatigues, to engross for himself the chief credit of the administration Their schemes of policy diverged as widely as their characters Bolingbroke's brain teemed with the wildest plans, which Oxford might have more effectually discountenanced had he been prepared with anything in their place Swift's endeavours after an accommodation were as fruitless as unremitting His mortification was little likely to temper the habitual virulence of his pen, which rarely produced anything more acrimonious than the attacks he at this period directed against Burnet and his former friend Steele One of his pamphlets against the latter (*The Public Spirit of the Whigs*) was near involving him in a prosecution, some invectives against the Scots having proved so exasperating to the peers of that nation that they repaired in a body to the queen to demand the punishment of the author, of whose identity there could be no doubt, although, like all Swift's writings, except the *Proposal for the Extension of Religion*, the pamphlet had been published anonymously The immediate withdrawal of the offensive passage, and a sham prosecution instituted against the printer, extricated Swift from his danger

Meanwhile the crisis had arrived, and the discord of Oxford and Bolingbroke had become patent to all the nation Foreseeing, as is probable, the impending fall of the former, Swift retired to Upper Letcombe, in Berkshire, and there spent some weeks in the strictest seclusion This leisure was occupied in the composition of his remarkable pamphlet, *Free Thoughts on the State of Public Affairs*, which indicates his complete conversion to the bold policy of Bolingbroke The utter exclusion of Whigs as well as Dissenters from office, the remodelling of the army, the imposition of the most rigid restraints on the heir to the throne,—such were the measures which, by recommending, Swift tacitly admitted to be necessary to the triumph of his party If he were serious, it can only be said that the desperation of his circumstances had momentarily troubled the lucidity of his understanding, if the pamphlet were merely intended as a feeler after public opinion, it is surprising that he did not perceive how irretrievably he was ruining his friends in the eyes of all moderate men Bolingbroke's daring spirit, however, recoiled from no extreme, and, fortunately for Swift, he added so much of his own to the latter's MS that the author was obliged to recall a production which might not improbably have cost him his liberty and his deanery This incident but just anticipated the revolution which, after Bolingbroke had enjoyed a three days' triumph over Oxford, drove him into exile and prostrated his party, but enabled Swift to perform the noblest action of his life Almost the first acts of Bolingbroke's ephemeral premiership were to order him a thousand pounds from the exchequer and despatch him the most flattering invitations The same post brought a letter from Oxford, soliciting Swift's company in his retirement, and, to the latter's immortal honour, he hesitated not an instant in preferring the solace of his friend to the offers of St John When, a few days afterwards, Oxford was in prison and in danger of his life, Swift begged to share his captivity, and it was only on the offer being declined that he finally directed his steps towards Ireland, where he was very ill received The draft on the exchequer was intercepted by the queen's death

Literary friendships and miscellaneous writings

These four busy years of Swift's London life had not been entirely engrossed by politics. First as the associate of Steele, with whom he quarrelled, and of Addison, whose esteem for him survived all differences, afterwards as the intimate comrade of Pope and Arbuthnot, the friend of Congreve and Atterbury, Parnell and Gay, he entered deeply into the literary life of the period He was treasurer and a leading member of the Brothers, a society of wits and statesmen which recalls the days of Horace and Mæcenas He promoted the subscription for Pope's *Homer*, contributed some numbers to the *Tatler*, *Spectator*, and *Intelligencer*, and joined with Pope and Arbuthnot in

establishing the Scriblerus Club, writing *Martinus Scriblerus*, his share in which can have been but small, as well as *John Bull*, where the chapter recommending the education of all blue-eyed children in depravity for the public good must surely be his. His fugitive productions during this period are very numerous, and mostly distinguished not only by pungent wit but by overflowing animal spirits. The most celebrated are the cruel but irresistibly ludicrous satires on the astrologer Partridge, a man in fact respectable for his sincere belief in his art, and no mean writer. Many of his best poems belong to this period. A more laboured work, his *Memorial* to Harley, proposing the regulation of the English language by an academy, is chiefly remarkable as a proof of the deference paid to French taste by the most original English writer of his day. His *History of the Last Four Years of Queen Anne* is not on a level with his other political writings. To sum up the incidents of this eventful period of his life, it was during it that he lost his mother, always loved and dutifully honoured, by death; his sister had been estranged from him some years before by an imprudent marriage, which, though making her a liberal allowance, he never forgave.

ella and nessa. The change from London to Dublin can seldom be an agreeable one. To Swift it meant for the time the fall from unique authority to absolute insignificance. All share in the administration of even Irish affairs was denied him; every politician shunned him; and his society hardly included a single author or wit. At a later period he talked of "dying of rage, like a poisoned rat in a hole"; for some time, however, he was buoyed up by feeble hopes of a restoration to England. So late as 1726 he was in England making overtures to Walpole, but he had no claim on ministerial goodwill, and as an opponent he had by that time done his worst. By an especial cruelty of fate, what should have been the comfort became the bane of his existence. We have already mentioned his invitation of Esther Johnson and Mrs Dingley to Ireland. Both before and after his elevation to the deanery of St Patrick's these ladies continued to reside near him, and superintended his household during his absence in London. He had frustrated a match proposed for Stella, and, with his evident delight in the society of the dark-haired, bright-eyed, witty beauty, a model, if we may take his word, of all that woman should be, it seemed unaccountable that he did not secure it to himself by the expedient of matrimony. A constitutional infirmity has been suggested as the reason, and the conjecture derives support from several peculiarities in his writings. But, whatever the cause, his conduct proved none the less the fatal embitterment of his life and Stella's and yet another's. He had always been unlucky in his relations with the fair sex. In 1694 he had idealized as "Varina" a Miss Waring, who then discouraged his attentions, but two years later made him advances in her turn. Swift's mind had also changed, and he could find no better way out of the difficulty than an insulting letter affecting to accept her proposal on terms which he knew must put it out of the question. Varina was avenged by Vanessa, who pursued Swift to far other purpose. Esther Vanhomrigh, the orphan daughter of a commissioner of Irish trade, had become known to Swift at the height of his political influence. He lodged close to her mother, and was a frequent guest at her table. Vanessa insensibly became his pupil, and he insensibly became the object of her impassioned affection. Her letters reveal a spirit full of ardour and enthusiasm, and warped by that perverse bent which leads so many women to prefer a tyrant to a companion. Swift, on the other hand, was devoid of passion. Of friendship, even of tender regard, he was fully capable, but not of love. The spiritual realm, whether in divine or earthly things, was a region closed to him, where he never set foot. As a friend he must have greatly preferred Stella to Vanessa; and from this point of view his loyalty to the original object of his choice, we may be sure, never faltered. But Vanessa assailed him on a very weak side. The strongest of all his instincts was the thirst for imperious domination. Vanessa hugged the fetters to which Stella merely submitted. Flattered to excess by her surrender, yet conscious of his binding obligations and his real preference, he could neither discard the one beauty nor desert the other. It is humiliating to human strength and consoling to human weakness to find the Titan behaving like the least resolute of mortals, seeking refuge in temporizing, in evasion, in fortuitous circumstance. He no doubt trusted that his removal to Dublin would bring relief, but here again his evil star interposed. Vanessa's mother died (1714), and she followed him. Unable to marry Stella without destroying Vanessa, or to openly welcome Vanessa without destroying Stella, he was thus involved in the most miserable embarrassment; still, for a time he continued to temporize. At length, unable to bear any more Stella's mute reproach and his own consciousness of wrong, he gave a reluctant consent to a private marriage, which, as at least the weight of testimony seems to prove, though there is no documentary evidence, was accordingly performed. This was in 1716. At the same time he insisted on their union being kept a strict secret, justifying a demand really dictated by tenderness for Vanessa, and perhaps by the unavowable reason to which allusion has been made, on the most futile and frivolous pretexts. Never more than a nominal wife, the unfortunate Stella commonly passed for his mistress till the day of her death, bearing her doom with uncomplaining resignation, and consoled in some degree by unquestionable proofs of the permanence of his love, if his feeling for her deserves the name. Meanwhile his efforts were directed to soothe Miss Vanhomrigh, to whom he addressed *Cadenus [Decanus] and Vanessa*, the history of their attachment and the best example of his serious poetry, and for whom he sought to provide honourably in marriage, without either succeeding in his immediate aim or in thereby opening her eyes to the hopelessness of her passion. In 1717, probably at his instance, she retired from Dublin to Marley Abbey, her seat at Celbridge. For three years she and Swift remained apart, but in 1720, on what occasion is uncertain, he began to pay her regular visits. Sir Walter Scott found the Abbey garden still full of laurels, several of which she was accustomed to plant whenever she expected Swift, and the table at which they had been used to sit was still shown. But the catastrophe of her tragedy was at hand. Worn out with his evasions, she at last (1723) took the desperate step of writing to Stella, or according to another account to Swift himself, demanding to know the nature of the connexion with him, and thus terminated the melancholy history as with a clap of thunder. Stella replied by the avowal of her marriage, sent her rival's letter to Swift, and retired to a friend's house. Swift rode down to Marley Abbey with a terrible countenance, petrified Vanessa by his frown, and departed without a word, flinging down a packet which only contained her own letter to Stella. Vanessa died within a few weeks. She left the poem and correspondence for publication. The former appeared immediately, the latter was suppressed until it was published by Sir Walter Scott.

Five years afterwards Stella followed Vanessa to the grave. The grief which the gradual decay of her health evidently occasioned Swift is sufficient proof of the sincerity of his attachment, as he understood it. It is a just remark of Thackeray's that he everywhere half-consciously recognizes her as his better angel, and dwells on her wit

and her tenderness with a fondness he never exhibits for any other topic. Yet he could never overcome his repugnance to acknowledge their union till she lay on her deathbed, when he was heard by Mrs Whiteway (his cousin, a lady of fortune and talent, who, though not residing with him, superintended his household during his latter years) to say, "Well my dear, if you wish it, it shall be owned." She answered, "It is too late." On January 28, 1728, she died, and her wretched lover sat down the same night to record her virtues in language of unsurpassed simplicity, but to us who know the story more significant for what it conceals than for what it tells. A lock of her hair is preserved, with the inscription in Swift's handwriting, most affecting in its apparent cynicism, "Only a woman's hair!" "Only a woman's hair," comments Thackeray, "only love, only fidelity, purity, innocence, beauty, only the tenderest heart in the world stricken and wounded, and passed away out of reach of pangs of hope deferred, love insulted, and pitiless desertion, only that lock of hair left, and memory, and remorse, for the guilty, lonely wretch, shuddering over the grave of his victim." The more unanswerable this tremendous indictment appears upon the evidence the greater the probability that the evidence is incomplete. *Tout comprendre c'est tout pardonner.* The hypothesis to which we have referred must for ever remain an hypothesis, but better than any other it not only excuses but explains.

The Drapier's letters. Between the death of Vanessa and the death of Stella, as though withheld by an evil fate until he could no longer enjoy them, came the greatest political and the greatest literary triumph of Swift's life. He had fled to Ireland a broken man, to all appearance politically extinct; a few years were to raise him once more to the summit of popularity, though power was for ever denied him. With his fierce hatred of what he recognized as injustice, it was impossible that he should not feel exasperated at the gross misgovernment of Ireland for the supposed benefit of England, the systematic exclusion of Irishmen from places of honour and profit, the spoliation of the country by absentee landlords, the deliberate discouragement of Irish trade and manufactures. An Irish patriot in the strict sense of the term he was not; he looked upon the indigenous population as conquered savages; but his pride and sense of equity alike revolted against the stay-at-home Englishmen's contemptuous treatment of their own garrison, and he delighted in finding a point in which the triumphant faction was still vulnerable. His *Proposal for the Universal Use of Irish Manufactures*, published anonymously in 1720, urging the Irish to disuse English goods, became the subject of a prosecution, which at length had to be dropped. A greater opportunity was at hand. One of the chief wants of Ireland in that day, and for many a day afterwards, was that of small currency adapted to the daily transactions of life. Questions of coinage occupy a large part of the correspondence of the primate, Archbishop Boulter, whose anxiety to deal rightly with the matter is evidently very real and conscientious. There is no reason to think that the English ministry wished otherwise; but secret influences were at work, and a patent for supplying Ireland with a coinage of copper halfpence was accorded to William Wood on such terms that the profit accruing from the difference between the intrinsic and the nominal value of the coins, about 40 per cent., was mainly divided between him and the duchess of Kendal, the king's mistress, by whose influence he had obtained the privilege. Swift now had his opportunity, and the famous letters signed M. B. Drapier (1724) soon set Ireland in a flame. Every effort was used to discover, or rather to obtain legal evidence against, the author, whom, Walpole was assured, it would then have taken ten thousand men to apprehend. None could be procured; the public passion swept everything before it; the patent was cancelled; Wood was compensated by a pension; Swift was raised to a height of popularity which he retained for the rest of his life; and the only real sufferers were the Irish people, who lost a convenience so badly needed that they might well have afforded to connive at Wood's illicit profits. Perhaps, however, it was worth while to teach the English ministry that not everything could be done in Ireland. Swift's pamphlets, written in a style more level with the popular intelligence than even his own ordinary manner, are models alike to the controversialist who aids a good cause and to him who is burdened with a bad one. The former may profit by the study of his marvellous lucidity and vehemence, the latter by his sublime audacity in exaggeration and the sophistry with which he involves the innocent halfpence in the obloquy of the nefarious patentee.

Gulliver's Travels. The noise of the Drapier's letters had hardly died away when Swift acquired a more durable glory by the publication of *Gulliver's Travels* in 1726. The work had been at least partly written by 1722, and the keenness of the satire on courts and statesmen suggests that it was planned while Swift's disappointments as a public man were still rankling and recent. It is Swift's peculiar good fortune that his book can dispense with the interpretation of which it is nevertheless susceptible, and may be equally enjoyed whether its inner meaning is apprehended or not. It is so true, so entirely based upon the facts of human nature, that the question what particular class of persons supplied the author with his examples of folly or misdoing, however interesting to the commentator, may be neglected by the reader. It is also fortunate for him that in three parts out of the four he should have entirely missed "the chief end I propose to myself, to vex the world rather than divert it." The world, which perhaps ought to have been vexed, chose rather to be diverted; and the great satirist literally strains his powers *ut pueris placeat*. Few books have added so much to the innocent mirth of mankind as the first two parts of Gulliver; the misanthropy is quite overpowered by the fun. The third part, equally masterly in composition, is less felicitous in invention; and in the fourth Swift has indeed carried out his design of vexing the world at his own cost. Human nature indignantly rejects her portrait in the Yahoo as a gross libel, and the protest is fully warranted. An intelligence from a superior sphere, bound on a voyage to the earth, might actually have obtained a fair idea of average humanity by a preliminary call at Lilliput or Brobdingnag, but not from a visit to the Yahoos. While *Gulliver* is infinitely the most famous and popular of Swift's works, it exhibits no greater powers of mind than many others. The secret of success, here as elsewhere, is the writer's marvellous imperturbability in paradox, his teeming imagination, and his rigid logic. Grant his premises, and all the rest follows; his world may be turned topsy-turvy, but the relative situation of its contents is unchanged. The pains he took to be correct are evinced by the care with which, as Prof. De Morgan has shown, he calculated the proportions of Lilliput and Brobdingnag to ordinary humanity on the basis of 1 to 12 and 12 to 1 respectively, and his copying the description of the storm word for word from Sturmy's *Compleat Mariner*. By such accuracy and consistency he has given the wildest fiction imaginable an air of veracity rivalling Defoe.

Swift's latter years. Swift's grave humour and power of enforcing momentous truth by ludicrous exaggeration were next displayed in his *Modest Proposal for Preventing the Children of Poor People in Ireland from Being a Burden to their Parents*, by fattening and eating them (1729), a parallel to the *Argument*

against Abolishing Christianity, and as great a masterpiece of tragic as the latter is of comic irony The *Directions to Servants* in like manner derive their overpowering comic force from the imperturbable solemnity with which all the misdemeanours that domestics can commit are enjoined upon them as duties The power of minute observation displayed is most remarkable, as also in *Polite Conversation* (written in 1731, published in 1738), a surprising assemblage of the vulgarities and trivialities current in ordinary talk As in the *Directions*, the satire, though cutting, is good-natured, and the piece shows more animal spirits than usual in Swift's latter years It was a last flash of gaiety The attacks of giddiness and deafness to which he had always been liable increased upon him, and his literary compositions became confined to occasional verses, not seldom indecent and commonly trivial, with the exception of his remarkable lines on his own death and the delightful *Hamilton's Bawn*, and to sallies against the Irish bishops, in whose honest endeavours to raise the general standard of their clergy he could only see arbitrary interference with individuals He fiercely opposed Archbishop Boulter's plans for the reform of the Irish currency, but admitted that his real objection was sentimental the coins should be struck as well as circulated in Ireland His exertions in repressing robbery and mendicancy were strenuous and successful His popularity remained as great as ever, and, when he was menaced by the bully Bettesworth, Dublin rose as one man to defend him He governed his cathedral with great strictness and conscientiousness, and for years after Stella's death continued to hold a miniature court at the deanery But his failings of mind were exacerbated by his bodily infirmities, he grew more and more whimsical and capricious, morbidly suspicious and morbidly parsimonious, old friends were estranged or removed by death, and new friends did not come forward in their place For many years, nevertheless, he maintained a correspondence with Pope and Bolingbroke, and with Arbuthnot and Gay until their deaths, with such warmth as to prove that an ill opinion of mankind had not made him a misanthrope, and that human affection and sympathy were still very necessary to him The letters become scarcer and scarcer with the decay of his faculties, at last, in 1740, comes one to his best Dublin friend, Mrs Whiteway, of heart-rending pathos —

"I have been very miserable all night, and to day extremely deaf and full of pain I am so stupid and confounded that I cannot express the mortification I am under both of body and mind All I can say is that I am not in torture, but I daily and hourly expect it Pray let me know how your health is and your family I hardly understand one word I write I am sure my days will be very few, few and miserable they must be I am, for those few days, yours entirely,—Jonathan Swift

"If I do not blunder, it is Saturday, July 26, 1740

"If I live till Monday I shall hope to see you, perhaps for the last time"

Insanity and death. In March 1742 it was necessary to appoint guardians of Swift's person and estate In September of the same year his physical malady reached a crisis, from which he emerged a helpless wreck, with faculties paralysed rather than destroyed "He never talked nonsense or said a foolish thing" The particulars of his case have been investigated by Dr Bucknill and Sir William Wilde, who have proved that he suffered from nothing that could be called mental derangement until the "labyrinthine vertigo" from which he had suffered all his life, and which he erroneously attributed to a surfeit of fruit, produced paralysis, "a symptom of which was the not uncommon one of aphasia, or the automatic utterance of words ungoverned by intention As a consequence of that paralysis, but not before, the brain, already weakened by senile decay, at length gave way, and Swift sank into the dementia which preceded his death" (Craik, *Life of Swift*) The scene closed on October 19, 1745 With what he himself described as a satiric touch, his fortune was bequeathed to found a hospital for idiots and lunatics He was interred in his cathedral, in the same coffin as Stella, with the epitaph, written by himself, "Hic depositum est corpus Jonathan Swift, S T P, hujus ecclesiæ cathedralis decani, ubi sæva indignatio ulterius cor lacerare nequit Abi viator, et imitare, si poteris, strenuum pro virili libertatis vindicem"

Personal and literary character. The stress which Swift thus laid upon his character as an assertor of liberty has hardly been ratified by posterity, which has comparatively neglected the patriot for the genius and the wit Not unreasonably, for if half his patriotism sprang from an instinctive hatred of oppression, the other half was disappointed egotism He utterly lacked the ideal aspiration which the patriot should possess his hatred of villainy was far more intense than his love of virtue The same cramping realism clings to him everywhere beyond the domain of politics,—in his religion, in his fancies, in his affections At the same time, it is the secret of his wonderful concentration of power he realizes everything with such intensity that he cannot fail to be impressive Except in his unsuccessful essay in history, he never, after the mistake of his first Pindaric attempts, strays beyond his sphere, never attempts what he is not qualified to do, and never fails to do it. His writings have not one literary fault except their occasional looseness of grammar and their frequent indecency Within certain limits, his imagination and invention are as active as those of the most creative poets As a master of humour, irony, and invective he has no superior, his reasoning powers are no less remarkable within their range, but he never gets beyond the range of an advocate Few men of so much mental force have had so little genius for speculation, and he is constantly dominated by fierce instincts which he mistakes for reasons As a man the leading note of his character is the same,—strength without elevation His master passion is imperious pride,—the lust of despotic dominion He would have his superiority acknowledged, and cared little for the rest Place and profit were comparatively indifferent to him, he declares that he never received a farthing for any of his works except *Gulliver's Travels*, and that only by Pope's management, and he had so little regard for literary fame that he put his name to only one of his writings Contemptuous of the opinion of his fellows, he hid his virtues, paraded his faults, affected some failings from which he was really exempt, and, since his munificent charity could not be concealed from the recipients, laboured to spoil it by gratuitous surliness Judged by some passages of his life he would appear a heartless egotist, and yet he was capable of the sincerest friendship and could never dispense with human sympathy Thus an object of pity as well as awe, he is the most tragic figure in our literature,—the only man of his age who could be conceived as affording a groundwork for one of the creations of Shakespeare "To think of him" says Thackeray, "is like thinking of the ruin of a great empire" Nothing finer or truer could be said

Swift's correspondence is the best authority for his life. Of his contemporaries, we are mainly indebted to his panegyrist Delany and his detractor Lord Orrery Hawkesworth compiled the particulars of his life, and published what was the standard edition of his works till the appearance of Sir Walter Scott's in 1814 This edition is not likely to be superseded, but might with great advantage be reissued with amendments and additions. The biography prefixed is based on Hawkesworth, but is far more copiously and elegantly written At the same time the author's views are frequently conventional, his judgments superficial, and his good nature has made him too indulgent to his hero The late John Forster subjected all available records of Swift's life to the most diligent scrutiny, and in 1875 published the first volume, coming down to 1711, of a biography intended to have been completed

in three volumes. Invaluable in many respects, it exhibited the process as well as the result of biography, and hence threatened to be too long. Mr H. Craik, succeeding to the post vacated by Forster's death, judiciously reduced the scale, and produced in one volume (1882) a work which will long rank as the standard one on the subject. Remarkable monographs on Swift have been produced by Leslie Stephen in the "Men of Letters" series, Dr Johnson in the *Lives of the Poets*, Thackeray in the *English Humourists*. Mr Stephen is anxiously impartial; Johnson's acuteness is perverted by his antipathy; Thackeray, as is natural in a novelist, has dwelt disproportionately on the romantic side of Swift's history, and his pity for Stella and Vanessa forms too large an element in his general judgment. But he has, better than any one else, apprehended the fearfully tragic element in Swift's character and fortunes. Swift's early life has been carefully investigated by Dr Barrett of Trinity College, and the final epoch of his life by Monck Mason and Sir William Wilde. His greatness is exaggerated and his failings are extenuated in two brilliant articles in the *Quarterly Review*, vols. cli. and clvi. Minor points in his life and writings have received much elucidation from numerous inquirers, especially the late Mr Charles Dilke and Colonel F. Grant. Mr Stanley Lane Poole has edited selections from his works and correspondence, with excellent notes and prefaces, and has prepared a valuable bibliography. (R. G.)

SWIMMING AND DIVING. In the case of man the power of swimming is acquired, not natural. As compared with the lower animals, to most of which it comes perfectly easily, he is at a disadvantage in its acquisition, owing not to his greater relative weight so much as to the position of his centre of gravity, along with the fact that in the case of quadrupeds the motions which serve to support and propel them in the water are very similar to those of locomotion on land. No race of mankind, however, can be mentioned to which the art is unknown, and in many barbarous countries it is more widely diffused and carried to greater perfection than amongst the civilized nations of the world.

For learning to swim, a quiet sandy beach is the best place, as sea water is more buoyant than fresh. All artificial aids, such as corks, air belts, cork jackets, inflated bladders, and the like, may be avoided; they raise some parts of the body too high above and so sink others too far below the natural plane of flotation, whereas the first fundamental rule is that the mouth only should be above water, and the legs close to the surface. Belts, &c., are also apt to become misplaced and so cause trouble and annoyance as well as danger. It is best for beginners to take some instruction from a practical teacher, though many have become adepts by merely watching good performers. Confidence in the floating power of the body is the first thing to be acquired. The easiest way of floating is to lie on the back (which should be slightly hollowed), the arms being stretched out beyond the head but not lifted out of the water; this attitude not only facilitates respiration but counterbalances the weight of the lower limbs. The knees may be bent outward, the toes also pointing sideways, the hips rigid, so assisting to keep the legs up as close as possible to the top of the water. By easy breathing one will soon be convinced that, properly balanced and with lungs kept charged, the body will assert its buoyancy.

To further enable him to realize that water is capable of supporting the human body, the learner may adopt the following plan. Walk down the steps of a bath, or along a shelving beach on a calm day, into about 3 feet of water; turn and face the shallow place, and, having taken a breath, stoop down and try to pick an egg or some similar object (a handful of sand will suffice) from the bottom. Repeat this several times leisurely, going farther out at each venture, till the water reaches up to but not higher than the middle of the chest. It will soon be found that the object is not so easy of recovery, and the beginner learns that but little exertion is required to keep the body afloat. When this experience has been gained the novice should commence with the *Breast Stroke*, which is nowadays sometimes unjustly set aside as the "old stroke." It is neat, natural, and graceful enough, though necessarily the slowest, from the great resistance of the chest to the water and the fact that part of the arm stroke is negatived by its own movement. Like walking in pedestrianism, however, it forms the groundwork of every other branch of the art, and cannot safely be overlooked. The stroke is commenced by placing the hands with the backs upward, and the wrists bent so that the fingers will point to the front, the insides of the wrist-joints between arm and thumbs touching the breast not lower than 4 inches under water. Begin the stroke by pushing the arms gently forward to their full extent, keeping the palms flat and the fingers closed. Now turn the palms of both hands outward, and make a strong stroke to the right and left by each arm through an angle of 90°, in this part of the stroke the two arms describe a semicircle, of which the head may be termed the centre. It must be most distinctly borne in mind that all depression of the hands will tend to raise the body perpendicularly, whereas the only true position in swimming is the horizontal, which propels it forward. To complete the arm movement, bend the elbows backward and inward, until they come close to (but not necessarily touching) the sides of the body. Carry the hands in a straight line edgeways to the position from which they started in front of the chest. Simultaneously with the stretching of the hands from the front of the body the feet are struck out to the utmost width in a way cleft for them by the toes. As the arms are being brought round in the semicircular motion the lower limbs are stiffened and brought firmly together by grasping the water, so to speak, with the whole of the leg, more especially between the knees, ankles, and soles and toes of the feet. Whilst thus imparting forward motion to the swimmer, they finish in a straight line behind the body. Then, when the arms are bent, and the hands are being brought to the front of the body, the knees are turned outward, heels kept together, toes also turned out, and the feet are carried up to the body and in this position are once more ready for repeating the movements as described. Beginners must be careful not to make the arm movements quicker than those of the legs, and it must be distinctly remembered that the latter are the great propellers. Unison of the movements as mentioned, and regularity in each part of the stroke, are indispensable to perfection. All hurry and excitement must be carefully avoided, and every complete stroke and kick gone about with mechanical precision and neatness. The only part requiring strong muscular exertion being the closing of the legs after they have been spread wide apart,—the one strong propelling element,—every effort is to be made to ensure correctness and power in its performance. The arm movements should be easy and graceful, all jerkiness or suddenness of motion being carefully avoided.

Breathing should be unrestrained and natural, without gasping, sputtering, or short or sudden heavings. A safe rule is to have a full breath at every stroke, its division being regulated as follows. Blow slowly outward when the first part of the arm movement is being performed, *i.e.*, stretched out in front; inspire as the hands are going outward and round. Then, as the lungs are fully charged, no effort is necessary to suspend respiration while the hands are carried in to the front of the body again. This regularity of breathing is essential to pleasure, comfort, and gracefulness of action. The nostrils and air-passages should always be thoroughly cleared, the mouth cleansed, and the throat gargled before entering the water.

Swimming on the Back is a pleasant and useful branch of the art; the chief requisite for its acquirement is confidence. The tyro should begin practice in water reaching

up to about the upper part of the chest, turn his back shoreward, take a long breath, and lie gently backward in the water, keeping the hands on the waist with the elbows extended outward, the chest being expanded, and the breath held As one lies well back the feet will be lifted off the ground, they should then be spread outward as far apart as possible, in the same position as when they are opened up in breast swimming The body and legs are thus lying extended at full length like the letter Y, the legs forming the branches or fork Now comes the propelling part of the movement As in the front stroke, the muscles are set, and the legs are by one strong motion brought firmly and closely together While this is being done the toes, by a slight movement of the ankle, are turned upward, and so, as the movement is finished, the great toes, inner ankles, and inside of the whole leg meet This motion, strongly but not jerkily executed, sends the body forward, and, when the impetus obtained is nearly—not quite—expended, the legs are bent, so that the feet are drawn close up to the trunk, with the knees outward and heels together The stroke is renewed by spreading apart, closing again, and so on The breath is exhaled when spreading and closing the legs, and inhaled as the feet are drawn up to the body If greater speed is wanted, the hands can be used as sculls by carrying them outward from the body, but at the same time level with it, palms facing downward When the arms are sufficiently extended to be in a line across from hand to hand, the wrists are turned to allow of the palms of the hands facing toward the feet, thumbs upward Elbows, wrists, and hands are now firmly braced, and a strong pull towards the legs is made This is the progressive motion, and should be performed just as the legs are being closed

Another style is to bend the elbows downward, so as to allow of the hands being carried upward along the sides of the body, thumbs inward, and palms facing the bottom of the water When the hands have been carried up to the armpits they are spread apart to the full extent of the arms, and the propelling part is performed as in the other method by pulling strongly toward the legs

A still more powerful stroke, and one used at competitions, is accomplished by carrying the hands up to the armpits, as described in last method, then, turning the wrist so as to allow of the palms of the hands facing upward, point the fingers in the direction of progress, stretch both arms as far as possible in a line with the body and beyond the head, and turn the wrists half round, until the hands are back to back, thumbs upward The propelling action is now performed by sweeping both hands outward and round until they touch the legs and the arms are once more straight along the sides of the body There is a double kick in this style, and the action is as follows When the hands are being carried up to the shoulder one kick is delivered; then as the arms are being carried beyond the head the nether limbs are drawn up in position for another kick, which is delivered as the arms are sweeping down on the stroke This is no mere ornamental stroke, but combines in its practice grace with power, and enables the swimmer to move through the water at great speed

Another racing back stroke is performed by lifting hands and arms out of the water at the finish of the pull downward, carrying them in the air, stretching them at full length forward beyond the head, and then dipping them into the water, executing the positive part of the stroke as in the last-described method. In this stroke there is only a single kick to each pull of the arms, the legs being drawn up as the arms are swung up in the air and closed as the arms are pulled through the water. While this movement is much practised by some experts, it is neither so graceful nor so speedy as the other, and there is much splashing, while steering is, in the case of a close race, likely to become rather erratic Both are at the present time the fastest known methods of swimming on the back, and, with moderately good turning and pushing in a swimming bath, 100 yards should be covered in about 74 seconds, probably less

Of *treading* as a branch of swimming something should be known by every one It is the only department of the art that is at all natural, and, if treading were resorted to in cases of accidental immersion, three-fourths of the resulting deaths would be prevented The essential condition, of course, is that the hands be kept under water When one falls into water the legs sink and the body assumes a perpendicular position, the water splashes over the face, and, once the eyes become filled or the mouth covered, the inclination of any one unable to swim is to throw the hands up and make an effort as if to creep along on the surface These efforts only increase the danger of the position On becoming submerged one should keep perfectly inactive for a brief time, the head will soon rise above the surface, and at this moment one ought to beat downward with both hands alternately, never allowing them to splash or disturb the surface, the head being leaned back so as to keep only the face and nostrils clear The back of the head and ears may be covered, but this does not matter The motions of the hands, exactly similar to those of a dog's forepaws when swimming and walking, are to be continued, the feet at the same time striking down—not hurriedly, nor with sudden jerky movement, but easily and gracefully, the ankles moving as if working treadles, so that the soles of the feet act as sustaining and, it may be, propelling surfaces The movements of hands and feet may be altered by beating downward with both hands at once, or both feet at once, but in cases of accident the former action is to be recommended Swimmers, when treading at competitions or for display, either fold their arms across their chest or hold hands and arms above the surface In artistic swimming trials, as much as possible of the body should be shown above the surface, and bobbing up and down ought to be avoided Treading is of much importance even to a good swimmer, as it allows him to divest himself of upper clothing, and enables him to lay hold of anything, such as a rope or line that does not quite reach the surface, it is also the most comfortable position in which one can partake of refreshment in case of a long swim, and is useful for purposes of conversation

The *Side Stroke* may be said to hold in swimming a position somewhat similar to that of running in pedestrianism, as it becomes better known, the advantages of this style of aquatic progression are becoming more and more appreciated The practice of it, however, ought not to be begun until complete proficiency has been attained in the primary stroke Its main recommendations are apparent almost at a glance A good average side movement will carry the swimmer a stroke in two seconds, each stroke covering a distance of fully six feet The method is said by some to have been introduced by George Pewters about the year 1850 The body is turned on either side, but preferably with the right side downward, as thereby the legs act more freely and naturally and the heart has no weight on it to impede its action The head is more immersed and thereby reduced in weight, being supported by the water and not by any muscular exertion of the neck or shoulder, and the lower extremities are less immersed than in the breast stroke If one is lying on the right side, the right arm is thrown boldly out in front, with the palm of the hand downward and on a level with the lower side of the head When pushed out to the utmost it is kept rigid, brought downward through the water in one strong movement, without any bending of either wrist or elbow,

and this, the positive action, is finished when the hand has reached the legs, and comes between these limbs at full stretch. It is then carried up along the body to the chin, and the stroke renewed. The left hand is formed into a scoop, turned outward by the wrist at right angles to the fore-arm. The left arm, with the elbow bent, is then directed outward, and makes a straight pulling (not circular nor swinging) stroke to the left hip. When one arm is performing the negative the other is at the positive part of the stroke. The action of the legs should be long and vigorous, and they should never cross each other, but should work in unison with the arms and shoulders. The left knee is brought up in front of the body, with the foot in front of and at right angles to the body. Put the foot in a line with the front of the leg, and bring it round to meet the other in a line with the body. Meanwhile stretch the right or lower leg as far away as possible from the body toward the back and then bring it down to meet the other by a powerful plain stroke. The legs are then returned upward to the body, the heels touching, the knees apart, the toes of the left foot forward and of the right foot downward. To learn this graceful and useful side stroke some persons need long and steady practice, others acquire it comparatively quickly. The swimmer steers with his left or right hand and arm as the direction demands. The head and neck must be held in one position, not raised nor turned at any part of the stroke. Bearings should be taken from what can be seen in the line of vision away from and in front of the body, and only very seldom indeed, should the head be turned to look in advance. Breath is inhaled as the under hand is pulling downward, and exhalation should take place while the mouth is immersed, which is when the uppermost hand is performing the stroke along the body.

The coincident movement of arms and legs may be thus described. As the legs are bent up to the body the upper or left hand has been stretched in front and the right or lower arm has just finished the pull. As the top arm pulls downward the legs are opened wide and almost in the same motion swung round and closed. It will be apparent that the legs are returned upward with knees bent as the downward pull is being performed with the lower arm. No effort is to be made to sink the head, neither is it to be held up in any way. The turn of the body by the power of the strokes will be quite enough to allow of the lips being sufficiently clear of the water for the purpose of inspiration. There should be no sudden pull at any part whatever of this complete stroke.

The *Overhand Stroke*, when properly practised and acquired, is the most useful and easy of all styles of swimming. Beginners, however, should beware of acquiring it before they are thorough adepts with the side stroke, otherwise they lose all power of speed and good appearance. Harry Gurr is sometimes said to have been the inventor of this stroke in 1863, but Harry Gardener, in August of the year previous, when he won the 500 yards championship in Manchester, used the overhand or overarm stroke. The only movements of the side stroke which differ from those of the overhand are those of the left or upper arm and hand. By carrying this arm in the air a lengthened reach is obtained above the surface. As in the side stroke, the head lies as far as possible into the water, the body, legs, and feet in a straight line level with and close to the surface. The left arm is carried forward and stretched as far as possible out of the water in a line with the face and in advance of the head. The arm and hand re-enter the water, and are pulled through it with the strongest propelling stroke. The limb out of water should be carried through the air quietly, gracefully, and evenly till dipped for the stroke, not swung uselessly round from the shoulder in a half circle. The left arm and hand being in the air, the head lies deeper in the water than in the side stroke, and it is reduced in weight. The legs work simultaneously with the left arm, that is, they are drawn up as this arm reaches in front, and are at their nearest wide stretch by the time it is in position for the pull, they are then pulled strongly together as the upper arm is performing its strong movement. At no time when the upper arm is being carried forward above the water should the hand be higher than a very few (say about three) inches above the surface. The elbow alone is elevated, and is the highest part of the arm. In fact, the hand is so close to the surface that, on being lifted upward after the delivery of the stroke, the wrist has to be bent, otherwise the fingers would actually touch the water. Once, however, the hand comes opposite the eyes it is straightened in a line with the fore-arm and in this position carried to the dipping point. Breathing is regulated in precisely the same way as when swimming by means of the side stroke.

Touching and Turning.—The methods of "touch and turn" were brought into vogue by the now numerous swimming races in baths. Whether the baths be long or short, from 10 to 15 feet in the push off is gained at each end of every length by all competitors. Assuming that the swimmer is using the side or overhand stroke and going on the right side, the method to be adopted is as follows. When within 3 feet of the end wall of the bath the left or upper hand quits its propelling movement, and reaches in front of the head till it touches the wall just above water-mark. The palm of the hand is then placed horizontally on the wall, the fingers to the right, which is the direction to which one is turning, the little finger is uppermost and thumb undermost. The knees are bent, and the body, now close to the wall, is turned to the right on its own axis by the left hand, after which the feet press against the wall under the hand. As in diving and plunging, the body, arms, and hands are in a straight line, and the head between the biceps, all under water. The thighs are doubled up under the loins, the calves of the legs touching the back of the thighs, and the soles of the feet pressing hard against the wall. A strong push-off is made by the feet and legs, and the swimmer resumes his ordinary stroke and course for a new length.

Ocean Swimming.—Persons having from any cause to swim in the heavy rolling breakers of mid ocean should use the side stroke when available. No attempt should be made to breast or mount the waves. By taking their direction a side stroke swimmer is carried an unexpectedly long distance. The large dangerous rollers come almost in regular succession after an interval of small waves. The swimmer soon notices them, fills his lungs, swims into them, ducking the head, and quickly emerges when the wave has passed. Then a fresh supply of breath is inhaled.

Plunging.—In this the performer enters the water in somewhat the same manner as when diving (see below), but at a flat angle, and from the moment of doing so makes no active muscular movement whatever of any part of the body under water. Plunging came into vogue as the most graceful and practical method of starting in swimming races. From 3 to 5 feet above the water-level makes the best springing point, whether from bank, board, or rock. The knees should be kept together and slightly bent, with the weight on the balls of the feet and the lungs fully charged. The spring forward at the signal to start is given with all muscular power available. A swing of the arms from behind is taken, and, as the feet quit their support, the arms are swung forward so as to rise up to and straight beyond the head. The body is shot into mid-air as far as possible, and, before touching the water, the head falls between the arms till the chin just touches the chest and the ear grazes the inside of the biceps. The body now glides gracefully and almost noiselessly into the water, with the chest slightly hollowed, the shoulders contracted, and the arms rigidly braced out straight. The hands are now laid flat and the thumbs locked, while the hips and ankles are kept in one rigid straight line, with the soles of the feet turned upward and level with the surface, the toes pointing straight behind. The forward motion from the spring continues as long as the body will float and the air in the lungs can be held, when the feet, followed by the arms, begin to sink, and the plunger ends his performance by merely raising his head. Adepts in this branch have saved themselves from a sinking vessel by a long plunge from the ship's side, and so by one effort have got clear out of the vortex that is caused by her settling down and sinking.

Diving.—The rule in diving, as distinguished from plunging, is most explicit. In diving alone are the limbs allowed to make muscular movements under water. When properly performed it is a most graceful feat to the eye, and a good swimmer is, as a rule,

known by the way in which he enters the water. The height of the end of the board from the surface of the water may be from 3 to 20 feet. If the water is taken properly a clean dive or header is made, but some swimmers are careless and will flop into the water with the body contracted like a ball, instead of straightened out like an arrow. The descent of good divers into the water varies from 3 to 4 feet, of clumsy performers from 7 to 8 feet. The dive may be a standing or running one. The feet and legs are kept together, with the chest inflated, the arms slightly swung to and fro twice or so, and the body and legs bent towards the water. The lungs are charged, and the dive is made immediately before the arms and hands are raised forward into the air above the bent head. The feet are used with all the power possible in springing off. When in mid air the diver straightens himself out from finger tips to toes. The shoot downwards is made by declining the arms so as to enclose the head, the chest is momentarily contracted, and the water is gracefully and noiselessly entered fingers first. The instant the body is covered, throw up the head and arms so as to reach the surface. The eyes instinctively close as they enter the water; if it were otherwise, the force with which the surface is struck might cause injury, especially in the case of high diving. As soon as the water is entered the eyes should be opened, as swimming under water with them closed may be attended with danger. The best method for novices is to begin from a board 3 feet high; and, as confidence and a good style are acquired, the height may be raised 1 or $1\frac{1}{2}$ feet at a time. Running headers are accomplished by running 10 or 12 paces before springing off, and the diver endeavours to clear as long a distance as possible before entering the water. Muscles and weight have nothing whatever to do with perfection in diving. Slim youths and heavy middle-aged men and women have alike excelled in this branch of aquatics. The important requisites are courage and strength of nerve, combined with experimental knowledge of the behaviour of the body while in air and water. Do not enter the water feet first. This is only done by those who have not the courage to dive in the proper manner, and it sometimes causes harm to the respiratory organs, while one may lose balance and so come on to the water quite flat and be seriously injured in the stomach, ribs, or spine.

Object Diving.—Some divers move over the bottom in straight lines, and others search on no plan at all. The best way is to strike to the right or left on the circumference of the circle surrounding the objects and work spirally inwards to the centre of the circle. If the face be kept close to the bottom and the eyes brought well into use success will reward one's efforts, and no object ought to be missed. For object diving the drawers should have a pocket easily accessible to one hand, in order to receive the objects raised. These are collected by swimming on the breast as quickly as possible. All movements under water ought to be gone about with the utmost alacrity, but at the same time without undue haste or flurry, otherwise the heart's action will be increased, the breath will suffer, and the stay under water will be shortened.

Plate Swimming.—This is a most interesting and enjoyable branch of the art. From a very early period we find references to mechanical appliances as aids to progression and support in the water, these helps generally taking the form of large flat surfaces made of wood, tin, leather, waterproof fabrics, or other similar materials. Sometimes they were flat, in other instances slightly concave. Some were made banded like the covers of a book, or hinged, others opened and closed with umbrella like action, while quite a large number were made web-like, to resemble a duck's foot, nearly all were more or less collapsible. From what can be gleaned of the style of these articles it is evident that the inventors cannot have been familiar with the principles of swimming, or aquatic propulsive action, and so, while a number of the contrivances were undoubtedly the outcome of much thought and ingenuity, they could not be regarded as in any way improving on the ordinary or primitive swimming movements; and, while greater surface than is offered by hands and feet was always given, with the evident intention of reducing "slip," much resistance took place at the neutral or negative part of the stroke. The one good effect in most of these inventions was thus more than nullified by this "drag," which, besides being objectionable in itself, had the additional disadvantage of bringing into requisition muscles of legs and arms the development of which was antagonistic to perfection of swimming. In 1876 Mr R. H. Wallace-Dunlop, C.B., announced that he had invented swimming plates which afforded increased speed without causing undue straining of the muscles, and these claims have been justified by subsequent experience. The arrangements for a lateral movement of the heels in the footboards or plates, with freedom of the ankles, showed at once that Mr Dunlop had fully studied the details of the art of swimming, with the effect of greatly reducing "slip" in the positive and altogether doing away with "drag" in the negative parts of the leg stroke. Slow swimmers, by the use of the new appliances, move quickly and easily through the water, whilst moderately fast swimmers have their speed increased to an almost wonderful extent. To swim 100 yards in 70 seconds without artificial aid is regarded as a good performance: there are not half a dozen living swimmers who can reduce this time by so much as five seconds. Yet about ten years ago a London swimmer, not by any means the fastest, with the assistance of the plates covered the distance of 100 yards in 60 seconds. It will thus be apparent that the invention marks an important advance in the art of swimming. These plates are made of wood—mahogany or American bass,—and are in shape somewhat like an artist's palette, with this difference, that the bay or indentation of the edge runs in to where the thumb-hole would be. The straps are made of leather, and all buckles and metal should be of bronzed or lacquered brass; the woodwork ought to be kept well polished or varnished. The hand plates are at the thickest part $\frac{3}{8}$ of an inch thick, but those for the feet must be much stronger, as the whole weight of the body is upon them while one is standing at or walking to the water's edge. In learning to use them, let the swimmer begin by lying flat on the water, straightening the arms out about 24 inches apart. Spread the feet and legs well outward, then so place the feet that the plates shall be vertical, and thus offer the soles as resisting surfaces to the water; close the legs in such a way that the flat parts will meet when the legs come together. The return of the feet to the body is the same as in natural or unaided swimming, *i.e.*, by bringing them heels first so that the plates are carried up edge ways. Next, turn the ankles so as to allow of the soles facing outward, this being in plate swimming the point from which the positive or propelling part of the stroke actually starts. Now press outward and round until the plates meet as before, and repeat. Practise slowly and steadily until sure that in the recovery there is no drag, and that when spreading apart and closing the resisting surfaces are squared so as to reduce slip to its minimum. The hands are moved as in ordinary swimming, with this difference, that they are all the time lying flat, on their return to the body after the propelling movement no motion of wrist is to be made, great care being taken to keep the hand plates perfectly parallel with the surface of the water, as the slightest deviation from this rule, at any one part of the arm stroke, will sink or raise the head and chest, and so alter the natural and correct plane of the whole body. As the plates are lighter than the water the feet will tend to come close to the surface, if not indeed sometimes above it, causing splashing unless care be taken to avoid this. Floating in any position is easy and comfortable with plates on, and diving, sculling, and back swimming are all facilitated. The length of stroke in plate-swimming is nearly double that of ordinary water movements. The recommendations of the invention, especially in sea and long-distance swims, may be summed up in four words—safety, power, endurance, speed.

Long Immersions.—It is on record that on October 6, 1835, Samuel Brock, a Yarmouth fisherman, after being capsized, remained in the water for $7\frac{1}{2}$ hours before he was picked up. As a long-distance swimmer in ocean and tidal waters no one has ever approached Matthew Webb (1848–83), of the British mercantile marine service. His first great feat was plunging (April 23, 1873) off the Cunard S.S. "Russia" into a heavy sea in the unsuccessful endeavour to save a young sailor who had fallen overboard, when he passed 37 minutes in the sea before the lifeboat relieved him. He received the silver medal from the Royal Humane Society of London, the Stanhope gold medal, and a £100 purse subscribed by the passengers of the "Russia." In June 1874 he swam from Dover to the north-east Varne buoy ($9\frac{1}{2}$ sea miles). On July 3, 1875, he went from Blackwall Pier to Gravesend Town Pier on an ebb tide ($18\frac{1}{2}$ miles) in 4 h. 52 m. 44 s., and on July 19, 1875, from Dover to Ramsgate (15 sea miles) in $8\frac{3}{4}$ h. An unsuccessful attempt to swim from Dover to Calais ($17\frac{1}{2}$ sea miles) in the narrowest part of Dover Straits took place on August 12, 1875. He afterwards successfully accomplished the feat on August 24–25, 1875, after 21 h. 44 m. 55 s. immersion, the distance swum having been as nearly as possible $39\frac{1}{2}$ statute miles. A foolhardy attempt to swim the whirlpool rapids of Niagara cost Webb his life on July 24, 1883. On September 15, 1875, F. Cavil swam on the ebb of a strong spring tide from Putney to Blackwall (13 miles 3 furlongs) in 3 hr. 50 m. Miss Agnes Beckwith, of London, on the 17th July 1878, swam 20 miles in the Thames, without any assistance whatever, in 6 hours 25 minutes. Horace Davenport, of London, for years amateur champion of Great Britain, on 2d September 1884, swam from Southsea, Portsmouth, to Ryde, Isle of Wight, and back again in 5 h. 25 m.

Remarkable and Best Swimming Records.—The great majority of these have been achieved in England, but accurate statistics cannot be said to be plentiful. The following are some of the authentically recorded results.

Best Records in Open and Still Water.—100 yards, 1 m. $5\frac{1}{4}$ s.; 220 yards, 2 m. $54\frac{1}{4}$ s.; 300 yards, 4 m. 57 s.; 500 yards, 7 m. 58 s.; half-mile, 14 m. $17\frac{1}{2}$ s.; 1000 yards, 15 m. $51\frac{1}{2}$ s.; 1 mile, 28 m. $19\frac{1}{4}$ s.; 3 miles, 1 h. 53 m. 30 s.

Bath Swimming.—Of the innumerable enclosed swimming baths in Great Britain not many are exactly similar in measurement as regards length and breadth. The shorter the bath the faster becomes the time test of speed by the aid of each turn. The Lambeth bath, where the greatest number of championship and other celebrated bath races in the kingdom have been decided, is 40 yards long. The following are the best Lambeth records:—40 yards, $23\frac{1}{4}$ s.; 80

yards, $52\frac{1}{5}$ s, 100 yards, 1 m $7\frac{1}{2}$ s, 120 yards, 1 m $28\frac{1}{5}$ s, 160 yards, 2 m 2 s, 200 yards, 2 m $41\frac{1}{4}$ s, 220 yards, 2 m $59\frac{1}{4}$ s, 400 yards, 5 m $44\frac{1}{2}$ s, $\frac{1}{4}$ mile, 6 m $21\frac{1}{2}$ s, 500 yards, 7 m $19\frac{1}{4}$ s, 600 yards, 8 m $46\frac{1}{5}$ s, 800 yards, 11 m $46\frac{1}{2}$ s, $\frac{1}{2}$ mile (21 turns), 13 m $\frac{1}{5}$ s, 1000 yards, 14 m $56\frac{1}{4}$ s, 1200 yards, 18 m $5\frac{1}{2}$ s, $\frac{3}{4}$ mile, 20 m $\frac{1}{5}$ s, 1400 yards, 21 m $17\frac{1}{4}$ s, 1 mile (43 turns), 27 m $3\frac{1}{2}$ s The records of other baths include —500 yards, 6 m 55 s (Oldham Baths), 100 yards, 1 m $4\frac{1}{5}$ s (Blackburn Baths), 1 mile, 26 m 21 s (Westminster Aquarium) (80 turns)

Longest Time under Water, in Glass Tank —4 m $29\frac{1}{2}$ s

Longest Dives —109 yards 2 feet 6 inches, and 113 yards 1 foot

Longest Plunges —From a springboard 5 feet above the level surface of the water, 73 feet 1 inch, from a fixed board, 3 feet 6 inches above the water level, 76 feet 9 inches

For baths and bathing see BATHS, vol III p 434 For drowning and rescuing life, see DROWNING, vol VII p 475 There are two societies with headquarters in London which consist of delegates from nearly all the swimming clubs in the metropolis These have framed rules and regulations for the conduct of clubs, races, and other performances included under "swimming" The Professional Swimming Association was successfully floated by Mr Robert Watson on July 6, 1881 The Amateur Swimming Association was reinaugurated in 1886 by the amalgamation of the Swimming Association of Great Britain and the Amateur Swimming Union There are annual competitions for the amateur championships at 500 yards, $\frac{1}{2}$ mile, 1 mile in still water, and 5¾ miles in the Thames There are also the Associated Swimming Clubs of Glasgow and the Associated Clubs of Dundee, each similar in its objects and composition to the Amateur Swimming Association

The literature of the subject of swimming is considerable, and the following works may be mentioned Thevenot, *The Art of Swimming*, transl from the French, London, 1789, *Swimming*, two letters by Benjamin Franklin, Bungay, 1791, Walker's *Manly Sports*, art "Swimming," London, 1836, G H Cliss, *Gymnastics and Swimming*, London, 1840, W H Leverial, *Swimming and Swimmers*, London, 1861, S W Higgenson, "Swimming," in *The American and Continental Monthly*, May 1870, "Piscator," *How to Swim*, London, 1872, Charles Steedman, *Manual of Swimming*, London, 1873, Leahy, *Swimming in the Eton Style*, Nottingham, 1875, J Bell Pettigrew, *Animal Locomotion*, London, 1874, W Wilson, *Swimming, Diving, and How to Save Life*, Glasgow, 1876, Forkington, *Swimming Drill*, London, 1876, R H W Dunlop, *Plate Swimming*, London, 1877, Monstery, *New Manual of Swimming*, New York, 1878, W Wilson, *The Swimming Instructor*, 1883, J H Walsh, art "Swimming," *British Rural Sports*, London, 1886 (H F W—W WI)

SWINDON. The towns of Old and New Swindon, in Wiltshire, England, are situated on several railway lines, about 77 miles west of London and 30 east north-east of Bath The old town is built on an eminence commanding fine views of the surrounding country It received a charter for a fair from Charles I, and has weekly markets for corn and cattle The church was erected in 1851, from the designs of Sir Gilbert Scott There is a town-hall and a corn exchange Swindon New Town, to the north from Old Swindon, has grown up since the construction of the Great Western Railway, which has its principal works there There is a market house for meat, fish, and vegetables Connected with the Great Western Railway mechanics' institution there is a library of about 14,000 volumes The combined areas of Old and New Swindon, which form separate urban sanitary districts, amount to 2524 acres, with a population in 1881 of 22,374 Old Swindon (area 1214 acres) had a population in 1871 of 4092 and in 1881 of 4696, and New Swindon (area 1310 acres) a population in 1881 of 17,678

SWINE The oldest known even-toed or Artiodactyle Ungulates (see MAMMALIA, vol. xv p 429) were neither Oxen, Antelopes, Deer, Camels, nor Pigs, but presented a generalized type, which by modification in various directions has given rise to all these very diverse forms They were mostly of small size, and had invariably the full number of teeth of the typical mammalian heterodont dentition, viz, 44, of which the incisors were $\frac{3}{3}$ on each side, the canines $\frac{1}{1}$, the premolars $\frac{4}{4}$, and the true molars $\frac{3}{3}$. The molars were short and square, crowned with blunt, rounded cusps, and the canines were not remarkably developed All the feet terminated in four toes, the two middle ones (the third and fourth of the complete typical mammalian extremity) of nearly equal size, the outer ones (second and fifth) smaller, and also equal The five-toed ancestor of these forms has not yet been discovered They had no special weapons, as horns or antlers, on their foreheads Such was the condition of all the hitherto discovered animals of this division at the commencement of the Tertiary period Very early a change took place in the characters of the molar teeth in certain members of the group the rounded tubercles became sharp ridges curved in a crescentic form, and better adapted for a purely herbivorous diet, especially for cutting and bruising the comparatively dry and hard blades of grass which grow in open plains The animals thus separated from the rest —the Selenodont (crescent-toothed) Artiodactyles—have undergone various further modifications of teeth, feet, and other parts, and constitute the diverse forms of ruminating animals mentioned above Those whose molar teeth retained more of the primitive tuberculated (bunodont) form, were the ancestors of the present family of Swine, some of which, looking upon their organization as a whole, have undergone less change since the Eocene period than almost any other mammals

Remains of very generalized swine-like animals have been abundantly found in Eocene and early Miocene formations both in America and Europe In the former continent they never (as far as present evidence indicates) underwent any great diversity of modification, but gradually dwindled away and almost died out, being only represented in the actual fauna by the two closely allied species of peccary, among the smallest and most insignificant members of the group, which have existed almost unchanged since the Miocene age at least, if the evidence of teeth alone can be trusted In the Old World, on the other hand, the swine have played a more important part in recent times, having become widely distributed, and throwing off some curiously specialized forms At the present time, though not very numerous in species, they range through the greater part of the Old World except within or near the Arctic Circle, although, in common with all the other members of the great Ungulate order, they were completely absent from the whole of the Australian region until introduced by man in very recent times

The existing swine like animals may be divided naturally into three families —I *Hippopotamidæ*, II *Suidæ*, or true Pigs, III *Dicotylidæ*, or Peccaries.

I FAMILY HIPPOPOTAMIDÆ

Muzzle very broad and rounded Feet short and broad, with four subequal toes, with short rounded hoofs, all reaching the ground in walking Incisors not rooted but continuously growing, those of the upper jaw curved and directed downwards, those of the lower straight and procumbent Canines very large, curved, continuously growing, upper ones directed downwards Premolars $\frac{4}{4}$, *molars* $\frac{3}{3}$ *Stomach complex No cæcum*

This appears to be an exclusively Old-World form,—no animals belonging to it, either recent or fossil, having been found in America The family has been divided into three genera, according to the number of the incisor teeth (1) *Hexaprotodon*, incisors $\frac{3}{3}$, a type which comes nearest to the generalized or ancestral form of the group, is now extinct, being only known from the early Pliocene formations of the Sub-Himalayan range (2) *Hippopotamus* proper, incisors $\frac{2}{2}$, contains the one well-known species *H amphibius*, now confined to the rivers and lakes of Africa, but formerly (in the Pliocene period) abundantly distributed, under various minor modifications, in Europe, as far north as England Remains of an allied form have been found in the island of Madagascar, where it is now extinct (3) *Chœropsis*, incisors reduced to $\frac{2}{1}$, contains one very small and still little known species, from rivers of Liberia, West Africa, *C. liberiensis* See HIPPOPOTAMUS.

II. FAMILY SUIDÆ.

An elongated mobile snout, with an expanded, truncated, nearly naked, flat, oval terminal surface in which the nostrils are placed Feet narrow, four completely developed toes on each Hoofs of the two middle toes with their contiguous surfaces flattened. The outer (second and fifth) digits not reaching to the ground in the ordinary walking position Teeth variable in number, owing to the suppression in some forms of an upper incisor and one or more premolars

Incisors rooted. Upper canines curving more or less outwards or upwards. Stomach simple, except for a more or less developed pouch near the cardiac orifice. A cæcum. Colon spirally coiled. Confined to the Old World.

Sus.—Dentition: $i\,\frac{3}{3}$, $c\,\frac{1}{1}$, $p\,\frac{4}{4}$, $m\,\frac{3}{3}$; total 44. Upper incisors diminishing rapidly in size from the first to the third. Lower incisors long, narrow, closely approximated, and almost horizontal in position, their apices inclining towards the middle line; the second slightly larger than the first, the third much smaller.

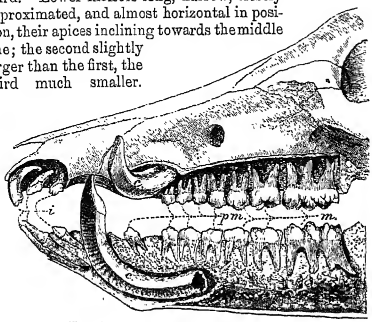

Fig. 1.—Dentition of Boar (*Sus scrofa*).

Canines strongly developed and with persistent roots and partial enamel covering, those of the upper jaw not having the usual downward direction, but curving strongly outwards, upwards, and finally inwards, while those of the lower jaw are directed upwards and outwards with a gentle backward curve, their hinder edges working and wearing against the front edges of the upper canines.[1] They appear externally to the mouth as tusks, the form of the upper lip being modified to allow of their protrusion, but are much less developed in the females than in the males. The teeth of the molar series gradually increase in size and complexity from first to last, and are arranged in contiguous series, except that the first lower premolar is separated by an interval from the second. First and second upper premolars with compressed crowns and two roots. The third and fourth have an inner lobe developed on the crown, and an additional pair of roots. The first and second true molars have quadrate crowns, with four principal obtuse conical cusps, around which numerous accessory cusps are clustered. The crown of the third molar is nearly as long (antero-posteriorly) as those of the first and second together, having, in addition to the four principal lobes, a large posterior talon or heel, composed of numerous clustered conical cusps, and supported by several additional roots. The lower molar teeth resemble generally those of the upper jaw, but are narrower. Milk dentition: $i\,\frac{3}{3}$, $c\,\frac{1}{1}$, $m\,\frac{3}{3}$; total 28,—the first permanent premolar having no predecessor in this series. The third incisor, in both upper and lower jaw, is large, developed before the others, and has much the size, form, and direction of the canine. Vertebræ: C 7, D 13–14, L 6, S 4, C 20–24. The hairy covering of the body varies much under different conditions of climate, but when best developed, as in the European wild boar, consists of long stiff bristles, mostly abundant on the back and sides, and of a close softer curling under-coat.

[1] If from any accidental circumstances these teeth are not constantly worn down by friction, they grow into a complete circle, the point penetrating the bone of the jaw close to the root of the tooth. The natives of the Fiji Islands avail themselves of this circumstance to produce one of their most valued ornaments—a circular boar's tusk: the upper canines being extracted, the lower ones are allowed to grow to the desired form.

This genus occurs at present under three principal modifications or subgenera.

A. *Sus* proper comprises a number of animals found in a wild state throughout the greater part of Europe (except where exterminated by human agency), the north of Africa, southern continental Asia, and the great islands of the Malayan archipelago, Formosa, and Japan. The following among others have been admitted by zoologists as distinct species:—*Sus scrofa*, the wild boar of Europe, Asia Minor, and North Africa, once common throughout the British Isles; *S. sennaarensis*, North-East Africa; *S. cristatus*, Hindustan; *S. vittatus*, Java, Borneo, Amboyna, Batchian; *S. barbatus*, Borneo; *S. papuensis*, New Guinea; *S. timorensis*, Timor and Rotti; *S. andamanensis*, Andaman Islands; *S. celebensis*, Celebes; *S. taivanus*, Formosa; *S. leucomystax*, Japan; *S. verrucosus*, Java, Borneo, Ceram. This list will give some idea of the geographical distribution of wild pigs, but it must be borne in mind that through the whole of this region, and in fact now throughout the greater part of the habitable world, pigs are kept by man in a domesticated state, and it is still an open question whether some of the wild pigs of the islands named above may not be local races derived originally from imported domestic specimens. In New Zealand a wild or rather "feral" race is already established, the origin of which is of course quite recent, as it is well ascertained that no animal of the kind ever lived upon the island until after its settlement by Europeans. Whether the various breeds of domestic pigs have been derived from one or several sources is still unknown. As in so many similar cases there is no historic evidence upon the subject, and the researches of naturalists, as Nathusius, Rutimeyer, Rolleston, and others, who have endeavoured to settle the question on anatomical evidence, have not led to satisfactory conclusions. It is, however, tolerably certain that all the species or forms of wild pigs enumerated above and all the domestic races are closely allied, and it is probable (though of this there has been no opportunity of proof)

Fig. 2.—Wild Boar and Young.

will breed freely together. It is a curious circumstance that the young of all the wild kinds of pigs (as far as is known at present) present a uniform coloration, being dark brown with longitudinal stripes of a paler colour, a character which completely disappears after the first few months. On the other hand, this peculiar marking is rarely seen in domestic pigs in any part of the world, although it has been occasionally observed. It is stated by Darwin that the pigs which have run wild in Jamaica

and the semiferal pigs of New Granada have resumed this aboriginal character, and produce longitudinally striped young; these must of course be the descendants of domestic animals introduced from Europe since the Spanish conquest, as before that time there were no true pigs in the New World. Another character by which the European domestic pig differs from any of the wild species is the concave outline of the frontal region of the skull, a form still retained by the feral pigs in New Zealand.[1]

B. The diminutive pig of Nepal, the Terai, and Bhutan, *Sus salvanius*, has been separated from the rest by Hodgson under the generic name of *Porcula*, but all the alleged distinctive characters prove on more careful investigation to have little real value. Owing to its retired habits, and power of concealment under bushes and long grass in the depths of the great Saul Forest, which is its principal home, very little has been known of this curious little animal, scarcely larger than a hare. The recent acquisition of living specimens in the London Zoological Gardens has, however, afforded opportunities for careful anatomical observation.[2]

C. Two well-marked species of African swine have been with more reason separated under the name of *Potamochœrus*. The dentition differs from that of true *Sus*, inasmuch as the anterior premolars have a tendency to disappear; sometimes in adult specimens the first upper premolar is retained, but it is usually absent, as well as the first and often the second lower premolars. The molar teeth are also less complex; the last especially has a much less developed heel. There are also characteristic cranial differences. The two species are very distinct in outward appearance and coloration. One is *P. africanus*, the South African River-Hog, or Bosch-Vark, of a grey colour, and the other *P. porcus* or *penicillatus*, the West African Red River-Hog, remarkable for its vivid colouring and long pencilled ears. It should be noted that the young of both these species, as well as of the pigmy *S. salvanius*, present the striped character of true *Sus*, a strong indication of close affinities, whereas in all the following forms this is absent.

Babirussa.—Dentition: $i\,\frac{2}{3}$, $c\,\frac{1}{1}$, $p\,\frac{2}{2}$, $m\,\frac{3}{3}$; total 34. The total number of teeth is therefore considerably reduced, the outer upper incisor and the two anterior premolars of both jaws being absent. The molars, especially the last, are smaller and simpler than in *Sus*, but the great peculiarity of this genus is the extraordinary development of the canines of the male. These teeth are ever-growing, long, slender, and curved, and entirely without enamel covering. Those of the upper jaw are directed upwards from their base, so that they never enter the mouth, but pierce the skin of the face, resembling horns rather than teeth, and curve backwards, downwards, and finally often forwards again, almost or quite touching the skin of the forehead. There is but one species, *B. alfurus*, found only in the islands of Celebes and Buru. Its external surface is almost entirely devoid of hair. With regard to the curiously modified dentition, Wallace (*Malay Archipelago*, i. p. 435) makes the following observations. "It is difficult to understand what can be the use of these horn-like teeth. Some of the old writers supposed that they served as hooks by which the creature could rest its head on a branch. But the way in which they usually diverge just over and in front of the eye has suggested the more probable idea, that they serve to guard these organs from thorns and spines while hunting for fallen fruits among the tangled thickets of rattans and other spiny plants. Even this, however, is not satisfactory, for the female, who must seek her food in the same way, does not possess them.

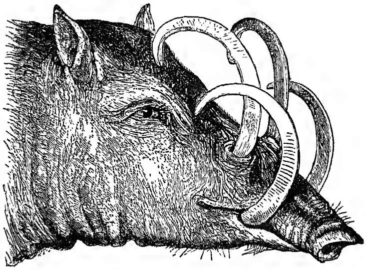

Fig. 3.—Head of Babirussa.

I should be inclined to believe rather that these tusks were once useful, and were then worn down as fast as they grew, but that changed conditions of life have rendered them unnecessary, and they now develop into a monstrous form, just as the incisors of the beaver and rabbit will go on growing if the opposite teeth do not wear them away. In old animals they reach an enormous size, and are generally broken off as if by fighting."

Phacochœrus.—The Wart-Hogs, so called from the large cutaneous lobes projecting from each side of the face, have the teeth still more remarkably modified than in *Babirussa*. The milk dentition, and even the early condition of the permanent dentition, is formed on the same general type as that of *Sus*, except that certain of the typical teeth are absent, the formula being $i\,\frac{1}{3}$, $c\,\frac{1}{1}$, $p\,\frac{3}{2}$, $m\,\frac{3}{3}$, total 34; but as age advances all the teeth have a tendency to disappear, except the canines and the posterior molars, but these, which in some cases are the only teeth left in the jaws, attain an extraordinary development. The upper canines especially are of great size, and curve outwards, forwards, and upwards. Their enamel covering is confined to the apex, and soon wears away. The lower canines are much more slender, but follow the same curve; except on the posterior surface, their crowns are covered with enamel. Unlike those of the babirussa, the canines of the wart-hog are large in both sexes. The third molar tooth of both jaws is of great size, and presents a structure at first sight unlike that of any other mammal, being composed of numerous (22–25) parallel cylinders or columns, each with pulp cavity, dentine, and enamel covering, and packed together with cement. Careful examination will, however, show that a similar modification to that which has transformed the comparatively simple molar tooth of the mastodon into the extremely complex grinder of the Indian elephant has served to change the tooth of the common pig into that of *Phacochœrus*. The tubercles which cluster over the surface of the crown of the common pig are elongated and drawn out into the columns of the wart-hog, as the low transverse ridges of the mastodon's tooth become the leaf-like plates of the elephant's.

Two species of this genus are distinguished:—*P. africanus*, Ælian's Wart-Hog, widely distributed over the continent; and *P. æthiopicus*, Pallas's Wart-Hog, confined to south-eastern Africa. In the latter species the dentition

[1] The breeding of pigs has of late years been practised with more care and skill than formerly, especially in the United States, where the "hog product" ranks with wheat and cotton as one of the leading agricultural exports. Several volumes have been published of the pedigrees of two breeds—the Berkshire and the Poland-China. The official estimate of the number of swine in the United States in 1886 is 46,000,000, and about the same number is assigned unofficially to Europe, where Servia takes the lead in proportion to population and Norway stands lowest.

[2] See Garson, *Proc. Zool. Soc. Lond.*, 1883, p. 413.

reaches its most complete reduction, as in adult specimens the upper incisors are absent and the lower ones worn down to the roots.

III. Family Dicotylidæ.

Snout as in Suidæ. *Dentition* $i\,\frac{2}{3}$, $c\,\frac{1}{1}$, $p\,\frac{3}{3}$, $m\,\frac{3}{3}$, *total* 38. *Incisors rooted; upper canines directed downwards, with sharp cutting hinder edges. Toes, four on the fore feet and three on the hind feet (the fifth wanting). Stomach complex. A cæcum. Confined to the New World.*

There is one genus, *Dicotyles*, with two species, *D. tagaçu*, the Collared Peccary, and *D. labiatus*, the White-Lipped Peccary. See Peccary. (W. H. F.)

SWINEMUNDE, a Baltic port and bathing-place on the island of Usedom in Pomerania, Prussia, is situated at the mouth of the Swine, 35 miles to the north-west of Stettin. Its broad unpaved streets and one-story houses built in the Dutch style give it an almost rustic appearance, although its industries, beyond some fishing, are entirely connected with its shipping. The entrance to the harbour, one of the best on the Prussian Baltic coast, is protected by two long breakwaters, and is strongly fortified. Swinemunde lighthouse, 216 feet high, the loftiest in Germany, rises beside the new docks on the island of Wollin, on the other side of the narrow Swine. Ships drawing not more than 16 feet can proceed to Stettin, but those of heavier burden discharge or lighten at Swinemunde, which thus stands in the relation of a fore-port to the larger city, with which it is connected by railway. Exclusive of merely passing ships, 615 vessels with a burden of 189,491 tons entered and 607 vessels with a burden of 179,336 tons cleared the port in 1880. In 1882 it possessed a fleet of 39 vessels with a burden of 5218 tons. The population in 1880 was 8478.

The Swine, the central and shortest passage between the Stettiner Haff and the Baltic Sea, was formerly flanked by the fishing villages of West and East Swine. Towards the beginning of last century it was made navigable for large ships, and Swinemunde, which was founded on the site of West Swine in 1748, was fortified and raised to the dignity of a town by Frederick the Great in 1765. In 1775 it had 1000 inhabitants, in 1816 3191.

SWINTON, a town in the West Riding of Yorkshire, is situated at the junction of the Dearne and Dove navigation with the river Don navigation, and of the South Yorkshire and Midland railway lines, 9 miles north-east of Sheffield and 8 south-west of Doncaster. In the church of St Margaret (rebuilt in 1817) two beautiful Norman arches of the old church are preserved. There are collieries, quarries, and brickfields in the neighbourhood. A large number of persons are employed in the South Yorkshire Railway establishment for the repairing of engines and waggons. There are also flint and glass-bottle works, iron-works (for stoves, grates, fenders, and kitchen ranges), and earthenware manufactures. The town was formerly renowned for its Rockingham ware, but the manufacture has been discontinued for some years. A free warren was granted to Swinton by Henry II. King John, on his march from York to Boston, slept at Swinton old hall. The population of the urban sanitary district (area 1700 acres) in 1871 was 5150, and in 1881 it was 7612.

SWINTON, a large village of Lancashire, is situated on several railway lines, 5 miles north-west of Manchester and 6 south-east of Bolton. The Swinton industrial schools, opened in February 1846, are a fine range of buildings of brick with stone facings, surrounded with grounds extending to 20 acres. The church of St Peter, a fine building of stone with a lofty western tower, was erected from the designs of Sir Gilbert Scott in 1869. The manufacture of cotton and coal mining are the chief industries. Anciently a large part of Swinton was possessed by the Knights Hospitallers of St John of Jerusalem. Swinton and Pendlebury form an urban sanitary district (area 2166 acres) under the government of a local board of twelve members; its population, estimated at 14,052 for 1871, amounted in 1881 to 18,107.

SWITHUN, St, bishop of Winchester from 852 to 862. The name of St Swithun, patron saint of Winchester cathedral from the 10th to the 16th century, is scarcely to be found in any contemporary document. His death is entered in the *Anglo-Saxon Chronicle* under the year 861; and his signature is appended to several charters in Kemble's *Codex Diplomaticus*. Of these charters three belong to 833, 838, and some year between 860 and 862. In the first the saint signs as "Swithunus presbyter regis Egberti," in the second as "Swithunus diaconus," and in the third as "Swithunus episcopus." Hence if the second charter be genuine the first must be spurious, and is so marked in Kemble.

More than a hundred years later, when Dunstan and Ethelwold of Winchester were inaugurating their church reform and supplanting the secular canons of the degenerate English foundations by monks, St Swithun was adopted as patron of the restored church at Winchester, formerly dedicated to St Peter and St Paul. His body was taken up from its almost forgotten grave outside the old monastery and transplanted to Ethelwold's new basilica on 15th July 971. Numerous miracles preceded and followed this translation. "We have seen," says one contemporary writer, "the precincts of the monastery so thronged with crowds of ailing folk that a traveller could scarcely make his way to the shrine; and yet, after some days, so numerous were the cures that even within the church itself there were scarcely five sick people to be seen." Another writer, likewise a contemporary, claims to the saint's credit two hundred cures in the short space of ten days.

The revival of St Swithun's fame gave rise to a mass of legendary literature, from which it can only be deduced that towards the end of the 10th century very little was known concerning his career. The so-called *Vitæ Swithuni* of Lantfried and Wulstan, written about this time, hardly contain the very smallest kernel of biographical fact, and all that has in later years passed for authentic detail of St Swithun's life is extracted from a biography, ascribed with much probability to Gotzelin, a monk who came over to England with Hermann, bishop of Salisbury from 1058 to 1078. From this writer, who has perhaps preserved some fragments of genuine tradition, we learn that St Swithun was born in the reign of Egbert, and was ordained priest by Helmstan, bishop of Winchester (838–*c.* 852). His fame reached the king's ears, who appointed him tutor of his son Adulphus (Ethelwulf) and numbered him amongst his chief friends. Under Ethelwulf he was appointed bishop of Winchester, to which see he was consecrated by Archbishop Ceolnoth. In his new office he was remarkable for his piety and his zeal in building new churches or restoring old ones. At his request Ethelwulf gave the tenth of his royal lands to the church. His humility was such that he made his diocesan journeys on foot; and when he gave a banquet he invited the poor and not the rich. He built near the eastern gate of his cathedral city a bridge whose stone arches were so strongly constructed that in Gotzelin's time they seemed a work "non leviter ruituros." He died 2d July 862, and gave orders that he was not to be buried within the church but outside in "a vile and unworthy place."

William of Malmesbury adds that, as Bishop Alhstan of Sherborne was Ethelwulf's minister for temporal, so St Swithun was for spiritual matters. The same chronicler uses a remarkable phrase in recording the bishop's prayer that his burial might be "ubi et pedibus prætereuntium et stillicidiis ex alto rorantibus esset obnoxius." This expression has been taken as indicating that the well-known weather myth contained in the doggrel lines—

St Swithin's day if thou dost rain
For forty days it will remain;
St Swithin's day if thou be fair
For forty days 'twill rain na mair—

had already, in the 12th century, crystallized round the name of St Swithun; but it is doubtful if the passage lends itself by any straining to this interpretation. Mr Raine has suggested that the legend is derived from the tremendous downpour of rain that occurred, according to the Durham chroniclers, on St Swithun's day, 1315 (*Hist. Dunelm.*, pp. xiii. 96–7). Another theory, more plausible, but historically worthless, traces it to a heavy shower by which, on the day of his translation, the saint marked his displeasure towards those who were removing his remains. This story, however, cannot be traced farther back than some two or three centuries at the outside, and is at variance with the 10th-century writers, who are all agreed that the translation took place in accordance with the saint's desire as expressed by vision. More probable is Mr Earle's suggestion that in the legend as now current

we have the survival of some pagan or possibly prehistoric day of augury, which has sheltered itself and preserved its vitality under the protection of an ecclesiastical saint This view is supported by the fact adduced in *Notes and Queries* (1st ser, xii p 137) that in France St Médard (June 8) and St Gervase and St Protais (June 19) are accredited with an influence on the weather almost identical with that attributed to St Swithun in England Mr Parker professes to detect a shower of rain as the symbol of St Swithun in the clog almanacs (of Queen Elizabeth's time), but Mr Earle doubts the resemblance Of other stories connected with St Swithun the two most famous are those of the Winchester egg woman and Queen Emma's ordeal The former is be found in Gotzelin's life (c 1100), the latter in Rudborne's *Historia Major* (15th century),—a work which is also responsible for the not improbable legend that this prelate accompanied Alfred on his visit to Rome in 856

The so called lives of St Swithun written by Wulstan, Lantfred, and perhaps others towards the end of the 10th century may be found in Bollandus's *Acta Sanctorum* (July), i 321–327, Mabillon's *Acta SS O B*, vi 70, &c, vii 628, &c, and Earle's *Life and Times of St Swithun*, 59, &c See also William of Malmesbury, *Gest Reg*, i 150, and *De Gest Pont*, 160, 167, 179, Florence of Worcester, i 168, Rudborne ap Wharton's *Anglia Sacra*, i 287, Hardy's *Cat of MSS*, i 513–17, Brand's *Popular Antiquities*, Chambers's *Book of Days* Ethelwulf's *Tithe Charters*, nearly all of which refer to St Swithun in the body of the text, may be studied in Haddon and Stubbs's *Councils*, iii 636–45, a comparison of the charter on page 642 with Gotzelin's life (ap Earle, 69) and William of Malmesbury (*Gest Reg*, 150, *De Gest Pont*, 160) seems to show that these charters, even if forgeries, date back at least to the 11th century, as well as the story of his being Ethelwulf's "altor et ductor"

SWITZERLAND

Part I—Geography and Statistics

Plate XII As the Swiss Confederation consists of a number of small districts, differing from each other in many points, but gathered round a common centre, originally for common defence against a common foe, it is not surprising that its political boundaries do not coincide with those of nature So we find that Ticino is south of the main chain of the Alps, a large part of the Grisons is east of the Rhine and of the ranges separating it from Tyrol, while Schaffhausen is north of the Rhine, and Porrentruy is in the French

General configuration plain far down the western slope of the Jura Putting aside these exceptional cases (all of them outside the original limits of the Confederation), the physical geography of Switzerland may be thus roughly summed up —

(1) To the south there is the main chain of the Alps, which is joined at Mont Dolent (12,566 feet) by the lower ranges running east from the east end of the Lake of Geneva, and which continues to be the boundary up to the Stelvio Pass

(2) To the north of this main chain of the Alps there is another great range, only slightly inferior in height and extent, which starts from the hills known as the Mont Jorat above Lausanne, rises in the great peaks of the Bernese Oberland and in the Todi, trends to the north near Chur, and, after rising once more to form the Santis, dies away on the south shore of the Lake of Constance

(3) The main chain of the Alps and this great north outlier are parallel to each other from Mont Dolent to near Chur, joined for a short space near the Pizzo Rotondo (west of the St Gotthard), they again part near the Oberalp Pass (east of the St Gotthard) Between these two great ranges flow two of the mightiest European rivers, the Rhine towards the east and the Rhone towards the west, their head waters being separated only by the tangled mountain mass between the Pizzo Rotondo and the Oberalp Pass

(4) To the north of the great north outlier of the main chain of the Alps there are what may be called the plains of Switzerland, really the huge undulating valley of the Aar (and its affluents), to which must be added the Thur valley between the Aar basin and the Lake of Constance

Thus, omitting the special cases named above, we may roughly describe Switzerland as consisting of two great trenches traversed by two great rivers, and enclosed by two huge mountain masses, together with the enormous valley of the Aar and the smaller one of the Thur, both these shut in by the great north outlier of the main chain of the Alps, the Rhine, and the Jura,—two deeply cut trenches, and two wide and undulating valleys

The main chain of the Alps rises in Swiss territory to the height of 15,217 feet in Monte Rosa, and its north outlier to 14,026 feet in the Finsteraarhorn The mean level of the Aar valley has been estimated at 1378 feet, its lowest point being the low-water mark of the Rhine at Basel (914 feet), the lowest level within the Confederation, however, is on the Lago Maggiore (646 feet)

Area. According to the most recent calculations, the total area of the Confederation is 15,964 2 square miles of which 71 7 per cent, or 11,443 3 square miles, are classed as "productive," 3032 square miles being covered by forests, and 132 3 square miles by vines Of the other 28 3 per cent, or 4520 9 square miles (classed as "unproductive"), 709 9 are occupied by glaciers, 520 3 by lakes, 90 by beds of rivers and streams, and 62 4 by towns, villages, and buildings Of the whole area the three great cantons of the Grisons, Bern, and Valais take up 7439 9 square miles, or nearly one-half, while, if to them be added Vaud, Ticino, and St Gall, the extent is raised to 10,552 square miles, or about two-thirds of the entire Confederation

The total area of Switzerland (15,964 2 square miles) is Rivers. distributed over four great river basins (draining to three different seas) in the following proportions —Rhine 11,166, Rhone, 2717, Po, 1358, and Inn, 721

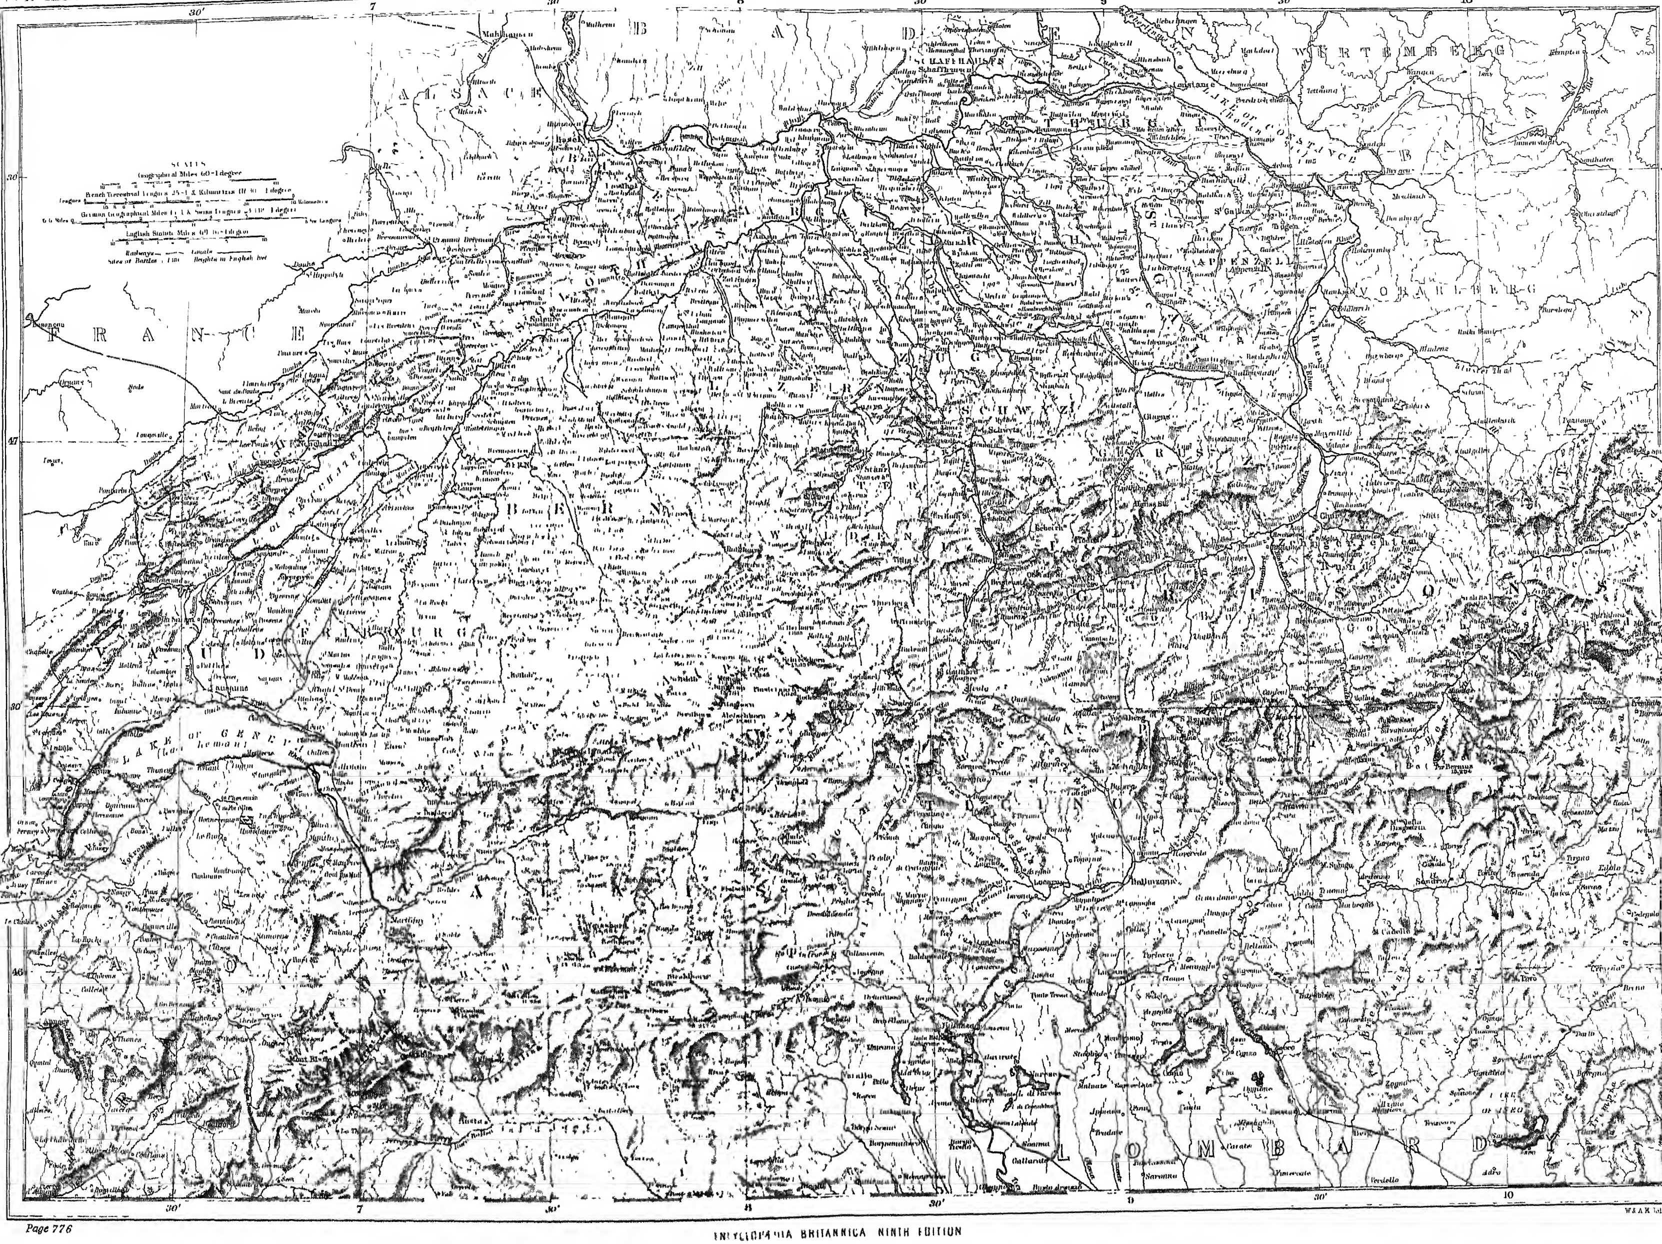
The *Rhine* basin is by far the largest in Switzerland, and drains of course to the North Sea The Rhine itself is formed of two branches,—Vorder Rhine (valley of Dissentis) and Hinter Rhine (from the Splugen and St Bernardino),—which unite at Reichenau, near Chur The joint stream receives several mountain torrents, expands into the Lake of Constance, and then turns west, receiving the Thur, and opposite Waldshut the great stream of the Aar, finally leaving Swiss territory at Basel, where it turns north Its main affluent is the Aar, the basin of which covers no less than 6794 square miles This stream rises in the glaciers of the Bernese Oberland, expands into the Lakes of Brienz and of Thun, receives from the left the Kander, the Saane, and the Zihl, and from the right the Emme, as well as (near Brugg, that great meeting place of the waters) the Reuss flowing through the Lake of Lucerne and the united stream of the Linth and the Limmat flowing through the Lakes of Wallenstadt and Zurich It is interesting historically to note the fact that the thirteen cantons which till 1798 formed the Confederation are all comprised in the Rhine basin, the ten oldest (*i e*, all before 1500) being within that of the Aar, and that it was only after 1798 that certain Romansch, French, and Italian speaking "allies" and subject lands—with their respective river basins—were tacked on The *Rhone* rises in the glacier of the same name and flows west, receiving the mountain torrents of the Visp, the Lonza, and the Dranse, besides others, expands into the Lake of Geneva, and a little way from Geneva quits Swiss territory on its way to the Mediterranean The main stream flowing from Switzerland to the *Po* basin is the Ticino (from the St Gotthard), which widens into the Lago Maggiore, another stream expands into the Lake of Lugano, and others run into the Lake of Como,—all finally joining the Po in the Lombard plains, thus draining to the Adriatic The Ramm, flowing through the Munster thal, joins the Adige and so drains into the Adriatic The *Inn* basin is composed of the upper part of the river (above Martinsbruck) and drains into the Danube and so into the Black Sea

Most of the great Swiss rivers, being in their origin mere mountain torrents, tend to overflow their banks, and hence much is required and has been done to prevent this by embanking them, and regaining arable land from them So the Rhine (between Ragatz and the Lake of Constance), the Rhone, the Aar, the Reuss, and in particular we may mention the great work on the Linth (1807 to 1822) carried out by J Konrad Escher, who earned by his success the surname of "Von der Linth," and on the Zihl near the Lakes of Neuchâtel and Bienne, while the diversion of the Kander from its junction with the Aar at Uetendorf to a channel by which it flows into the Lake of Thun was effected as early as 1714[1]

There are very many lakes in Switzerland The two largest Lakes. (Geneva and Constance) balance each other at the south west and north east corners of the Confederation The following list gives details regarding the fifteen over 4 square miles in extent It will be noticed that of these twelve are in the Rhine basin (eleven of

[1] The hydrographic bureau of Switzerland publishes annually a series of graphic tables representing the seasonal changes in the volume of all the important rivers

SWITZERLAND



them being in that of the Aar), two in the Po basin, one in the Rhone basin, and none at all in the Inn basin. It has been estimated that in the Rhine basin there are no fewer than nineteen large and thirty seven small lakes. Of the smaller Swiss lakes we may mention the Dauben See, and the Oeschinen See, as well as the Marjelen See close to the Gross Aletsch glacier. There are of course an infinite number of Alpine tarns.

Name of Lake	River Basin	Area in Square Miles	Mean Height of Surface above Sea Level in Feet	Approximate Depth in Feet
Geneva*	Rhone	223	1230 3	984 3
Constance*	Rhine	208 1	1305 8	905 5
Neuchâtel	Aar, Rhine	92 3	1427 2	472 4
Maggiore*	Ticino, Po	82 7	646 3	1230 3

Sempach	Aar, Rhine	5 4	1663 4	?
Hallwyl	Aar, Rhine	4	1483	? 1522 8

The lakes marked * are only partly in Swiss territory.

Waterfalls. There are a great number of waterfalls in Switzerland, the loftiest being that of the Staubbach (1001 feet), in the valley of Lauterbrunnen, or "Clear Springs" (Bernese Oberland). In the Oberland, too, we find the Handeck (200–220 feet), near the source of the Aar, while the Reichenbach descends in seven falls and the Giessbach in thirteen. The falls of the Rhine at Schaffhausen contain an enormous mass of water, though they are only 82 feet in height. In southern Switzerland the Pissevache fall (200 feet), in the Rhone valley, is the best known.

Glaciers. Dr A. Heim[1] reckons up 471 glaciers in Switzerland and 462 in Austria, his figures for France and Italy being untrustworthy and incomplete, but Switzerland has 138 glaciers of the first rank (*i e*, over 4¾ miles long) as against 71 in Austria, though Austria has 391 of the second rank (*i e*, between 4¾ and 3 miles long) as against 333 in Switzerland. The distribution of the Swiss glaciers deserves notice, for in eleven cantons (that is, half of those in the Confederation) there are no glaciers at all, while in five others (Unterwalden, Vaud, St Gall, Schwyz, and Appenzell) they only cover about 13 square miles out of 709 9 square miles of ice and snow in the Confederation, according to the official survey. Valais heads the list with 375 1 square miles, then come the Grisons (138 6), Bern (111 3), Uri (44 3), Glarus (13 9), and Ticino (13 1). The longest glacier in the Alps is the Gross Aletsch in the Bernese Oberland, 15 miles long, it has a basin of 49 8 square miles and a maximum breadth of 1968 yards. In point of length the Unteraar glacier comes next (10 1 miles), followed by the Gorner and Viescher glaciers (each 9 4 miles). The lowest point to which a Swiss glacier is known to have descended is 3225 feet, attained by the Lower Grindelwald glacier in 1818. Dr Heim has ascertained that the maximum annual snowfall in the Alps takes place in the lower snow regions, a conclusion which the present writer can confirm from personal experience gained on the ascent of several of the highest Oberland peaks in January 1874 and 1879. Dr Heim states that in the central Alps of Switzerland the limit of perpetual snow varies from 9259 to 9023 feet. See GLACIER.

Climate. In Switzerland, where the height above sea level varies from 646 feet (Lago Maggiore) to 15,217 feet (Monte Rosa), we naturally find very many climates, from the regions of olives, vines, oaks and beeches, pines and firs, to those of high mountain pastures, rhododendrons, and of eternal snow (see ALPS). As regards the duration of the seasons, there is a corresponding variety. It has been reckoned that, while in Italian Switzerland winter lasts only three months, at Glarus it lasts four, in the Engadine six, on the St Gotthard eight, on the Great St Bernard nine, and on the St Théodule always. A painstaking writer has calculated that, if Switzerland were flattened out into a plain, and reduced to the level of the sea, it would be comprised between the isotherms 51° 8 and 55° 4 F. As a matter of fact the mean temperature varies no less than 34½°, for at Bellinzona it is 54½° F, at Geneva 49½°, at Basel 49½°, at Chur 48¾°, at Interlaken 48°, while on the Great St Bernard it sinks to 30°, and on the St Théodule to 20°. The Alps form the boundary between the region where the rainfall is greatest in summer and that where it is greatest in autumn, the winter and spring rainfall varying but slightly. These are the percentages of the annual rainfall in Switzerland at different seasons:—

Rhine Basin	winter,	18,	spring,	25,	summer,	33,	autumn,	24
Rhone Basin	,,	21,	,,	26,	,,	26,	,,	27
Ticino Basin	,,	12,	,,	26,	,,	27,	,,	35

It has been shown by careful observations that the rain (or snow) fall is greatest as we approach the Alps, whether from the north or south, the flanks of the great ranges and the valleys opening out towards the plains receiving much more rain than the high Alpine valleys enclosed on all sides by lofty ridges. Thus the annual rainfall is 35 inches at Basel but 64½ at Beatenberg (above Interlaken) and 69 at Schwyz, rising to 88 on the Grimsel and 102 on the St Bernardino, and falling again at Lugano to 63. Dr Heim calculates that the percentage of snow in the total annual rainfall in Switzerland varies from 63 on the Great St Bernard to 6 at Geneva, the mean fall of 34 being at Platta in the Grisons. Thunderstorms generally vary in frequency with the amount of rainfall, being most common near the great ranges, and often very local. The floods caused by excessive rainfall are sometimes very destructive, as in 1839, 1852, and 1868, while the same cause leads to landslips, of which the most remarkable have been those on the Rossberg above Goldau (1806), at Evionnaz (1835), and at Elm (1881).

As regards the larger cyclones or storms of Europe, a south wind in the Alps indicates that the barometrical minimum is in the English Channel, a west wind that it is in the North Sea, a north wind that it is in the Eastern Alps, and an east wind that the depression is in the Mediterranean, about Corsica. When the barometrical minimum shifts from the Atlantic over Scandinavia to Russia, a south west wind in the Alps is followed by west and then north winds. The "föhn" is the most remarkable of the local winds in Switzerland,—a strong south west or south wind, very hot and very dry. It was formerly supposed to come from the Sahara, but is now held to be a south west or south wind which, saturated with moisture, crosses the Alps, precipitating a copious rainfall in its course, commencing its descent in the northern valleys with a high temperature for these great heights, it necessarily increases in temperature and dryness as it passes into the high pressure of lower levels. Dr Hann concludes from observation that, assuming the air to cool at the rate of 1° C in every 100 metres of ascent, and the ridge crossed by the föhn to be 2000 metres in height, the heat lost on the ascent is only 0° 5 C, so that when the föhn reaches the north side it will have a heat, not of 10°, but of 20°. The föhn occurs most frequently in spring. Other local winds in the Alps are those which blow up a valley in the morning and down it in the evening, due to the heating of the air in the valleys by the sun during the day and its cooling by terrestrial radiation at night. The cloud streamers from great Alpine peaks are due to the condensing of the moisture in a layer of air, and, as the moisture is carried away by the wind, so the streamer is dissolved.

For all these reasons Switzerland has many varieties of climate, and, while, owing to the distribution of the rainfall, the Ticino and Aar valleys are very fertile, the two great trenches between the main chain and its north outlier, though warm, are less productive, as the water comes from the rivers and not from the skies.

Mineral products. Asphalt is the only raw mineral product the export of which exceeds the import, and it is obtained only in the canton of Neuchâtel, where the output of the Val de Travers deposit in 1883 reached 28,000 tons. Though iron ores are known (according to Weber and Brosi's map) to exist in 13 localities, gold in 3, silver in 22, copper in 29, lead in 27, nickel and cobalt in 2, tin in 1, sulphur in 3, Switzerland is practically dependent for all its metals on foreign supply. While 35,161 tons of iron were obtained in 1870 (mostly from mines in the Jura), only 19,045 were obtained in 1881. True coal is wholly absent, lignites, however, occur both in the Tertiary and the Quaternary formations, the most important workings being those of Käpfnach, Utznach, Mörschwyl, Dürnten, Lutry, Conversion, and Oron. In 1870 the output was 33,364 tons, in 1881 only 6184. Anthracite occurs in Valais. Peat is common in many parts. Salt (42,000 tons) is procured from wells in Aargau, Basel, and Vaud. The first salt deposit was discovered in 1836 at Rothenhaus (Basel canton), that of Rheinfelden in 1844, of Ryburg in 1845, and of Kaiseraugst in 1865. The wells at Bex have been worked since 1554.[2]

Game. Game is not abundant in any part of Switzerland, and rigorous game laws and other devices have been adopted in order to increase the number of wild animals. In 1875 a law was passed in accordance with which a commission marked out certain reservations or "districts francs pour la chasse au gibier de montagne", and in 1881 their limits were revised for another term of five years, including an area of 5268 square kilometres in 1885. There were then within this area 8487 chamois and about 106 roebuck. The chamois were most abundant in the Grisons, Bern, Glarus, and Friburg. In the Alpine regions the marmot and Alpine hare are still common, and their numbers have increased under the protective system. Grouse, partridge, wild duck, and snipe are the

chief game birds A close time protects birds not considered game, and the federal council in 1885 appointed a commission to draw up a catalogue of all birds found in Switzerland, and to establish stations for collecting facts of ornithological interest

Fisheries

Attention has recently been directed to the diminution of the supply of freshwater fish, due in part to over fishing and in part to pollution of the streams It is estimated that the fish bearing waters in the whole country cover an aggregate area of 1581 square kilometres (1348 belonging to lakes and 233 to rivers and streams), the cantons with the greatest areas being Vaud (443 square kilometres), Bern (161), Thurgau (139), and Neuchâtel (98) Close seasons, and in certain places close years, have been established, and numerous fish-hatcheries are also in operation (57 in 1885), the species treated being mainly salmon, lake trout, river trout, grayling (ombre), red trout or Rothel, the Swiss *Coregonus*, American *Coregonus* (*C albus*), *Salmo fontinalis*, and the "mader " No fewer than 5,709,432 fish were introduced into the lakes and rivers in 1885 By a law of 1884 the federal council is allowed to defray one third of the expense of the construction of fish-ladders In 1882 a Swiss fisheries society was founded Conventions in regard to the fisheries have been signed with Italy, France, and Germany

Live-stock

Great importance attaches to the domestic animals of Switzerland In 1876 there were 284,478 owners of live stock, in 1886 289,610 The following are the numbers for those two years — horses, 100,935 and 98,333, cattle, 1,035,930, 1,211,713, sheep, 367,549, 341,632, goats, 396,055, 415,916, pigs, 334,515, 394,451, mules, 3145, 2741, asses, 2113, 2042, and beehives, 177,825, 207,180 See *Z f schw Statistik*, 1886

Table of cantons

The following table gives a variety of details regarding the twenty two Swiss cantons, arranged in the order of their extent In the first column the languages principally spoken in the different cantons are indicated by letters, as described in the appended foot note, and the percentages of population speaking them in 1880 are given In every case the official language is that of the majority, with the exception of Freiburg, where it is German The same column also shows the various executive and legislative authorities

Canton *			Date of Admission	Date of Present Constitution	Area in English Square Miles	Population 1850	Population 1880	Density per Square Mile	Deputies in National Rath	Cantonal Capital	Population of Capitals

* *Languages* —G, German F, French, I, Italian, R, Romansch *Executive Authority* —A, Regierungsrath, B, Conseil d'État, C, Consiglio di stato, D, Staatsrath, E, Standeskommission, H, Rath u Standeskommission, K, Kleiner Rath u Standeskommission *Legislative Authority* —L, Grosser Rath, M, Grand conseil, N, Gran consiglio, O, Kantonsrath, P, Landsgemeinde, Q, Landrath For details regarding the Stände Rath, of 44 members, and the National Rath, of 145 (made up as shown in column 8 above), see p 795, and for information regarding the *referendum* in the cantons, see p 796

Census returns

The first federal census of which the results were published was neither quite synchronous (April 1836 to February 1838) nor quite systematic That of 1850 took account only of the population with right of residence (*population domiciliée*), and not of the population actually present at the date of the census In 1860 the census was declared decennial The following are the numbers returned — March, 18–23, 1850, 2,392,740, December, 10, 1860, 2,507,170, December 1, 1870, 2,669,147, December 1, 1880, 2,846,102

Density of population

As regards density of population, Switzerland, with 198 5 persons to the square mile, stands considerably above Scotland (125) and a long way below England and Wales (446) The Alpine region is the sparsest generally, though certain districts, like Appenzell Ausser-Rhoden, are very densely peopled, the Jura region has a much higher ratio, and the densest region of all is the Swiss plateau If we draw an irregular line from the east end of the Lake of Geneva by Thun, Lucerne, and the south of the Lake of Zurich to Rheineck, we shall have nearly all the more densely populated portions of the country to the north, the only notable exception being what might be called the Swiss peninsula of Lugano A large proportion of the country to the south has only from 1 to 19 inhabitants to the square kilometre The districts where the density rises above 250 to the square kilometre are that to the south east and south west of Geneva, the vicinity of Lausanne, the districts of Chaux de Fonds, Neuchâtel, Biel, Bern, Soleure, Basel, a large tract along both sides of the Lake of Zurich, and the district between St Gall and Rheineck The districts in which an increase of population had taken place between 1870 and 1880 are curiously distributed An increase of 30 per cent or over occurs only in the environs of Basel and in two large areas of which the chief centres are Altdorf and Airolo Decrease was prevalent throughout a large part of the better populated regions of the north, while a certain increase had taken place throughout much of the south-western area

Vital statistics

In 1880 there were 960 8 males to every 1000 females, a rather smaller preponderance of females than in England and Wales For every 1000 above the age of 50 there are 176 unmarried females to 154 unmarried males The disproportion of the sexes in the country at large is mainly due to emigration, but in certain cantons it is partly due to excess of women in the immigrants from neighbouring countries In Uri, Schwyz, and Valais only is there an excess of males In every 1000 of the population there were, in 1860, 296 under 15 years of age, 620 between 15 and 60 years, and 84 upwards of 60, the corresponding figures in 1870 being 315, 595, and 90, and for 1880, 319, 593, and 88 The proportion of married persons to the total number of the adults (47 4 per cent) is less than in most other countries, though this proportion has been gradually raised both before and since 1880 by certain legislative changes, including the new marriage law in 1874 At the same time the average fertility of the marriages has decreased Early marriages on the part of the males are slightly more frequent than in England Divorce and separation are frequent Thus in 1876–80 they formed nearly 5 per cent of the marriages, while in Belgium and the Netherlands they do not reach 1 per cent As regards the marriage relations of the different creeds, the five years 1877–81 showed that (excluding the canton of Geneva, where the creed is not registered) there were only 0 7 separations per 1000 existing marriages where both husband and wife were Catholics, 2 8 where both were Protestants, 3 2 where the husband was a Catholic and the wife a Protestant, and 4 5 where the husband was a Protestant and the wife a Catholic

The percentage of illegitimate births during the years 1871–77 was 5 7, 5 2, 5 1, 4 8, 4 4, 5 0, and 4·9 respectively, a rate almost identical with that of England and Wales Infant mortality has been decreasing While 20·32 per cent of the quick born children of 1876 died in their first year, only 17 3 died in 1885.

The following table shows the annual number of births, &c —

	Marriages	Per 1000	Births	Per 1000	Deaths	Per 1000
1871–75	21,732	8 0	85,832	31 6	64,479	23 8
1876–80	20,740	7 4	91,197	32 5	64,671	23 1
1881–84	19,708	6 8	85,612	29 6	61,082	21 1
1885	20,105	6 8	83,579	28 6	61,548	21 0

Foreigners At the census of 1880 there were in Switzerland 211,035 foreigners (112,311 males and 98,724 females), or one foreigner to every 13 or 14 of the population The origin of this alien element was very various —from Alsace Lorraine, 2607 males, 2732 females, Germany, 43,923, 45,991, Austria-Hungary, 8389, 4929, Italy, 27,821, 13,709, Spain and Portugal, 175, 93, France, 26,264, 27,389, Holland and Belgium, 415, 493, Great Britain, 1027, 1785, Russia, 599, 685, Servia, Roumania, and Greece 119, 35, Denmark, Norway, and Sweden, 194, 188, America, 563, 548

Emigration Between 1868 and 1877 the average number of emigrants from Switzerland was 3516 per annum, between 1878 and 1882 it was 7196 In 1883, 1884, and 1885 the figures were respectively 13,502 (12,758 of them native-born Swiss), 9608, and 7583 By far the greater proportion of the emigrants found their way to America, and mainly to the United States, though some of the South American republics (as Chili) attract a considerable number In the five years 1876–80 3172 persons on an average left for North America annually, 99 for Central America, 594 for South America, and 107 for Australia, while Asia and Africa together did not count more than 167

Cities The population is to a very great extent rural Only three cities (Zurich, Geneva, and Basel) have a population exceeding 50,000, and at the census of 1880 only 59 other towns had each more than 4000 inhabitants Of these Bern (see table above), Lausanne, Chaux de Fonds (22,456), St Gall, Lucerne, Neuchâtel, Winterthur (13,595), Schaffhausen, Biel (11,623), Freiburg, Herisau (11,082), and Locle (10,464) exceeded 10,000

Religion A religious census was taken in 1850, 1860, 1870, and 1880, in the first case only three categories were recognized—Catholic, Protestant, and Jew, in 1860 and 1870 four—Catholic, Protestant, Christians of other denominations, and non Christian After much discussion the federal council, which had proposed to drop the religious census in 1880, was prevailed upon by the arguments of ten cantons to adopt a similar classification in 1880 The figures in 1870 were—1,566,347 Protestants, 1,084,369 Catholics, 11,435 members of other sects, and 6996 Jews, in 1880 the Protestants numbered 1,667,109, the Catholics 1,160,782, the Jews 7373, and miscellaneous 10,838 The Jews are most strongly represented in the cantons of Bern (1316 in 1880), Basel (1053), Aargau (1234), Zurich (806), Neuchâtel (689), and Geneva (662)

Agricultural statistics It has been estimated that, of the whole area of Switzerland, 1,612,471 acres are under arable cultivation and 1,917,632 acres in forest, while 2,866,113 acres are altogether unproductive Agricultural statistics have never been systematically registered by the federal authorities, and only a few of the cantons have devoted serious attention to the matter Herr C Muhlemann (*Z f schweiz Stat*, 1886) gives the following estimate of the area cropped and the annual value (in thousands of francs) of the produce —

	Acres	Value		Acres	Value
Wheat	153,308	36,054	Other fodder plants	15,592	2,666
Spelt	193,993	44,346	Pease and beans	9,574	1,060
Rye	86,089	18,305	Rape	1,966	186
Barley	33,610	5,057	Hemp and flax	12,163	6,101
Oats	122,615	20,468	Chicory	62	18
Potatoes	261,938	79,859	Tobacco	1,730	701
Beet and turnips	49,850	13,251	Vegetables	41,515	4,812
Carrots	16,056	3,148	Meadows, good	529,122	153,512
Mixed fodder	331,612	86,677	,, medium	609,865	82,928
Clover	217,897	66,018	,, poor	578,940	28,135
Lucerne	27,714	7,419	Pastures and "alps"	1,962,693	139,001
Esparcet	89,324	19,340	Vineyards	79,020	62,359

The value of the fruit produce is given as 127,418,391 francs (apples, 71,316,992, pears, 38,656,150)

"Allmends." The name "allmend" is given to land still held in common, whether arable, meadow, pasture, or forest The main part of the "allmends" now existing consists of pasture and forest land.

"Alps" The pasture lands, "alps," or high mountain pastures comprise "voralpen," used in the spring, "mittelalpen," or cow-pastures, and "hochalpen" (sometimes 9000 feet above the sea), for sheep and goats They are most numerous in Neuchâtel, Bern, and Grisons The capital value of the whole is estimated at 200,000,000 francs or more

Forests. Of the 3032 miles of forest land 127 3 belong to the state, 2007 1 to "communes" or private associations, and 897 to private persons The federal Government has done much to reafforest tracts, both by itself and by stimulating cantonal effort, and generally to promote the science of forestry

Industries The silk industry of Switzerland was already established at Zurich and Basel in the latter half of the 13th century, but after a period of prosperity it died out It was again introduced by the Protestants expelled from Locarno in 1555 Crape, velvet, and taffetas were the favourite products of the first stage, ribbon-weaving came later with another band of Locarno refugees and the French Huguenots In 1872 116 firms were engaged in the silk trade, in 1881 134 Between those dates the employees had increased from 39,940 to 49 816 (65,000 in 1883), and the wages from 15,382,186 to 19,815,453 francs In 1881 2,153,100 kilos of raw silk and 1 067,700 of silk waste were imported, and the export of silk goods, ribbons, and ferret silk was 1,152,300, 1,965,400, and 819,000 kilos respectively Cotton began to be manufactured in Switzerland in the 15th century, and power-loom weaving was introduced in 1830 The industry has owed a good deal to the abundant water power of the country In 1881 there were about 23,000 cotton looms, and cotton spinning employed about 60,000 spindles The workers numbered 88,046 in 1883 Bleaching and cloth dressing have attained a great development in the neighbourhood of St Gall, both in the cantons of St Gall and Appenzell Printworks are especially numerous in Glarus Aargau is the chief seat of the woollen manufacture, having 4 millions of the total production valued at 11½ million francs Linen, the first of the Swiss textile fabrics to find its way to a foreign market, is no longer manufactured on a large scale Embroidered goods are the great specialty of the export trade of eastern Switzerland,—the cantons of St Gall, Appenzell, Thurgau, and part of Zurich In flat-stitch machine embroidery 15,256 workers were employed in 1872, and 27,801 in 1880 (43 and 47 per 1000 inhabitants) In the different departments of hand embroidery 33,359 persons were employed in 1881 The St Gall market is also supplied by a large number of workers in Vorarlberg The value of the embroidered goods exported from the consular district of St Gall for America alone increased from 19 to nearly 30 million francs between 1879 and 1882 Straw plaiting is an important industry in Aargau (centre at Wohlen), Ticino, and Freiburg In 1867–68, when the trade was at its best, the total export was worth 10½ million francs Watch and clock making is a specially Swiss industry, giving employment to 44,000 workers in 1883 In Geneva alone 296 establishments were at work in 1882 in some department or other of the manufacture The valley of Joux (Vaud and Saint Croix), Chaux de Fonds, Locle, Les Brenets, Les Ponts, Fleurier (Neuchâtel), Bienne, Porrentruy, Saint Imier (Bern), Granges (Soleure), Waldenburg (Basel), and Schaffhausen are all important seats of the craft The condensed milk industry of Switzerland is also well known The exports in 1875 amounted to 4,261,800 kilos, and in 1883 to 12,086,900 A similar article is Nestlé's infants' food from Vevey Swiss cheese (Emmenthal and Gruyère) has a widespread reputation, the export increased from 5,093,100 kilos in 1851 to 25,959,400 in 1883 The production of beer in Switzerland was 6,160,000 gallons in 1867 and 20,240,000 in 1882, in the latter year 289,561 gallons were exported The distilleries (1006) produce about 990,000 gallons of pure alcohol annually Allusion can only be made here to the great chemical industries of the country, its potteries, paper mills, engineering works, gun factories, &c

Wood carving was one of the most ancient, as it is now one of the best known, of the minor arts of Switzerland The great seat of the modern industry is the Bernese Oberland, where the peasants during the long evenings of winter for centuries devoted themselves to producing artistic articles in wood It was regularly organized by Christian Fischer in Brienz (1825), and is now mainly in the hands of a company, founded in 1881, which associates capitalists and workmen in the profits In 1870 1139 men and 56 women were employed throughout Switzerland in this department, in 1880 the numbers were 1202 and 105 [1]

Wooden houses Owing to the original abundance of timber it was almost the only material employed in the building of houses There are practically three styles the so called block house, in which the logs are laid one upon the other, the post built house, in which upright posts and a strong framework are filled in with planks, and the "riegelhaus," in which a framework of wood is filled in with brick or stones In the cantons of Zurich, Thurgau, and Schaffhausen the riegelhaus (the usual form in southern Germany) has—chiefly owing to the increased cost of timber—displaced the two other styles, which alone were in use there till the beginning of the 17th century [2]

Health stations In Gsell Fels's *Bäder u klimatische Kurorte der Schweiz* (1880), 505 health stations are mentioned In Aargau we have the hot springs of Baden and Schinznach (sulphur), the salt baths of Rheinfelden and Mumpf, the mineral waters of Wildegg and Birmensdorf In Appenzell there are a number of places between

[1] See Rahn, *Gesch der bildenden Künste in der Schweiz*, Salvisberg, *Die Holzschnitzerei des Berner Oberlandes*, and Davinet, *Bericht über Holzschnitzerei*, 1884

[2] See Gladbach, *Die Holz Architectur der Schweiz* 1885, Graffenried and Stürler, *Architecture Suisse*; Hochstätter, *Schweizer Architektur*, Varin, *L'Architecture pittoresque en Suisse*, and Gladbach, *Der Schweizer Holzstyl*

2000 and 3000 feet above the sea famous as whey cure stations (Heiden, Gais, Appenzell, &c), and various chalybeate springs (Weissbad, Gonten, Heinrichsbad) Basel contains salt baths at Schweizerhalle, Bienenberg, and Schauenburg Bern is particularly rich in baths and sanatoriums (Lenk, Weissenburg, Heustrich, Gurnigel, Engistein, Blumenstein) Schwarzseebad is the chief mineral spring in Freiburg, Pfaffers-Ragatz in St Gall is world famous The Stachelberger Schwefelbad in Glarus is much frequented The Grisons have almost a superfluity of mineral waters, some of which (St Moritz, Fideris) are exported in large quantities Weissenstein in Soleure is one of the oldest sanatoriums in Switzerland Lavey and Bex in Vaud are respectively famous for their sulphur and salt baths In Valais, Saxon and Leukerbad are famous The importance of altitude in the attractiveness of a health resort is shown in a table by Guyer, 230 of the hotels for foreign visitors being upwards of 3900 feet above the sea Dr F Stopel (*Industrie u Handelspolitik der Schweiz*, 1876) reckoned the total receipts from foreign visitors at 120,000,000 francs

Commerce The position taken by Switzerland in the trade and commerce of the world is remarkable when the various natural obstacles are considered—such as absence of raw material for her industries, costly and difficult means of transport, and restrictive customs established by neighbouring countries The following table shows the value in thousands of francs of the imports and exports for 1885 (the first year for which we have official returns) —

	Imports	Exports		Imports	Exports
Germany	249,262	157,620	Russia	21,318	9,181
France	179,195	139,670	United States	17,842	77,723
Italy	112,095	60,316	Egypt	12,217	2,188
Austria Hungary	65,603	37,726	Holland	9,286	5,879
Great Britain and Ireland	51,604	99,396	Other countries	10,658	56,889
Belgium	26,372	13,076	Total	755,452	659,964

England is the great market for silver watches, Germany for gold watches and musical boxes, France for weaving machinery, Russia for mills, Italy for miscellaneous machinery, France for asphalt, France for butter, France, Italy, Germany, and the United States for cheese, Germany for silk, Germany for cattle, France for sheep and goats Cotton manufactures find their way to France, Italy, Austria, Britain, Germany, Spain, India, &c, leather to the United States and the Argentine Republic The customs increased from 3,953,192 francs in 1850 to 21,342,403 in 1884

Education By article 27 of the federal constitution of 1874, primary instruction, while left in the charge of the several cantons, is required to be sufficient, obligatory, gratuitous, unsectarian, and under public control of the state The primary school age is up to twelve years, as far as this general law is concerned, but in some cantons this is raised to fourteen, fifteen, or sixteen years of age The first school year also varies from five to seven in different cantons Great variety indeed exists in the whole school organization of the several cantons, while the chief authority as regards the primary schools is in some cases vested in an educational department or educational council, or both, in others it is entrusted to an educational director with or without a council Considering the difficulties caused in many regions by a sparse population and a rugged country, primary instruction is well carried out Funds are provided by the state, the commune, and often by the private individual Even in remote districts the school buildings are generally good Bern has been especially active in building new schools In 1882 218,191 boys and 215,889 girls attended the primary schools Of these 311,271 had German as their mother tongue, 97,113 French, 19,864 Italian, and 5832 Romansch The total number of male teachers was 5840, and of female teachers 2525, the average pay in money per male teacher was 1308 francs, for female teachers 822 francs The primary school property was valued at 137,534,597 francs (86,647,507 in 1871) The expense was 14,781,610 francs (8,708,174 in 1871) The communes contributed 8,349,697 francs and the state 2,825,722 The expense per scholar was 34 1 For the school children who are too poor to obtain proper food and clothing both public and private assistance is freely rendered Besides the ordinary public primary schools, there are a considerable number of secondary schools (attended in 1882 by 11,155 boys and 8976 girls), preparatory (or intermediate) schools (9556, 2133), infant schools (10,864, 11,212), schools for adults (12,758, 1110), and private schools (6057, 4834) In 1882 there were in all 272,039 males and 244,896 females in receipt of education Among the preparatory schools are the "colleges" or "gymnasiums" and the industrial schools, one of which exists in almost all the cantonal capitals as well as at Winterthur, Burgdorf, Porrentruy, Einsiedeln, Murten, and Brieg In Grisons and Neuchâtel normal schools for the education of teachers are attached to the cantonal schools Separate establishments for this purpose exist in the cantons of Zurich, Bern, Lucerne, Schwyz, Freiburg, Soleure, St Gall, Aargau, Thurgau, Tessin, Vaud, and Valais Among the more specialized institutions of the preparatory or middle class are the *Technikum* at Winterthur, the veterinary colleges at Zurich and Bern, the agricultural schools at Oberstrass and Rutli, and the school of dentistry at Geneva In the four universities of Basel, Bern, Zurich, and Geneva, each with faculties of law, theology, medicine, and arts (philosophy), the average number of matriculated students per session of six months was, between 1876 (the first year of the Geneva university) and 1881, in theology 113, in law 188, in medicine 469, and in arts 288,—a total of 1058, to which must be added 334 non matriculated Basel has a preponderance in theology, Bern in law, Zurich in arts The great federal polytechnicum at Zurich (opened in 1855) comprises schools of architecture, civil and industrial engineering, industrial chemistry, forestry, and agriculture [1]

Libraries The public libraries of Switzerland are briefly described in vol xiv p 528, as they existed in 1868 (*cf* p 548), for the learned societies, see SOCIETIES

Finance The total revenue of the Confederation, which was only 22,049,353 francs in 1869, had increased to 44,308,000 on an average in 1879–1883, and reached 48,392,000 in 1885, the expenditure, which was 21,744,459 at the first date, had correspondingly increased to 43,312,510 in 1879–1883, and 46,278,685 in 1885

Army In Switzerland there is no standing army, but every male citizen between twenty four and forty four years of age is bound to military service and drill The federal forces consist of the *Auszug, Élite*, or regular army (men from twenty to thirty two years old), and the landwehr (men thirty two to forty four years) The whole army was reorganized in 1874, when extensive functions were assigned to the military physician in connexion with the recruiting and calling out of the soldiers In the ten years 1875–84 there was one new recruit for 111 of the population (foreigners excepted), 49 per cent of the total were declared fit for service, 19 per cent remanded, and 32 per cent declared unfit In the long run, about 61 1 per cent of the young men of the country passed the standard In 1886 the regulars numbered 117,179 and the landwehr 84,046 [2]

Railway Railway construction, which began in 1844, proceeded in earnest after the new legislation of 1852, and by the close of 1862 718 miles had been constructed, by 1872 the ordinary lines reached a total of 1459 miles, with 5 miles of special lines, for 1882 the corresponding figures were 2667 and 81 The annual railway profits increased from 105,599,970 francs in 1870–74 to 179,151,112 in 1880–84 Tramways began to be laid down in 1862, and rope railways in 1877 The railways are mostly in the northern plateau and connect with the systems of Northern Europe The only Swiss line which crosses to the south of the Alps is the St Gotthard (see RAILWAYS) The proposed Simplon railway has already been carried up the Rhone valley as far as Brieg The mountainous character of the country and the special exigencies of its traffic have successfully stimulated to some striking efforts of railway engineering Thus the Rigi railway rises from the Lake of Lucerne to a height of 5739 feet, with a maximum gradient of 250 per thousand, that of the Rorschach-Heiden line is 50 per thousand

Roads Switzerland is famous for its well made and well kept carriage roads Some of those that traverse the mountain passes have been constructed at great expense One of the most remarkable is the mule path down an almost perpendicular rock from the Gemmi Pass to Leukerbad, made in 1737–40

Post office. Bern has been the seat of the international Postal Union since 1874 (see POST OFFICE, vol xix p 584) The federalization of the national post office dates from 1848,—the different cantons having previously conducted their postal business according to very different methods It is to be noted that this department charges itself with the conveyance of passengers as well as mails,—these numbering 831,839 in 1880 and 754,365 in 1885 For other details see the table given in vol xix p 585

Telegraphs The length of telegraph lines increased from 1920 kilometres in 1852 to 6874 in 1884 (wires from 1920 to 16,618 kilometres), and the number of despatches from 2876 in 1852 to 1,127,311 in 1884, the total receipts for the latter year being 2,555,687 francs

Banks In Switzerland there are thirty three legalized banks of issue, their average circulation of notes in 1885 was to the value of 123,431,000 francs There are 325 savings banks proper (deposits 246,359,735 francs in 1882) and 162 other institutions which receive deposits (267,298,548 francs in 1882) Most of these are in the hands of companies or private merchants.

Besides the older but valuable works of Faber (1756), Fasi (1765 68), Fussli (1770 72), Normann (1795 98), Durand (1795 96), Meister (1796), see *Hist geogr statistische Gemalde der Schweiz* (a series of monographs, published by Huber and Co of St Gall and Bern), Hottinger, *Staatshaushalt der schweiz Eidgen*, 1847, Franscini *Stat della Svizzera*, Lugano, 1827 and 1847–49, Wirth, *Allgemeine Beschreibung der Schweiz*, Legoyt and Vogt, *La Suisse*, Prof Egli's most convenient *Taschenbuch* (1878, &c) and *Schweizerkunde*, Berlepsch, *Schweizerkunde*, 1875, and Furrer's comprehensive *Volkswirthschaft Lexicon* A statistical bureau was founded in 1860, a statistical society in 1864 Dr Kummer gives a history of Swiss statistics in *Zeitschrift fur schweiz Stat*, 1885, and his successor, Herr Milliet, to whom we are indebted for much of the above information, is engaged on a statistical handbook (W A B C—H A W)

[1] See especially C Grob, *Statistik uber das Unterrichtswesen in der Schweiz*, 7 parts, 1883, and Dr H Wettstein, *Bericht uber Gruppe 30, Unterrichtswesen* (Zurich Exhibition), 1884

[2] Details may be found in the *Almanach de Gotha*, 1887

PART II.—HISTORY

The Swiss Confederation is made up of twenty-two small states, differing from each other in nearly every point,—religious, political, social, industrial, physical, and linguistic; yet it forms a nation the patriotism of whose members is universally acknowledged. History alone can supply us with the key to this puzzle; but Swiss history, while thus essential if we would thoroughly grasp the nature of the Confederation, is very intricate and very local. A firm hold on a few guiding principles is therefore most desirable, and of these there are three which we must always bear in mind. (1) The first to be mentioned is *the connexion of Swiss history with that of the empire*. Swiss history is largely the history of the drawing together of bits of each of the imperial kingdoms (Germany, Italy, and Burgundy) for common defence against a common foe—the Hapsburgs; and, when this family have secured to themselves the permanent possession of the empire, the Swiss League little by little wins its independence of the empire, practically in 1499, formally in 1648. Originally a member of the empire, the Confederation becomes first an ally, then merely a friend. (2) The second is *the German origin and nature of the Confederation*. Round a German nucleus (the three Forest districts) there gradually gather other German districts; the Confederation is exclusively German; and it is not till 1803 and 1815 that its French- and Italian-speaking "subjects" are raised to political equality with their former masters, and that the Romansch-speaking Leagues of Rhætia (Graubunden) pass from the status of an ally to that of a member of the Confederation. Even now, though by the constitution three languages (German, French, and Italian) are recognized as official, the overwhelming majority of the population of the Confederation is German-speaking (2,030,792 out of 2,846,102 in 1880), and the capital was fixed at Bern by a law of 1848, having previously shifted between various German-speaking towns, while in olden days the diet always met in some German-speaking place. (3) Swiss history is *a study in federalism*. Based on the defensive alliances of 1291 and 1315 made between the three Forest districts, the Confederation is enlarged by the admission of other districts and towns, all leagued with the original three members, but not necessarily with each other. Hence great difficulties are encountered in looking after common interests, in maintaining any real union; the diet was merely an assembly of ambassadors with powers very strictly limited by their instructions, and there was no central executive authority. The Confederation is a *Staatenbund*, or permanent alliance of several small states. After the break-up of the old system in 1798 we see the idea of a *Bundesstaat*, or an organized state with a central legislative, executive, and judiciary, work its way to the front, an idea which is gradually realized in the constitutions of 1848 and 1874. The whole constitutional history of the Confederation is summed up in this transition to a federal state which, while a single state in its relations with all foreign powers, in home matters carefully maintains the more or less absolute independence of its several members.

Swiss history falls naturally into five great divisions: I. the origins of the Confederation—up to 1291[1]; II. the shaking off dependence on the Hapsburgs—up to 1394 (1474); III. the shaking off dependence on the empire—up to 1499 (1648); IV. the period of religious divisions and French influence—up to 1814; V. the construction of an independent state as embodied in the constitutions of 1848 and 1874.

I. On August 1, 1291, the men of the valley of Uri ("homines vallis Uranie"), the free community of the valley of Schwyz ("universitas vallis de Switz"), and the association of the men of the lower valley or Nidwald ("communitas hominum intramontanorum vallis inferioris") formed an Everlasting League for the purpose of self-defence against all who should attack or trouble them, a league which is expressly stated to be a confirmation of a former one ("antiquam confederationis formam juramento vallatam presentibus innovando"). This League was the foundation of the Swiss Confederation.

Early history of the Three Lands.

What were these districts? and why at this particular moment was it necessary for them to form a defensive league? The legal and political conditions of all differed. (*a*) In 853 Louis the German granted (*inter alia*) all his lands (and the rights annexed to them) situated in the "pagellus Uroniæ" to the convent of Sts Felix and Regula in Zurich (the present Fraumunster) of which his daughter Hildegard was the first abbess, and gave to this district the privilege of exemption from all jurisdiction save that of the king (*Reichsfreiheit*). The abbey thus became possessed of the greater part of the valley of the Reuss between the present Devil's Bridge and the Lake of Lucerne, for the upper valley of Urseren belonged at that time to the abbey of Dissentis in the Rhine valley, and did not become permanently allied with Uri till 1410. The privileged position of the abbey tenants gradually led the other men of the valley to "commend" themselves to the abbey, whether they were tenants of other lords, or free men as in the Schächenthal. The meeting of all the inhabitants of the valley, for purposes connected with the customary cultivation of the soil according to fixed rules and methods, served to prepare them for the enjoyment of full political liberty in later days. The important post of "protector" (advocatus or vogt) of the abbey was given to one family after another by the emperor as a sign of trust; but, when, on the extinction of the house of Zaringen in 1218, the office was granted to the Hapsburgs, the protests of the abbey tenants, who feared the rapidly rising power of that family, and perhaps also the desire of the emperor to obtain command of the St Gotthard pass (of which the first authentic mention occurs about 1236, when of course it could only be traversed on foot), led to the recall of the grant in 1231, the valley being thus restored to its original privileged position, and depending immediately on the emperor. (*b*) In Schwyz we must distinguish between the districts west and east of Steinen. In the former the land was in the hands of many nobles, amongst whom were the Hapsburgs; in the latter there was, at the foot of the Mythen, a free community of men governing themselves, and cultivating their land in common; both, however, were politically subject to the emperor's delegates, the counts of the Zurichgau, who after 1173 were the ever-advancing Hapsburgs. But in 1240 the free community of Schwyz obtained from the emperor Frederick II. a charter which removed them from the jurisdiction of the counts, placing them in immediate dependence on the emperor, like the abbey men of Uri. In a few years, however, the Hapsburgs contrived to dispense with this charter in practice. (*c*) In Unterwalden things were very different. The upper valley (Obwald or Sarnen, so called because of its position with regard to the Kernwald) formed part of the Aargau, the lower (Nidwald or Stanz) part of the Zurichgau, while in both the soil was owned by many ecclesiastical and lay lords, among them being the Hapsburgs and the Alsatian abbey of Murbach. Hence in this district there were no privileged tenants, no free community, no centre of unity, and this explains why Obwald and Nidwald won their way upward so much more slowly than their neighbours in Uri and Schwyz. Thus the early history and legal position of these three districts was very far from being the same.

[1] For the legendary origin, see TELL.

In Uri the Hapsburgs, save for a brief space, had absolutely no rights, while in Schwyz, Obwald, and Nidwald they were also, as counts of the Zurichgau and of the Aargau, the representatives of the emperor.

The League of 1291

The Hapsburgs had been steadily rising for many years from the position of an unimportant family in the Aargau to that of a powerful clan of large landed proprietors in Swabia and Alsace, and had attained a certain political importance as counts of the Zurichgau and Aargau. In one or both qualities the cadet or Lauffenburg line, to which the family estates in the Forest districts round the Lake of Lucerne had fallen on the division of the inheritance in 1232, seem to have exercised their legal rights in a harsh manner. In 1240 the free men of Schwyz obtained protection from the emperor; in 1244 the Hapsburgs built the castle of New Hapsburg on a promontory jutting out into the lake not far from Lucerne, with the object of enforcing their real or pretended rights. It is therefore not a matter for surprise that, when, after the excommunication and deposition of Frederick II by Innocent IV at the council of Lyons in 1245, the head of the cadet line of Hapsburg sided with the pope, the men of the Forest districts should rally round the emperor. Schwyz joined Sarnen, Nidwald helped Lucerne, the castle of New Hapsburg was reduced to its present ruined state, and in 1248 the men of Schwyz, Sarnen, and Lucerne were threatened by the pope with excommunication if they persisted in upholding the emperor and defying their hereditary lords the counts of Hapsburg. The rapid decline of Frederick's cause soon enabled the Hapsburgs to regain their authority in these districts. Yet these obscure risings have a double historical interest, for they are the foundation in fact (so far as they have any) of the legendary stories of Hapsburg oppression told of and by a later age, and these fleeting alliances are doubtless what is represented by the "antiqua confederatio" of 1291, Schwyz already taking the lead, while Uri, secure in its privileged position, contented itself with giving a moral support to its neighbours. After this temporary check the power of the Hapsburgs continued to increase rapidly. In 1273 the head of the cadet line sold all his lands and rights in the Forest districts to the head of the elder or Alsatian line, Rudolph, who a few months later was elected to the imperial throne, in virtue of which he acquired for his family in 1282 the duchy of Austria, which now for the first time became connected with the Hapsburgs. Rudolph recognized the privileges of Uri but not those of Schwyz, and, as he now united in his own person the characters of emperor, count of the Zurichgau and of the Aargau, and landowner in the Forest districts (a name occurring first in 1289), such a union of offices might be expected to result in a confusion of rights. On April 16, 1291, Rudolph bought from the abbey of Murbach in Alsace (of which he was "advocate") all its rights over the town of Lucerne and the abbey estates in Unterwalden. It thus seemed probable that the other Forest districts would be shut off from their natural means of communication with the outer world by way of the lake. Rudolph's death, on July 15 of the same year, cleared the way, and a fortnight later (August 1) the Everlasting League was made between the men of Uri, Schwyz, and Nidwald (the words "et vallis superioris," *i.e.*, Obwald, were inserted later on the original seal of Nidwald) for the purpose of self-defence against a common foe. We do not know the names of the delegates of each valley who concluded the treaty, nor the place where it was made, nor have we any account of the deliberations of which it was the result. The common seal—that great outward sign of the right of a corporate body to act in its own name without needing to ask the permission of any external authority—appears first in Uri in 1243, in Schwyz in 1281, in Nidwald not till this very document of 1291; yet, despite the great differences in their political status, they all joined in concluding this League, and confirmed it by their separate seals, thereby laying claim on behalf of their union to an independent existence. Besides promises of aid and assistance in the case of attack, they agree to punish great criminals by their own authority, but advise that, in minor cases and in all civil cases, each man should recognize the "judex" to whom he owes suit, engaging that the confederates will, in case of need, enforce the decisions of the "judex." At the same time they unanimously refuse to recognize any "judex" who has bought his charge or is a stranger to the valleys. All disputes between the parties to the treaty are, as far as possible, to be settled by a reference to arbiters, a principle which remained in force for over six hundred years. "Judex" is a general term for any local official, especially the chief of the community, whether named by the lord or by the community; and, as earlier in the same year Rudolph had promised the men of Schwyz not to force upon them a "judex" belonging to the class of serfs, we may conjecture from this very decided protest that the chief source of disagreement was in the matter of the jurisdictions of the lord and the free community, and that some recent event in Schwyz led it to insist on the insertion of this provision. It is stipulated also that every man shall be bound to obey his own lord "convenienter," or so far as is fitting and right.

Morgarten and the League of 1315

II. In the struggle for the empire, which extended over the years following the conclusion of the League of 1291, we find that the Confederates support without exception the anti-Hapsburg candidate. On October 16, 1291, Uri and Schwyz ally themselves with Zurich, and join the general rising in Swabia against Albert, the new head of the house of Hapsburg. It soon failed, but hopes revived when in 1292 Adolf of Nassau was chosen emperor. In 1297 he confirmed to the free men of Schwyz their charter of 1240, and, strangely enough, confirmed the same charter to Uri, instead of their own of 1231. It is in his reign that we have the first recorded meeting of the "landsgemeinde" (or assembly) of Schwyz (1294), that of Uri being heard of as early as 1275. But in 1298 Albert of Hapsburg himself was elected to the empire. His rule was strict and severe, though not oppressive. He did not indeed confirm the charters of Uri or of Schwyz, but he did not attack the ancient rights of the former, and in the latter he exercised his rights as a landowner and did not abuse his political rights as emperor or as count. In Unterwalden we find that in 1304 the two valleys were joined together under a common administrator, a great step forwards to permanent union. The stories of Albert's tyrannical actions in the Forest districts are not heard of till two centuries later, though no doubt the union of offices in his person was a permanent source of alarm to the Confederation. It was in his time too that the "terrier" (or list of manors and estates, with enumeration of all quit rents, dues, &c., payable by the tenants to their lords) of all the Hapsburg possessions in Upper Germany was begun, and it was on the point of being extended to Schwyz and Unterwalden when Albert was murdered (1308) and the election of Henry of Luxemburg roused the free men to resist the officials charged with the survey. Despite his promise to restore to the Hapsburgs all rights enjoyed by them under his three predecessors (or maintain them in possession), Henry confirmed, on June 3, 1309, to Uri and Schwyz their charters of 1297, and, for some unknown reason, confirmed to Unterwalden all the liberties granted by his predecessor, though as a matter of fact none had been granted. This charter, and the nomination of one imperial bailiff to administer the three districts, had the

effect of placing them all (despite historical differences) in an identical political position, and that the most privileged yet given to any of them,—the freedom of the free community of Schwyz. A few days later the Confederates made a fresh treaty of alliance with Zurich, and in 1310 the emperor placed certain other inhabitants of Schwyz on the same privileged footing as the free community. The Hapsburgs were put off with promises, and, though their request (1311) for an inquiry into their precise rights in Alsace and in the Forest districts was granted, no steps were taken to carry out this investigation. Thus in Henry's time the struggle was between the empire and the Hapsburgs as to the recognition of the rights of the latter, *not* between the Hapsburgs and those dependent on them as landlords or counts.

On Henry's death in 1313 the electors hesitated long between Frederick the Handsome of Hapsburg and Louis of Bavaria. The men of Schwyz seized this opportunity for making a wanton attack on the great abbey of Einsiedeln, with which they had a long-standing quarrel as to rights of pasture. The abbot caused them to be excommunicated, and Frederick (the choice of the minority of the electors), who was the hereditary "advocate" of the abbey, placed them under the ban of the empire. Louis, to whom they appealed, removed the ban, on which Frederick issued a decree by which he restored to his family all their rights and possessions in *the three valleys* and Urseren, and charged his brother Leopold with the execution of this order. The Confederates hastily concluded alliances with Glarus, Urseren, Art, and Interlaken to protect themselves from attack on every side. Leopold collected a brilliant army at the Austrian town of Zug in order to attack Schwyz, while a body of troops was to take Unterwalden in the rear by way of the Brunig pass. On November 15, 1315, Leopold, with from 15,000 to 20,000 men, moved forward along the shore of the Lake of Egeri, intending to assail the village of Schwyz by climbing the steep hillside above the southern end of the lake, through the narrow pass of Morgarten between the mountain and the lake. At the summit of the pass waited the valiant band of the Confederates, from 1300 to 1500 strong. The march up the rugged and slippery slope threw the Austrian army into disarray, which became a rout and mad flight when huge boulders and trunks of trees were hurled from above by their foes, who charged down on them, and drove them into the lake. No fewer than 1500 Austrians fell; their brilliant cavalry had completely failed before the onset of the lightly armed Swiss footmen. Leopold fled in hot haste to Winterthur, and the attack by the Brunig was driven back by the men of Unterwalden. On December 9, 1315, representatives of the victorious highlanders met at Brunnen, on the Lake of Lucerne, not far from Schwyz, and renewed the Everlasting League of 1291. In their main lines the two documents are very similar, the later being chiefly an expansion of the earlier. That of 1315 is in German (in contrast to the 1291 League, which is in Latin), and has one or two striking clauses largely indebted to a decree issued by Zurich on July 24, 1291. None of the three districts or their dependents is to recognize a new lord without the consent and counsel of the rest (this is probably meant to provide for an interregnum in or disputed election to the empire, possibly for the chance of the election of a Hapsburg), strict obedience in all lawful matters is to be rendered to the rightful lord in each case, unless he attacks or wrongs any of the Confederates, in which case they are to be free from all obligations; no negotiations, so long as the "Lander" have no lord, are to be entered on with outside powers, save by common agreement of all. Louis solemnly recognized and confirmed the new League in 1316, and in 1318 a truce was concluded between the Confederates and the Hapsburgs, who treat with them on equal terms. The lands and rights annexed belonging to the Hapsburgs in the Forest districts are fully recognized as they existed in the days of Henry of Luxemburg, and freedom of commerce is granted. But there is not one word about the *political* rights of the Hapsburgs as counts of the Zurichgau and Aargau. This distinction gives the key to the whole history of the relations between the Confederates and Hapsburgs, the rights of the latter as landowners are fully allowed, and till 1801 they possessed estates within the Confederation, it is their political rights which are always contested by the Swiss, who desire to rule themselves, free from the meddling of any external power.

The League of eight members

As early as 1320 we find the name "Swiss" (derived from Schwyz, which had always been the leader in the struggle) applied to the Confederation as a whole, though it was not till after Sempach (1386) that it came into popular use, and it did not form the official name of the Confederation till 1803. This is in itself a proof of the great renown which the League won by its victory at Morgarten. Another is that as years go by we find other members admitted to the privileges of the original alliance of the three Forest districts. First to join the League (1332) was the neighbouring town of Lucerne, which had grown up round the monastery of St Leodegar (whence the place took its name), perhaps a colony, certainly a cell of the great house of Murbach in Alsace, under the rule of which the town remained till its sale in 1291 to the Hapsburgs. This act of Lucerne was opposed by the house of Austria, but, despite the decision of certain chosen arbitrators in favour of the Hapsburg claims, the town clung to the League with which it was connected by its natural position, and thus brought a new element into the pastoral association of the Forest districts, which now surrounded the entire Lake of Lucerne. Next, in 1351, came the ancient city of Zurich, which in 1218, on the extinction of the house of Zaringen, had become a free imperial city in which the abbess of the Fraumunster (the lady of Uri) had great influence, though from 1240 the citizens elected the council which she had previously named. In 1336 there had been a great civic revolution, headed by Rudolph Brun, which had raised the members of the craft guilds to a position in the municipal government of equal power with that of the patricians, who, however, did not cease intriguing to regain their lost privileges, so that Brun, after long hesitation, decided to throw in the lot of the city with the League rather than with Austria. In this way the League now advanced from the hilly country to the plains, though the terms of the treaty with Zurich did not bind it so closely to the Confederates as in the other cases (the right of making alliances apart from the League being reserved, though the League was to rank before these), and hence rendered it possible for Zurich now and again to incline towards Austria in a fashion which did great hurt to its allies. In 1352 the League was enlarged by the admission of Glarus and Zug. Glarus belonged to the monastery of Sackingen on the Rhine (founded by the Irish monk Fridolin), of which the Hapsburgs were "advocates," claiming therefore many rights over the valley, which refused to admit them, and joyfully received the Confederates who came to its aid, but it was placed on a lower footing than the other members of the League, being bound to obey their orders. Three weeks later the town and district of Zug, attacked by the League and abandoned by their Hapsburg masters, joined the Confederation, forming a transition link between the civic and rural members of the League. The immediate occasion of the union of these two districts was the war begun by the

Austrian duke against Zurich, which was ended by the Brandenburg peace of 1352, by which Glarus and Zug were to be restored to the Hapsburgs, who also regained their rights over Lucerne; Zug was won for good by a bold stroke of the men of Schwyz in 1364, but it was not till the day of Nafels (1388) that Glarus recovered its lost freedom. These temporary losses and the treaty made by Brun of Zurich with Austria in 1356 were, however, far outweighed by the entrance into the League in 1353 of the famous town of Bern, which, founded in 1191 by Berthold V. of Zaringen, and endowed with great privileges, had become a free imperial city in 1218 on the extinction of the Zaringen dynasty. Founded for the purpose of bridling the turbulent feudal nobles around, many of whom had become citizens, Bern beat them back at Dornbuhl (1298), and made a treaty with the Forest districts as early as 1323. In 1339, at the bloody fight of Laupen, she had broken the power of the nobles for ever, and in 1352 had been forced by a treaty with Austria to take part in the war against Zurich, but soon after the conclusion of peace entered the League as the ally of the three Forest districts, being thus only indirectly joined to Lucerne and Zurich. The special importance of the accession of Bern was that the League now began to spread to the west, and was thus brought into connexion for the first time with the French speaking land of Savoy. The League thus numbered eight members, the fruits of Morgarten, and no further members were admitted till 1481, after the Burgundian war. But, in order to thoroughly understand the nature of the League, it must be remembered that, while each of the five new members was allied with the original nucleus,—the three Forest districts,—these five were not directly allied to one another. Lucerne was allied with Zurich and Zug; Zurich with Lucerne, Zug, and Glarus; Glarus with Zurich; Zug with Lucerne and Zurich; Bern with no one except the three original members. The circumstances under which each entered the League can alone explain the very intricate relations at this time of its eight members.

Sempach

After a short interval of peace the quarrels with Austria broke out afresh; all the members of the League, save the three Forest districts and Glarus, joined the great union of the South German cities, but their attention was soon called to events nearer home. Lucerne fretted much under the Austrian rule, received many Austrian subjects among her citizens, and refused to pay custom duties to the Austrian bailiff at Rothenburg, on the ground that she had the right of free traffic. An attack on the custom-house at Rothenburg, and the gift of the privileges of burghership to the discontented inhabitants of the little town of Sempach a short way off, so irritated Leopold III. (who then held all the possessions of his house outside Austria) that, unmindful of the defeat of his uncle at Morgarten in 1315, he collected a great army, with the intention of crushing his rebellious town. Lucerne meanwhile had summoned the other members of the League to her aid, and, though Leopold's feint of attacking Zurich caused the troops of the League to march at first in that direction, they discovered their mistake in time to turn back and check his advance on Lucerne. From 1500 to 1600 men of Uri, Schwyz, Unterwalden, and Lucerne opposed the 6000 which made up the Austrian army. The decisive fight took place on July 9, 1386, near Sempach, on a bit of sloping meadow-land, cut up by streams and hedges, which forced the Austrian knights to dismount. The great heat of the day, which rendered it impossible to fight in armour, and the furious attacks of the Confederates, finally broke the Austrian line after more than one repulse and turned the day (see WINKELRIED). Leopold, with a large number of his followers, was slain, and the Hapsburg power within the borders of the Confederation finally broken. Glarus at once rose in arms against Austria, but it was not till the expiration of the truce made after Sempach that Leopold's brother, Albert of Austria, brought an army against Glarus, and was signally defeated at Nafels (not far from Glarus) on April 9, 1388, by a handful of Glarus and Schwyz men, the troops of the other Confederates arriving too late.

Freedom from the political claims of the Hapsburgs

In 1389 a peace for seven years was made, the Confederates being secured in all their conquests; an attempt made in 1393 by Austria by means of Schono, the chief magistrate of Zurich and leader of the patrician party, to stir up a fresh attack failed owing to a rising of the burghers, who sympathized with the Confederates, and on July 16, 1394, the peace was prolonged for twenty years (and again in 1412 for fifty years), various stipulations being made by which the hundred years' struggle of the League to throw off all political dependence on the Hapsburgs was finally crowned with success. Glarus was freed on payment of 200 pounds annually (in 1389–1395 it bought up all the rights of Sackingen), Zug too was released from Austrian rule. Schwyz was given the town of Einsiedeln (the "advocatia" of the great abbey following in 1397); Lucerne got the Entlibuch, Sempach, and Rothenburg, the last-named being mortgaged only; Bern and Solothurn were confirmed in their conquests. Above all, the Confederation as a whole was relieved from the overlordship of the Hapsburgs, to whom, however, all their rights and dues as landed proprietors were expressly reserved,—Bern, Zurich, and Solothurn guaranteeing the maintenance of these rights and dues, with power in case of need to call on the other Confederates to support them by arms. Thus the distinction always made by the Confederates between the Hapsburgs as rulers and as landowners was once more upheld; and, though that powerful family entertained hopes of recovering its former rights, so that technically the treaties of 1389, 1394, and 1412 were but truces, it finally and for ever renounced all its feudal rights and privileges within the Confederation by the "Everlasting Compact" of 1474.

It is probable that Bern did not take any active share in the Sempach war because she was bound by the treaty of peace made with the Austrians in 1368; and Solothurn, allied with Bern, was doubtless a party to the treaty of 1394 (though not yet in the League), because of its sufferings in 1382 at the hands of the Kyburg line of the Hapsburgs, whose possessions (Thun, Burgdorf, &c.) in 1384 fell into the hands of the two allies.

We may mention here the foray (known as the English or Gugler war) made in 1374–75 by Enguerrand de Coucy (husband of Isabella, daughter of Edward III. of England) and his freebooters (many of them Englishmen and Welshmen), called "Gugler" from their pointed steel caps, with the object of obtaining possession of certain towns in the Aargau (including Sempach), which he claimed as the dowry of his mother Catherine, daughter of the Leopold who was defeated at Morgarten. He was put to rout in the Entlibuch by the men of Bern, Freiburg, Schwyz, and Unterwalden in December 1375. This victory, which gave rise to the first great Swiss war song, was commemorated with great rejoicings as lately as 1875.

Struggles in Appenzell, St Gall, and Valais.

III. The great victory at Sempach not merely vastly increased the fame of the Everlasting League but also enabled it to extend both its influence and its territory. The 15th century is the period when both the League and its several members took the aggressive, and the expansion of their power and lands cannot be better seen than by comparing the state of things at the beginning and at the end of this century. The pastoral highlands of Appenzell (Abbatis Cella) and the town of St Gall had

long been trying to throw off the rights exercised over them by the great abbey of St Gall, founded in the 7th century by the Irish monk of that name. The Appenzellers in particular had offered a stubborn resistance, and the abbot's troops had been beaten back by them in 1403 on the heights of Vogelinseck, and again in 1405 in the great fight on the pass of the Stoss[1] (which led up into the highlands), in which the abbot was backed by the duke of Austria. Schwyz had given them some help, and in 1411 Appenzell was placed under the protection of the League (save Bern), with which in the next year the city of St Gall made a similar treaty to last ten years. So too in 1416–17 several of the "tithings" of the Upper Wallis or Valais (*i.e.*, the upper stretch of the Rhone valley), which in 1388 had beaten the bishop and the nobles in a great fight at Visp, became closely associated with Lucerne, Uri, and Unterwalden. It required aid in its final struggle against the great house of Raron, the count-bishop of Sitten (or Sion), and the house of Savoy, which held Lower Wallis,—the Forest districts, on the other hand, wishing to secure themselves against Raron and Savoy in their attempt to permanently conquer the Val d'Ossola on the south side of the Simplon pass. Bern, however, supported its burgher, the lord of Raron, but, by a peace made in 1420, the powers of the bishop and the lord of Raron were greatly diminished, the latter house soon after sold all its lands and rights, and migrated to the district of Toggenburg. Such were the first links which bound these lands with the League, but they did not become full members for a long time—Appenzell in 1513, St Gall in 1803, Wallis in 1815.

Space will not allow us to enumerate all the small conquests made in the first half of the 15th century by every member of the League; suffice it to say that each increased and rounded off its territory, but did not give the conquered lands any political rights, governing them as "subject lands," often very harshly. The same phenomenon of lands which had won their own freedom playing the part of tyrant over other lands which joined them more or less by their voluntary action is seen on a larger scale in the case of the conquest of the Aargau, and in the first attempts to secure a footing south of the Alps.

In 1412 the treaty of 1394 between the League and the Hapsburgs had been renewed for fifty years; but when in 1415 Duke Frederick of Austria helped Pope John XXIII. to escape from Constance, where the great council was then sitting, and the emperor Sigismund placed the duke under the ban of the empire, summoning all members of the empire to arm against him, the League hesitated, because of their treaty of 1412, till the emperor declared that all the rights and lands of Austria in the League were forfeited, and that their compact did not release them from their obligations to the empire. In the name, therefore, of the emperor, and by his special command, the different members of the League overran the extensive Hapsburg possessions in the Aargau. The chief share fell to Bern, but certain districts (known as the *Freie Aemter*) were joined together and governed as bailiwicks held in common by all the members of the League (save Uri, busied in the south, and Bern, who had already secured the lion's share of the spoil for herself). This is the first case in which the League as a whole took up the position of rulers over districts which, though guaranteed in the enjoyment of their old rights, were nevertheless politically unfree. As an encouragement and a reward, Sigismund had granted in advance to the League the right of criminal jurisdiction ("haute justice" or "Blutbann"), which points to the fact that they were soon to become independent of the empire, as they were of Austria. But all through the 15th century it must be carefully borne in mind that the members of the League were constantly recognized as and acknowledged themselves to be members of the empire.

First Italian conquests.

As the natural policy of Bern was to seek to enlarge its borders at the expense of Austria, and later of Savoy, so we find that Uri, shut off by physical causes from extension in other directions, as steadily turned its eyes towards the south. In 1410 the valley of Urseren was finally joined to Uri, though communications were difficult, and carried on only by means of the "stiebende Brucke," a wooden bridge suspended by chains over the Reuss, along the side of a great rocky buttress (pierced in 1707 by the tunnel known as the Urnerloch), yet this enlargement of the territory of Uri gave it complete command over the St Gotthard pass, long commercially important, and now to serve for purposes of war and conquest. Already in 1403 Uri and Obwald had taken advantage of a quarrel with the duke of Milan as to custom dues at the market of Varese to occupy the long narrow valley on the south of the pass called the Val Leventina; in 1410 the men of the same two lands, exasperated by the insults of the local lords, called on the other members of the League, and all jointly (except Bern) occupied the Val d'Ossola, on the south side of the Simplon pass. But in 1414 they lost this to Savoy, and, with the object of getting it back, obtained in 1416–17 the alliance of the men of Upper Wallis, then fighting for freedom, and thus regained the valley, despite the exertions of the great Milanese general Carmagnola. In 1419 Uri and Obwald bought from its lord the town and district of Bellinzona. This rapid advance, however, did not approve itself to the duke of Milan, and Carmagnola reoccupied both valleys; the Confederates were not at one with regard to these southern conquests; a small body pressed on in front of the rest, but was cut to pieces at Arbedo near Bellinzona in 1422. A bold attempt in 1425 by a Schwyzer, Peter Rissi by name, to recover the Val d'Ossola caused the Confederates to send a force to rescue these adventurers; but the duke of Milan intrigued with the divided Confederates, and finally in 1426, by a payment of a large sum of money and the grant of certain commercial privileges, the Val Leventina, the Val d'Ossola, and Bellinzona were restored to him. Thus the first attempt of Uri to acquire a footing south of the Alps had failed, but the wish to recover its lost conquests still continued, and a later attempt was more successful, leading to the inclusion in the Confederation of what has been called "Italian Switzerland."

The first civil war.

The original contrasts between the social condition of the different members of the League became more marked when the period of conquest began, and led to quarrels and ill feeling in the matter of the Aargau and the Italian conquests which a few years later ripened into a civil war, brought about by the dispute as to the succession to the lands of Frederick, count of Toggenburg, the last male representative of his house. Count Frederick's predecessors had greatly extended their domains, so that they took in not only the Toggenburg or upper valley of the Thur, but Uznach, Sargans, the Rhine valley between Feldkirch and Sargans, the Prättigau, and the Davos valley. He himself, the last great feudal lord on the left bank of the Rhine, had managed to secure his vast possessions by making treaties with several members of the League, particularly Zurich (1402) and Schwyz (1417),—from 1428 inclining more and more to Schwyz (then ruled by Ital Reding), being disgusted with the arrogant behaviour of Stussi, the burgomaster of Zurich. His

[1] The tales of the heroic defence of Uli Rottach of Appenzell, and of the appearance of a company of Appenzell women disguised as warriors which turned the battle, are told in connexion with this fight, but do not appear till the 17th and 18th centuries, being thus quite unhistorical, so far as our genuine evidence goes.

death (April 30, 1436) was the signal for the breaking out of strife The Prattigau and Davos valley formed the League of the Ten Jurisdictions in Rhætia (see below), while Frederick's widow sided with Zurich against Schwyz for different portions of the great inheritance which had been promised them After being twice defeated, Zurich was forced in 1440 to buy peace by certain cessions (the Upper March) to Schwyz, the general feeling of the Confederates being opposed to Zurich, several of them going so far as to send men and arms to Schwyz Zurich, however, was bitterly disappointed at these defeats, and had recourse to that policy which she had adopted in 1356 and 1393—an alliance with Austria (concluded in 1442), which now held the imperial throne in the person of Frederick III Though technically within her rights according to the terms on which she had joined the League in 1351, this act of Zurich caused the greatest irritation in the Confederation, and civil war at once broke out, especially when the Hapsburg emperor had been solemnly received and acknowledged in Zurich In 1443 the Zurich troops were completely defeated at St Jakob on the Sihl, close under the walls of the city, Stussi himself being slain Next year the city itself was long besieged Frederick, unable to get help elsewhere, procured from Charles VII of France the despatch of a body of Armagnac free lances (the Écorcheurs), who came, 30,000 strong, under the dauphin Louis, plundering and harrying the land, till, at the very gates of the free imperial city of Basel (which had made a twenty years' alliance with Bern), by the leper house of St Jakob on the Birs (August 26, 1444), the desperate resistance of a small body of Confederates (1200 to 1500) till cut to pieces, checked the advance of the freebooters, who sustained such tremendous losses that, though the victors, they hastily made peace, and returned whence they had come Several small engagements ensued, Zurich long declining to make peace because the Confederates required, as the result of a solemn arbitration, the abandonment of the Austrian alliance At length it was concluded in 1450, the Confederates restoring almost all the lands they had won from Zurich Thus ended the third attempt of Austria to conquer the League by means of Zurich, which used its position as an imperial free city greatly to the harm of the League, and was the cause of the first civil war which distracted the League

onsti ution f the eague, . 1450

These fresh proofs of the valour of the Confederates, and of the growing importance of the League, did not fail to produce important results In 1452 the "Confederates of the Old League of Upper Germany" (as they styled themselves) made their first treaty of alliance with France, a connexion which was destined to exercise so much influence on their history Round the League there began to gather a new class of allies (known as "Zugewandte Orte," or associated districts), more closely joined to it, or to certain members of it, than by a mere treaty of friendship, yet not being admitted to the rank of a full member of the League Of these associates three, the abbot (1451) and town of St Gall (1454), and the town of Bienne (Biel), through its alliance (1352) with Bern, were given seats and votes in the diet, being called "socii", while others, known as "confœderati," were not so closely bound to the League, such as Wallis (1416–17), Schaffhausen (1454), Muhlhausen (1466), Rothweil (1463)[1] Appenzell, too, in 1452, rose from the rank of a "protected district" into the class of associates, outside which were certain places "protected" by several members of the League, such as Gersau (1359), the abbeys of Engelberg (*c.* 1421) and Einsiedeln (1397–1434), and the town of Rapperschwyl (1458) The relation of the "associates" to the League may be compared with the ancient practice of "commendation" they were bound to obey orders in the matter of declaring war, making alliances, &c

In 1439 Sigismund succeeded his father Frederick in the Hapsburg lands in Alsace, the Thurgau, and Tyrol, and, being much irritated by the constant encroachments of the Confederates, in particular by the loss of Rapperschwyl (1458), declared war against them, but fared very badly In 1460 the Confederates overran the Thurgau, and occupied Sargans Winterthur was only saved by an heroic defence Hence in 1461 Sigismund had to give up his claims on those lands and renew the peace for fifteen years, while in 1467 he sold Winterthur to Zurich Thus the whole line of the Rhine was lost to the Hapsburgs, who retained (till 1802) in the territories of the Confederates the Frickthal only The Thurgovian bailiwicks were governed in common as "subject" lands by all the Confederates except Bern The touchiness of the now rapidly advancing League was shown by the eagerness with which in 1468 its members took up arms against certain small feudal nobles who were carrying on a harassing guerilla warfare with their allies Schaffhausen and Muhlhausen They laid siege to Waldshut, and to buy them off Sigismund in August 1468 engaged to pay 10,000 gulden as damages by June 24, 1469, in default of payment the Confederates were to keep for ever the Black Forest, Waldshut, and certain other Black Forest towns on the Rhine A short time before (1467) the League had made treaties of friendship with Philip the Good, duke of Burgundy, and with the duke of Milan All was now prepared for the intricate series of intrigues which led up to the Burgundian War,—a great epoch in the history of the League, as it created a common national feeling, enormously raised its military reputation, and brought about the close connexion with certain parts of Savoy which finally (1803–15) were admitted into the League

Sigismund did not know where to obtain the sum he had promised to pay In this strait he turned to Charles the Bold (properly the Rash), duke of Burgundy, who was then beginning his wonderful career, and aiming at restoring the kingdom of Burgundy For this purpose Charles wished to marry his daughter and heiress to Maximilian, son of the emperor, and first cousin of Sigismund, in order that the emperor might be induced to give him the Burgundian crown Hence he was ready to meet Sigismund's advances On May 9, 1469, Charles promised to give Sigismund 50,000 florins, receiving as security for repayment Alsace, the Breisgau, the Sundgau, the Black Forest, and the four Forest towns on the Rhine (Rheinfelden, Sackingen, Lauffenburg, and Waldshut); in addition, Charles took Sigismund under his protection, specially against the Swiss, and agreed to give him aid in a war if he was attacked by them. It was not unnatural for Sigismund to think of attacking the League, but Charles's engagement to him is quite inconsistent with the friendly agreement made between Burgundy and the League as late as 1467. The emperor then on his side annulled Sigismund's treaty of 1468 with the Swiss, and placed them under the ban of the empire Charles committed the mortgaged lands to Peter von Hagenbach, who proceeded to try to establish his master's power there by such harsh and severe measures as to cause all the people to murmur, then rise against him

The Bur-gundian War.

The Swiss in these circumstances began to look towards Louis XI of France, who had confirmed the treaty of friendship made with them by his father in 1452. Sigismund had applied to him early in 1469 to help him in his many troubles, and to give him aid against the Swiss, but Louis had point-blank refused. Anxious to secure

[1] To the class of "confœderati" belonged in later times Neuchâtel (1495–98), the Leagues of Rhætia (1497–98), Geneva (1519–36), and the bishop of Basel (1579)

their neutrality in case of his war with Charles, he made a treaty with them on August 13, 1470, to this effect. All the evidence goes to show that Sigismund was not a tool in the hands of Louis, and that Louis, at least at that time, had no definite intention of involving Charles and the Swiss in a war, but wished only to secure his own flank.

Sigismund in the next few years tried hard to get from Charles the promised aid against the Swiss (the money was paid punctually enough by Charles on his behalf), who put him off with various excuses. Charles on his side, in 1471–72, tried to make an alliance with the Swiss, his efforts being supported by a party in Bern headed by Adrian von Bubenberg. Probably Charles wished to use both Sigismund and the Swiss to further his own interests, but his shifty policy had the effect of alienating both from him. Sigismund, disgusted with Charles, now inclined towards Louis, whose ally he formally became in the summer of 1473,—a change which was the real cause of the emperor's flight from Treves in November 1473, when he had come there expressly to crown Charles. The Confederates on their side were greatly moved by the oppression of their friends and allies in Alsace by Hagenbach, and tried in vain (January 1474) to obtain some redress from his master. Charles's too astute policy had thus lost him both Sigismund and the Swiss. They now looked upon Louis, who, thoroughly aware of Charles's ambition, and fearing that his disappointment at Treves would soon lead to open war, aimed at a master stroke—no less than the reconciliation of Sigismund and the Swiss. This on the face of it seemed impracticable, but common need and Louis's dexterous management brought it to pass, so that on March 30, 1474, the Everlasting Compact was signed at Constance, by which Sigismund finally renounced all Austrian claims on the lands of the Confederates, and guaranteed them in quiet enjoyment of them; they, on the other hand, agreed to support him if Charles did not give up the mortgaged lands when the money was paid down. The next day the Swiss joined the league of the Alsatian and Rhine cities, as also did Sigismund. Charles was called on to receive the money contributed by the Alsatian cities, and to restore his lands to Sigismund. He, however, took no steps. Within a week the oppressive bailiff Hagenbach was captured, and a month later (May 9, 1474) he was put to death, Bern alone of the Confederates being represented. On October 9 the emperor, acting of course at the instance of Sigismund, ordered them to declare war against Charles, which took place on October 25, Bern acting in the name of the Confederates, and alleging that they made war solely by order of the emperor and not as principals. Next day Louis formally ratified his alliance with the Confederates, promising money and pensions, the latter to be increased if he did not send men. Throughout these negotiations and later, Bern directs Swiss policy, though all the Confederates are not quite agreed. She was specially exposed to attack from Charles and Charles's ally (since 1468) Savoy, and her best chance of extending her territory lay towards the west and south. A forward policy was thus distinctly the best for Bern, and this was the line supported by the French party under Nicholas von Diesbach, Von Bubenberg opposing it, though not with any idea of handing over Bern to Charles. The Forest districts, however, were very suspicious of this movement to the west, by which Bern alone could profit, though the League as a whole might lose; then, too, Uri had in 1440 finally won the Val Leventina, and she and her neighbours favoured a southerly policy—a policy which was crowned with success after the gallant victory won at Giornico in 1478 by a handful of men from Zurich, Lucerne, Uri, and Schwyz over 12,000 Milanese troops, though the main body of the Confederates was already on its way home. Thus Uri gained for the first time a permanent footing south of the Alps, not long before Bern had won its first conquests from Savoy.

The war in the west was begun by Bern and her allies (Freiburg, Solothurn, &c.) by marauding expeditions across the Jura, in which Hericourt (November 1474) and Blamont (August 1475) were taken, both towns being held of Charles by the "sires" de Neuchâtel, a cadet line of the counts of Montbéliard. It is said that in the former expedition the white cross was borne (for the first time) as the ensign of the Confederates, but not in the other. Meanwhile Yolande, the duchess of Savoy, had, through fear of her brother Louis XI. and hatred of Bern, finally joined Charles and Milan (January 1475), the immediate result of which was the capture, by the Bernese and friends (on the way back from a foray on Pontarlier in the Free County of Burgundy or Franche Comté) of several places in Vaud, notably Granson and Échallens, both held of Savoy by a member of the house of Challon, princes of Orange (April 1475), as well as Orbe and Jougne, held by the same, but under Burgundy. In the summer Bern seized on the Savoyard district of Aigle. Soon after (October–November 1475) the same energetic policy won for her the Savoyard towns of Morat, Avenches, Estavayer, and Yverdun, while (September) the Upper Wallis, which had conquered all Lower or Savoyard Wallis, entered into alliance with Bern for the purpose of opposing Savoy by preventing the arrival of Milanese troops. Alarmed at their success, the emperor and Louis deserted (June–September) the Confederates, who thus, by the influence of Louis and Bernese ambition, saw themselves led on and then abandoned to the wrath of Charles, and very likely to lose their new conquests. They had entered on the war as "helpers" of the emperors, and now became principals in the war against Charles, who raised the siege of Neuss, made an alliance with Edward IV. of England, received the surrender of Lorraine, and hastened across the Jura (February 1476) to the aid of his ally Yolande. On February 21 Charles laid siege to Granson, and after a week's siege the garrison of Bernese and Freiburgers had to surrender, and, by way of retaliation for the massacre of the garrison of Estavayer in 1475, of the 412 men two only were spared in order to act as executioners of their comrades. This hideous news met a large body of the Confederates gathered together in great haste to relieve the garrison, and going to their rendezvous at Neuchâtel, where both the count and town had become allies of Bern in 1406. An advance body of Bernese, Freiburgers, and Schwyzers, in order to avoid the castle of Vauxmarcus (seized by Charles), by the Lake of Neuchâtel, on the direct road from Neuchâtel to Granson, climbed over a wooded spur to the north, and attacked (March 2) the Burgundian outposts. Charles drew back his force in order to bring down the Swiss to the more level ground where his cavalry could act, but his rear misinterpreted the order, and when the main Swiss force appeared over the spur the Burgundian army was seized with a panic and fled in disorder. The Swiss had gained a glorious victory, and regained their conquest of Granson, besides capturing very rich spoil in Charles's camp, parts of which are preserved to the present day in various Swiss armouries. Such was the famous battle of Granson. Charles at once retired to Lausanne, and set about reorganizing his army. He resolved to advance on Bern by way of Morat (or Murten), which was occupied by a Bernese garrison under Von Bubenberg, and laid siege to it on June 9. The Confederates had now put away all jealousy of Bern, and collected a large army. The decisive battle took place on the afternoon of June

22, after the arrival of the Zurich contingent under Hans Waldmann English archers were in Charles's army, while with the Swiss was René, the dispossessed duke of Lorraine After facing each other many hours in the driving rain, a body of Swiss, by outflanking Charles's van, stormed his palisaded camp, and the Burgundians were soon hopelessly beaten, the losses on both sides (a contrast to Granson) being exceedingly heavy Vaud was reoccupied by the Swiss, Savoy having overrun it on Charles's advance, but Louis now stepped in and procured the restoration of Vaud to Savoy, save Granson, Morat, Orbe, and Échallens, which were to be held by the Bernese jointly with the Freiburgers, Aigle by Bern alone,—Savoy at the same time renouncing all its claims over Freiburg Thus French-speaking districts first became permanently connected with the Confederation, hitherto purely German, and the war had been one for the maintenance of recent conquests, rather than a purely defensive one against an encroaching neighbour desirous of crushing Swiss freedom Charles tried in vain to raise a third army, René recovered Lorraine, and on January 5, 1477, under the walls of Nancy, Charles's wide-reaching plans were ended by his defeat and death, many Swiss being with René's troops The wish of the Bernese to overrun Franche Comté was opposed by the older members of the Confederation, and finally, in 1479, Louis, by very large payments, secured the abandonment of all claims on that province, which was annexed to the French crown

Internal disputes in the League

These glorious victories really laid the foundation of Swiss nationality, but soon after them the long-standing jealousy between the civic and rural elements in the Confederation nearly broke it up This had always hindered common action save in case of certain pressing questions In 1370, by the "Parsons' ordinance" (Pfaffenbrief), agreed on by all the Confederates except Bern and Glarus, all residents, whether clerics or laymen, in the Confederation who were bound by oath to the duke of Austria were to swear faith to the Confederation, and this oath was to rank before any other, no appeal was to lie to any court spiritual or lay (except in matrimonial and purely spiritual questions) outside the limits of the Confederation, and many regulations were laid down as to the suppression of private wars and keeping of the peace on the high roads Further, in 1393, the "Sempach ordinance" was accepted by all the Confederates and Solothurn, this was an attempt to enforce police regulations and to lay down "articles of war" for the organization and discipline of the army of the Confederates, minute regulations being made against plundering,—women, monasteries, and churches being in particular protected and secured But save these two documents common action was limited to the meeting of two envoys from each member of the Confederation and one from each of the "socii" in the diet, the powers of which were greatly limited by the instructions brought by each envoy, thus entailing frequent reference to his Government, and included foreign relations, war and peace, and common arrangements as to police, pestilence, customs duties, coinage, &c The decisions of the majority did not bind the minority save in the case of the affairs of the bailiwicks ruled in common Thus everything depended on common agreement and goodwill But disputes as to the division of the lands conquered in the Burgundian war, and the proposal to admit into the League the towns of Freiburg and Solothurn, which had rendered such good help in the war, caused the two parties to form separate unions, for by the latter proposal the number of towns would have been made the same as that of the "Lander," which these did not at all approve Suspended a moment by the campaign in the Val Leventina, these quarrels broke out after the victory of Giornico, and at the diet of Stanz (December 1481), when it seemed probable that the failure of all attempts to come to an understanding would result in the disruption of the League, the mediation of Nicholas von der Flue (or Bruder Klaus), a holy hermit of Sachseln in Obwald, though he did not appear at the diet in person, succeeded in bringing both sides to reason, and the third great ordinance of the League—the "compact of Stanz"—was agreed on By this the promise of mutual aid and assistance was renewed, especially when one member attacked another, and stress was laid on the duty of the several Governments to maintain the peace, and not to help the subjects of any other member in case of a rising The treasure and movables captured in the war were to be equally divided amongst the combatants, the territories and towns amongst the members of the League As a practical proof of the reconciliation, on the same day the towns of Freiburg and Solothurn were received as full members of the Confederation, united with all the other members, though on less favourable terms than usual, for they were forbidden to make alliances, save with the consent of all or of the greater part of the other members Both towns had long been allied with Bern, whose influence was greatly increased by their admission Freiburg, founded in 1178 by Berthold IV of Zaringen, had on the extinction of that great dynasty (1218) become a free imperial city, but had bowed successively to Kyburg (1249), Austria, the sons of Rudolph (1277), and Savoy (1452), when Savoy gave up its claims in 1477 Freiburg once more became a free imperial city She had become allied with Bern as early as 1213. The ancient Roman city of Solothurn (or Soleure) had been associated with Bern from 1351, but had in vain sought admission into the League in 1411 Both the new members had done much for Bern in the Burgundian war, and it was for their good service that she now procured them this splendid reward, in hopes perhaps of aid on other important and critical occasions.

The compact of Stanz strengthened the bonds which joined the members of the Confederation, and the same centralizing tendency is well seen in the attempt (1483–89) of Hans Waldmann, the burgomaster of Zurich, to assert the rule of his city over the neighbouring country districts, to place all power in the hands of the guilds (whereas by Brun's constitution the patricians had an equal share), to suppress all minor jurisdictions, and to raise a uniform tax But this idea of concentrating all powers in the hands of the Government aroused great resistance, and led to his overthrow and execution Peter Kistler succeeded (1470) better at Bern in a reform on the same lines, but not of such a sweeping character

Practical freedom from the empire

The early history of each member of the Confederation, and of the Confederation itself, shows that they always professed to belong to the empire, trying to become immediately dependent on the emperor in order to prevent the oppression of middle lords, and to enjoy practical liberty The empire itself had now become very much of a shadow; cities and princes were gradually asserting their own independence, sometimes breaking away from it altogether. Now, by the time of the Burgundian war the Confederation stood in a position analogous to that of a powerful free imperial city As long as the emperor's nominal rights were not enforced, all went well, but, when Maximilian, in his attempt to reorganize the empire, erected in 1495 at Worms an imperial chamber which had jurisdiction in all disputes between members of the empire, the Confederates were very unwilling to obey it, partly because they could maintain peace at home by their own authority, and partly because it interfered with their practical independence Again, their refusal to join the

"Swabian League," formed in 1488 by the lords and cities of South Germany to keep the public peace, gave further offence, as well as their fresh alliances with France. Hence a struggle was inevitable, and the occasion by reason of which it broke out was the seizure by the Tyrolese authorities in 1499 of the Munsterthal, which belonged to the "Gotteshausbund," one of the three leagues which had gradually arisen in Rhætia. These were the "Gotteshausbund" in 1367 (taking in all the dependents of the cathedral church at Chur living in the Oberhalbstein and Engadine), the "Oberer or Grauer Bund" in 1395 and 1424 (taking in the abbey of Dissentis and many counts and lords in the Vorder Rhein valley, though its name is not derived, as often stated, from the "grey coats" of the first members, but from "grawen" or "grafen," as so many counts formed part of it), and the "League of the Ten Jurisdictions" (Zehngerichtenbund), which arose in the Prättigau and Davos valley (1436) on the death of Count Frederick of Toggenburg, but which, owing to certain Austrian claims in it, was not quite so free as its neighbours. The first and third of these became allied in 1450, but the formal union of the three dates only from 1524, as documentary proof is wanting of the alleged meeting at Vazerol in 1471, though practically before 1524 they had very much in common. In 1497 the Oberer Bund, in 1498 the Gotteshausbund, made a treaty of alliance with the Everlasting League or Swiss Confederation, the Ten Jurisdictions being unable to do more than show sympathy, owing to Austrian influence, which was not bought up till 1649–52. Hence this attack on the Munsterthal was an attack on an "associate" member of the Swiss Confederation, Maximilian being supported by the Swabian League, but its real historical importance is the influence it had on the relations of the Swiss to the empire. The struggle lasted several months, the chief fight being that "an der Calven" or "auf der Malserheide" (May 22, 1499), in which Benedict Fontana, a leader of the Gotteshausbund men, performed many heroic deeds before his death. But, both sides being exhausted, peace was made at Basel on September 22, 1499. By this the matters in dispute were referred to arbitration, and the emperor annulled all the decisions of the imperial chamber against the Confederation, but nothing was laid down as to its future relations with the empire. No further real attempt, however, was made to enforce the rights of the emperor, and the Confederation became a state allied with the empire, enjoying practical independence, though not formally freed till 1648. Thus, 208 years after the origin of the Confederation, it had got rid of all Austrian claims (1394 and 1474), as well as all practical subjection to the emperor. But its further advance towards the position of an independent state was long checked by religious divisions within, and by the enormous influence of the French king on its foreign relations.

With the object of strengthening the northern border of the Confederation, two more full members were admitted in 1501—Basel and Schaffhausen—on the same terms as Freiburg and Solothurn. The city of Basel had originally been ruled by its bishop, but in the 14th century it became a free imperial city; before 1501 it had made no permanent alliance with the Confederation, though in continual relations with it. Schaffhausen had grown up round the Benedictine monastery of All Saints, and became in the 13th century a free imperial city, but was pledged to Austria from 1330 to 1415, in which last year the emperor Sigismund declared all Duke Frederick's rights forfeited in consequence of his abetting the flight of Pope John XXII. It had become an "associate" of the Confederation in 1454.

The League enlarged to thirteen members.

A few years later, in 1513, Appenzell, which in 1411 had become a "protected" district, and in 1452 an "associate" member of the Confederation, was admitted as the thirteenth full member, and this remained the number till the fall of the old Confederation in 1798. Round the three original members had gathered first five others, united with the three, but not necessarily with each other; and then gradually there grew up an outer circle, consisting of five more, allied with all the eight old members, but tied down by certain stringent conditions. Constance, which seemed called by nature to enter the League, kept aloof, owing to a quarrel as to the criminal jurisdiction in the Thurgau, which had been pledged to it before the district was conquered by the Confederates. Neuchâtel in 1495–98 became permanently allied with several members of the Confederation.

Conquests in Italy.

In the first years of the 16th century the influence of the Confederates south of the Alps was largely extended. The system of giving pensions, in order to secure the right of enlisting men within the Confederation, and of capitulations, by which the different members supplied troops, was originated by Louis XI. in 1474, and later followed by many other princes. Though a tribute to Swiss valour and courage, this practice had very evil results, of which the first fruits were seen in the Milanese (1500–1516). Both Charles VIII. (1484) and Louis XII. (1499 for ten years) renewed Louis XI.'s treaty. The French attempts to gain Milan were largely carried on by the help of Swiss mercenaries, some of whom were on the opposite side; and, as brotherly feeling was still too strong to make it possible for them to fight against one another, Ludovico Sforza's Swiss troops shamefully betrayed him to the French at Novara (1500). In 1500, too, the three Forest districts occupied Bellinzona at the request of its inhabitants, and in 1503 Louis XII. was forced to cede it to them. He, however, often held back the pay of his Swiss troops, and treated them as mere hirelings, so that when the ten years' treaty came to an end Matthew Schinner, bishop of Sitten (or Sion), induced them to join (1510) the pope, Julius II., then engaged in forming the Holy League to expel the French from Italy. But when, after the battle of Ravenna, Louis XII. became all-powerful in Lombardy, 20,000 Swiss poured down into the Milanese and occupied it, Schmid, the burgomaster of Zurich, naming Maximilian (Ludovico's son) duke of Milan, in return for which he ceded to the Confederates Locarno, Val Maggia, Mendrisio, and Lugano (1512), while the Rhætian leagues received Chiavenna, Bormio, and the Valtelline. (The former districts, with Bellinzona and the Val Leventina, were in 1803 made into the canton of Ticino; the latter were held by Rhætia till 1797.) In 1513 the Swiss completely defeated the French at Novara, and in 1514 Pace was sent by Henry VIII. of England to give pensions and get soldiers. Francis I. at once on his accession (1515) began to prepare to win back the Milanese, and, successfully evading the Swiss awaiting his descent from the Alps, beat them in a pitched battle at Marignano near Milan (September 13, 1515), which broke the Swiss power in North Italy, so that in 1516 a peace was made with France,—Wallis, the Rhætian leagues, and St Gall being included on the side of the Confederates. Provisions were made for the neutrality of either party in case the other became involved in war, and large pensions were promised. This treaty was extended by another in 1521 (to which Zurich, then under Zwingli's influence, would not agree, holding aloof from the French alliance till 1614), by which the French king might, with the consent of the Confederation, enlist any number of men between 6000 and 16,000, paying them fit wages, and the pensions were raised to 3000 francs annually to each member of the Confederation. These two treaties were

the starting point and foundation of later French interference with Swiss affairs, which became more and more oppressive, and was not finally thrown off till 1814

The Reformation

IV In 1499 the Swiss had practically renounced their allegiance to the emperor, the temporal chief of the world according to mediæval theory, and in the 16th century a great number of them did the same by the world's spiritual chief, the pope The scene of the revolt was Zurich, and the leader Ulrich Zwingli But we cannot understand Zwingli's career unless we remember that he was almost more a political reformer than a religious one In his former character his policy was threefold He bitterly opposed the French alliance and the pension and mercenary system, for he had seen its evils with his own eyes when serving as chaplain with the troops in the Milanese in 1512 and 1515 Hence in 1521 his influence kept Zurich back from joining in the treaty with Francis I Then, too, at the time of the Peasant Revolt (1525), he did what he could to lighten the harsh rule of the city over the neighbouring rural districts, and succeeded in getting serfage abolished Again he had it greatly at heart to secure for Zurich and Bern the chief power in the Confederation, because of their importance and size, he wished to give them extra votes in the diet, and would have given them two thirds of the "common bailiwicks" when these were divided In his character as a religious reformer we must remember that he was a humanist, and deeply read in classical literature, which accounts for his turning the canonries of the Grossmunster into professorships, reviving the old school of the Carolinum, and relying on the arm of the state to carry out religious changes His theology sprang from a single ruling principle—the absolute and unlimited sovereignty of God Hence his profound respect for the letter of the Bible led him to "legalism" and extreme Sabbatarianism Hence his view of the incarnation bordered on Unitarianism, and sacraments were mere signs of that which is already given, hence too sprang his denial of man's free will and his belief in absolute election and reprobation Nay, God, being the absolute Author of all things, is the Author of evil, though He is not immoral, for He is above law, and what is morally wrong for man is not so for God Zwingli began to preach the new views as early as 1516, long before and quite independently of Luther, but it was only when at the end of 1518 he was called to Zurich as parish priest that he began to make any noise, and in fact it was even later (1522), when his admirers allowed themselves to eat fish in Lent, that disturbances arose, and the diet forbade all preaching which would disturb the public peace But, after succeeding at two public disputations, his views rapidly gained ground at Zurich, which long, however, stood quite alone, the other Confederates issuing an appeal to await the decision of the asked-for general council, and proposing to carry out by the arm of the state certain small reforms, while clinging to the old doctrines Zwingli had to put down the extreme wing of the Reformers—the Anabaptists—by force Quarrels too arose as to allowing the new views in the "common bailiwicks" The disputation at Baden (1526) was in favour of the maintainers of the old faith, but that at Bern (1528) resulted in securing for the new views the support of that great town, and so matters began to take another aspect In 1528 Bern joined the union formed in 1527 in favour of religious freedom by Zurich and Constance (*Christliches Burgrecht*), and her example was followed by Schaffhausen, St Gall, Basel, and Muhlhausen This attempt to virtually break up the League was met in February 1529 by the offensive and defensive alliance made with King Ferdinand of Hungary (brother of the emperor) by the three Forest districts, with Lucerne and Zug, followed (April 1529) by the "Christliche Vereinigung," or union between these five members of the League Zurich was greatly moved by this, and, as Zwingli held that for the honour of God war was as necessary as iconoclasm, war seemed imminent, but Bern held back, and the first peace of Kappel was concluded (June 1529), by which the Hungarian alliance was annulled and the principle of "religious parity" (or freedom) was admitted in the case of each member of the League and in the "common bailiwicks" This was at once a victory and a check for Zwingli He tried to make an alliance with the Protestants in Germany, but failed at the meeting at Marburg (October 1529) to come to an agreement with Luther on the subject of the eucharist, and the division between the Swiss and the German Reformations was stereotyped Zwingli now developed his views as to the greater weight which Zurich and Bern ought to have in the League Quarrels too went on in the "common bailiwicks," for the members of the League who clung to the old faith had a majority of votes in matters relating to these districts Zurich tried to cut off supplies of food from reaching the Catholic members (contrary to the wishes of Zwingli), and, on the death of the abbot of St Gall, disregarding the rights of Lucerne, Schwyz, and Glarus, who shared with her the office of protectors of the abbey, suppressed the monastery, giving the rule of the land and the people to her own officers Bern in vain tried to moderate this aggressive policy, and the Catholic members of the League indignantly advanced towards Zurich Near Kappel, on October 11, 1531, the Zurich vanguard under Goldli was (perhaps owing to his treachery) surprised, and despite reinforcements the men of Zurich were beaten, among the slain being Zwingli himself Another defeat completed the discomfiture of Zurich, and by the second peace of Kappel (November 1531) the principle of "parity" was recognized, not merely in the case of each member of the League and the "common bailiwicks," *but also in that of each parish or "commune"* Thus everywhere the rights of a minority were protected from the encroachments of the majority The "Christliches Burgrecht" was abolished, and Zurich condemned to pay heavy damages Bullinger succeeded Zwingli, but this treaty meant that neither side could now try to convert the other wholesale The League was permanently split into two religious camps the Catholics, who met at Lucerne, numbered, besides the five already mentioned, Freiburg, Solothurn, Appenzell (Inner Rhoden), and St Gall (with Wallis), thus commanding seventeen votes (out of twenty-nine) in the diet, the Evangelicals were Zurich, Bern, Basel, Schaffhausen, Appenzell (Ausser Rhoden) (with Graubunden), who met at Aarau, while Thurgau and Glarus were divided

Conquest of Vaud by Bern.

Bern had her eyes always fixed upon the Savoyard lands to the south-west, in which she had got a footing in 1475, and now made zeal for religious reforms the excuse for resuming her advance policy In 1526 William Farel, a preacher from Dauphiné, had been sent to reform Aigle, Morat, and Neuchâtel In 1532 he came to Geneva, an ancient city of which the rule had long been disputed by the prince-bishop, the burgesses, and the house of Savoy, the latter holding the neighbouring districts She had become in 1519 the ally of Freiburg, in 1526 that of Bern also, and in 1530, by their influence, a peace was made between the contending parties (In 1531 Bonivard, the prior of St Victor, for joining a rising in favour of political liberty, was imprisoned in the castle of Chillon, remaining there till 1536) The religious changes introduced by Farel greatly displeased Freiburg, which abandoned the alliance (1534), and in 1535 the Reformation was firmly planted in the city The duke of

Savoy, however, took up arms against Bern (1536), who overran Gex, Vaud, and the independent bishopric of Lausanne, as well as the Chablais to the south of the lake Geneva was only saved by the unwillingness of the citizens Bern thus ruled north and south of the lake, and carried matters with a high hand Shortly after this John Calvin, a refugee from Picardy, was, when passing through Geneva, detained by Farel to aid him, and, after an exile from 1538–1541, owing to opposition of the papal party, and of the burghers, who objected to Bernese rule, he set up his wonderful theocratic government in the city, pushing Zwingli's principles to their ultimate conclusions (see SERVETUS) (1553), and in 1555 expelling many who upheld municipal liberty, replacing them by French, English, Italians, and Spaniards as new burghers, whose names are still frequent in Geneva (*e g*, Candolle, Mallet, Diodati) His theological views led to disputes with the Zurich Reformers, which were partly settled by the *Consensus Tigurinus* of 1549, and more completely by the *Helvetic Confession* of 1566, which formed the basis of union between the two parties

By the time of Calvin's death (1564) the old faith had begun to take the offensive, the reforms made by the council of Trent urged on the Catholics to make an attempt to recover lost ground Emmanuel Philibert, duke of Savoy, the hero of St Quentin (1557), and one of the greatest generals of the day, with the support of the Catholic members of the League, demanded the restoration of the districts seized by Bern in 1536, and on October 30, 1564, the treaty of Lausanne confirmed the decision of the other Confederates sitting as arbitrators (according to the old constitutional custom) By this treaty Gex, the Genevois, and the Chablais were to be given back, while Vevey, Chillon, Lausanne, Yverdun were to be kept by Bern, who engaged to maintain the old rights and liberties of Vaud, which in 1565 were further placed under the special protection of France Thus Bern lost the lands south of the lake, in which St Francis of Sales, the exiled prince-bishop of Geneva, at once proceeded to carry out the restoration of the old faith In 1555 Bern and Freiburg, as creditors of the debt-laden count, divided the county of Gruyères, thus getting fresh French speaking subjects In 1558 Geneva renewed her alliance with Bern, and in 1584 she made one with Zurich

The Counter Reformation

The decrees of the council of Trent had been accepted fully by the Catholic members of the League, so far as relates to dogma, but not as regards discipline or the relations of church and state, the sovereign rights and jurisdiction of each state being always carefully reserved The Counter Reformation, however, or reaction in favour of the old faith, was making rapid progress in the Confederation, mainly through the indefatigable exertions of Charles Borromeo, from 1560 to 1584 archbishop of Milan (in which diocese the Italian bailiwicks were included), and nephew of Pius IV, supported at Lucerne by Ludwig Pfyffer, who, having been (1562–1570) the chief of the Swiss mercenaries in the French wars of religion, did so much till his death (1594) to further the religious reaction at home that he was popularly known as the "Swiss king" In 1574 the Jesuits, the great order of the reaction, were established at Lucerne, in 1579 a papal nuncio came to Lucerne, Charles Borromeo founded the "Collegium Helveticum" at Milan for the education of forty-two young Swiss, and the Catholic members of the League made an alliance with the bishop of Basel, in 1581 the Capuchins were introduced to influence the more ignorant classes Most important of all was the Golden or Borromean League, concluded (October 5, 1586) between the seven Catholic members of the Confederation (Uri, Schwyz, Unterwalden, Lucerne, Zug, Freiburg, and Solothurn) for the maintenance of the true faith in their territories, each engaging to punish backsliding members and to help each other if attacked by external enemies, notwithstanding any other leagues, old or new This league marks the final breaking up of the Confederation into two great parties, which greatly hindered its progress The Catholic members had a majority in the diet, and were therefore able to refuse admittance to Geneva, Strasburg, and Muhlhausen Another result of these religious differences was the breaking up of Appenzell into two bits (1597), each sending one representative to the diet—"Inner Rhoden" remaining Catholic, "Ausser Rhoden" adopting the new views We may compare with this the action of Zurich in 1555, when she received the Protestant exiles from Locarno and the Italian bailiwicks into her burghership, and Italian names are found there to this day (*e g*, Orelli, Muralt) The duke of Savoy made several vain attempts to get hold of Geneva, the last (in 1602) being known as the "Escalade."

In the Thirty Years' War the Confederation remained neutral, being bound both to Austria (1474) and to France (1516), and neither religious party wishing to give the other an excuse for calling in foreign armies. But the troubles in Rhætia threatened entanglements Austria wished to secure the Munsterthal (belonging to the League of the Ten Jurisdictions), and Spain wanted the command of the passes leading from the Valtelline (conquered by the leagues of Rhætia in 1512), the object being to connect the Hapsburg lands of Tyrol and Milan In the Valtelline the rule of the Three Leagues was very harsh, and Spanish intrigues easily brought about the massacre of 1620, by which the valley was won, the Catholic members of the Confederation stopping the troops of Zurich and Bern In 1622 the Austrians conquered the Prattigau, over which they still had certain feudal rights French troops regained the Valtelline in 1624, but it was lost once more in 1629 to the imperial troops, and it was not till 1635 that the French, under Rohan, finally succeeded in holding it The French, however, wished to keep it permanently, hence new troubles arose, and in 1637 the natives, under George Jenatsch, with Spanish aid drove them out, the Spaniards themselves being forced to resign it in 1639 It was only in 1649–52 that the Austrian rights in the Prattigau were finally bought up by the League of the Ten Jurisdictions, which thus gained its freedom

In consequence of Ferdinand II's edict of restitution (1629), by which the *status quo* of 1552 was re-established —the high-water mark of the Counter Reformation—the abbot of St Gall tried to make some religious changes in his territories, but the protest of Zurich led to the Baden compromise of 1632, by which, in the case of disputes on religious matters arising in the "common bailiwicks," the decision was to be, not by a majority, but by means of friendly discussion—a logical application of the doctrine of religious parity—or by arbitration

Formal freedom from the empire.

But by far the most important event in Swiss history in this age is the formal freeing of the Confederation from the empire. Basel had been admitted a member of the League in 1501, two years after the Confederation had been practically freed from the jurisdiction of the imperial chamber, though the city was included in the new division of the empire into "circles" (1521), which did not take in the older members of the Confederation Basel, however, refused to admit this jurisdiction, the question was taken up by France and Sweden at the congress of Munster, and formed the subject of a special clause in the treaties of Westphalia, by which the city of Basel and the other "Helvetiorum cantones" were declared to be "in the possession of almost entire liberty and exemption from the empire, and *nullatenus* subject

to the imperial tribunals" This was intended to mean exemption from all obligations to the empire (with which the Confederation was connected hereafter simply as a friend), and to be a definitive settlement of the question Thus by the events of 1499 and 1648 the Confederation had become an independent European state, which, by the treaty of 1516, stood as regards France in a relation of neutrality

In 1668, in consequence of Louis XIV's temporary occupation of the Franche Comté, an old scheme for settling the number of men to be sent by each member of the Confederation to the joint army, and the appointment of a council of war in war time, that is, an attempt to create a common military organization, was accepted by the diet, which was to send two deputies to the council, armed with full political powers This agreement, known as the *Defensionale*, is the only instance of joint and unanimous action in this miserable period of Swiss history, when religious divisions crippled the energy of the Confederation

French influence, religious divisions, and rise of an aristocracy

Throughout the 17th and 18th centuries the Confederation was practically a dependency of France In 1614 Zurich for the first time joined in the treaty, which was renewed in 1663 with special provisions as regards the Protestant Swiss mercenaries in the king's pay and a promise of French neutrality in case of civil war in the League The Swiss had to stand by while Louis XIV won Alsace (1648), Franche Comté (1678) and Strasburg (1681) But, as Louis inclined more and more to an anti-Protestant policy, the Protestant members of the League favoured the Dutch military service, and it was through their influence that in 1707 the "states" of the principality of Neuchâtel, on the extinction of the Longueville line of these princes, decided in favour of the king of Prussia (representing the overlords—the house of Challon-Orange) as against the various French pretenders claiming from the Longueville dynasty by descent or by will In 1715 the Catholic members of the League, in hopes of retrieving their defeat of 1712 (see below), agreed, while renewing the treaty and capitulations, to put France in the position of the guarantor of the League, with rights of interfering, in case of attack from within or from without, whether by counsel or arms This last clause was simply the surrender of Swiss independence, and was strongly objected to by the Protestant members of the Confederation, so that in 1777 it was dropped, when all the Confederates made a fresh defensive alliance, wherein their sovereignty and independence were expressly set forth Thus France had succeeded to the position of the empire with regard to the Confederation, save that her claims were practically asserted and voluntarily admitted

Between 1648 and 1798 the Confederation was distracted by religious divisions, and feelings ran very high A scheme to set up a central administration fell through in 1655, through jealousy of Bern and Zurich, the proposers In 1656 a question as to certain religious refugees, who were driven from Schwyz and took refuge at Zurich, brought about the first Villmergen war, in which the Catholics were successful, and procured a clause in the treaty asserting very strongly the absolute sovereignty in religious as well as in political matters of each member of the League within its own territories Later, the attempt of the abbot of St Gall to enforce his rights in the Toggenburg swelled into the second Villmergen war (1712), which turned out very ill for the defeated Catholics Zurich and Bern were henceforth to hold in severalty Baden, Rapperschwyl, and part of the "common bailiwicks" of the Aargau, both towns being given a share in the government of the rest, and Bern in that of Thurgau and Rheinthal, from which as well as from that part of Aargau she had been carefully excluded in 1415 and 1460 The only thing that prospered was the principle of "religious parity," which was established by every treaty

The diet had few powers, the Catholics had the majority there, the sovereign rights of each member of the League and the limited mandate of the envoys effectually checked all progress Zurich, as the leader of the League, managed matters when the diet was not sitting, but could not enforce her orders The Confederation was little more than a collection of separate atoms, and it is really marvellous that it did not break up through its own weakness

In these same two centuries, the chief feature in domestic Swiss politics is the growth of an aristocracy the power of voting and the power of ruling are placed in the hands of a small class This is chiefly seen in Bern, Lucerne, Freiburg, and Solothurn, where there were not the primitive democracies of the Forest districts nor the government by guilds as at Zurich, Basel, and Schaffhausen It was effected by refusing to admit any new burghers, a practice which dates from the middle of the 16th century, and is connected (like the similar movement in the smaller local units of the "communes" in the rural districts) with the question of poor relief after the suppression of the monasteries Outsiders (Hintersassen or Niedgelassene) had no political rights, however long they might have resided, while the privileges of burghership were strictly hereditary Further, within the burghers, a small class succeeded in securing the monopoly of all public offices, which was kept up by the practice of co-opting, and was known as the "patriciate" So in Bern, out of 360 burgher families, 80 (in 1776 18 only) formed the ruling oligarchy, and, though to foreigners the government seemed admirably managed, yet the last thing that could be said of it was that it was democratic. In 1749 Henzi made a fruitless attempt to overthrow this oligarchy, like Fatio at Geneva in 1707 The harsh character of Bernese rule (and the same holds good with reference to Uri and the Val Leventina) was shown in the great strictness with which Vaud was kept in hand it was ruled as a conquered land by a benevolent despot, and we can feel no surprise that Davel in 1723 tried to free his native land, or that it was in Vaud that the principles of the French Revolution were most eagerly welcomed Another result of this aristocratic tendency was the way in which the cities despised the neighbouring country districts, and managed gradually to deprive them of their equal political rights and to levy heavy taxes upon them These and other grievances (the fall in the price of food after the close of the Thirty Years' War, the lowering of the value of the coin, &c), combined with the presence of many soldiers discharged after the great war, led to the great Peasant Revolt (1653) in the territories of Bern, Solothurn, Lucerne, and Basel, interesting historically as being the first popular rising since the old days of the 13th and 14th centuries, and because reminiscences of legends connected with those times led to the appearance of the "three Tells," who greatly stirred up the people. The rising was put down at the cost of much bloodshed, but the demands of the peasants were not granted Yet during this period of political powerlessness a Swiss literature first arises Gessner and Tschudi in the 16th century are succeeded by Scheuchzer, Haller, Lavater, Bodmer, De Saussure, Rousseau, J von Muller, the taste for Swiss travel is stimulated by the publication of Ebel's guide-book, based on the old *Deliciæ*; industry throve greatly The residence of such brilliant foreign writers as Voltaire and Gibbon within or close to the territories of the Confederation helped on this remarkable intellectual revival Political aspirations were not, however, wholly crushed, and found their centre in the Helvetic Society, founded in 1762 by Balthasar and others

Effects of the French Revolution on the Confederation.

The Confederation and France had been closely connected for so long that the outbreak of the French Revolution could not fail to affect the Swiss. The Helvetian Club, founded at Paris in 1790 by several exiled Vaudois and Freiburgers, was the centre from which the new ideas were spread in the western part of the Confederation, and risings directed or stirred up. In 1790 Lower Wallis rose against the oppressive rule of the upper districts; in 1792 Porrentruy defied the prince-bishop of Basel, despite the imperial troops he summoned, declared the "Rauracian" republic, and three months later became the French department of the Mont Terrible; Geneva was only saved (1792) from France by a force sent from Zurich and Bern; and the massacre of the Swiss guard at the Tuileries on August 10, 1792, aroused intense indignation. The rulers, however, unable to enter into the new ideas, contented themselves with suppressing them by force, *e.g.*, Zurich in the case of Stafa (1795). St Gall managed to free itself from its abbot (1795–97), but the Leagues of Rhætia so oppressed their subjects in the Valtelline that in 1797 Bonaparte (after conquering the Milanese from the Austrians) joined them to the Cisalpine republic. The diet was distracted by party struggles, and the fall of the old Confederation was not far distant. The rumours of the vast treasures stored up at Bern, and the desire of securing a bulwark against Austrian attack, specially turned the attention of the Directory towards the Confederation; and this was utilized by the heads of the reform party in the Confederation,—Ochs, the burgomaster of Basel, and La Harpe, who had left his home in Vaud through disgust at Bernese oppression, both now wishing for aid from outside in order to free their land from the rule of the oligarchy. Hence, when La Harpe, at the head of twenty-two exiles from Vaud and Freiburg, called (November 20, 1797) on the Directory to protect the liberties of Vaud, which France by the treaty of 1565 was bound to guarantee, his appeal found a ready answer. In 1798 French troops occupied Mulhausen and Bienne (Biel), as well as those parts of the lands of the prince-bishop of Basel (St Imier and the Munsterthal) as regards which he had been since 1579 the ally of the Catholic members of the Confederation. Another army entered Vaud (February 1798), when the "Lemanic republic" was proclaimed, and the diet broke up in dismay without taking any steps to avert the coming storm. Brune and his army occupied Freiburg and Solothurn, and, after fierce fighting at Neueneck, entered (March 5) Bern, deserted by her allies, and distracted by quarrels within. With Bern, the stronghold of the aristocratic party, fell the old Confederation. The Revolution triumphed throughout the Confederation. Brune, on March 19, put forth a wonderful scheme by which the Confederation with its "associates" and "subjects" was to be split into three republics—the Tellgau (*i.e.*, the Forest districts), the Rhodanic (*i.e.*, Vaud, Wallis, the Bernese Oberland, and the Italian bailiwicks), and the Helvetic (*i.e.*, the north and east portions), but the Directory disapproved of this (March 23)

The Helvetic republic.

and on March 29 the Helvetic republic, one and indivisible, was proclaimed. This was accepted by ten out of the thirteen members of the old Confederation, as well as the constitution drafted by Ochs. By the new scheme the territories of the Everlasting League were split up into twenty-three (later nineteen, Rhætia only coming in in 1799) administrative districts, called "cantons," a name now officially used in Switzerland for the first time, though it may be found employed by foreigners in the French treaty of 1452, in Comines and Machiavelli, and in the treaties of Westphalia (1648). A central Government was set up, with its seat at Lucerne, comprising a senate and a great council, together forming the legislature, with an executive of five directors chosen by the legislature, and having four ministers as subordinates or "chief secretaries." A supreme court of justice was set up; a status of Swiss citizenship was recognized; and absolute freedom to settle in any canton was given, the political "communes" being now composed of all residents, and not merely of the burghers. For the first time an attempt was made to organize the Confederation as a single state, but the change was too sweeping to last, for it largely ignored the local patriotism which had done so much to create the Confederation, though more recently it had made it politically powerless. The three Forest districts rose in rebellion against the invaders and the new constitutions which destroyed their ancient prerogatives; but the valiant resistance of the Schwyzers, under Alois Reding, on the heights of Morgarten (April and May), and that of the Unterwaldners (September), were put down by French armies. The proceedings of the French, however, soon turned into disgust and hatred the joyful feelings with which they had been hailed as liberators. Geneva was annexed to France (1798); Gersau, after an independent existence of over 400 years, was made a mere district of Schwyz; immense fines were levied and the treasury at Bern pillaged; the land was treated as if it had been conquered. The new republic was compelled to make a very close offensive and defensive alliance with France, and its directors were practically nominated from Paris. In 1799 Zurich, the Forest cantons, and Rhætia became the scene of the struggles of the Austrians (welcomed with joy) against the French and Russians. The manner too in which the reforms were carried out alienated many, and, soon after the Directory gave way to the Consulate in Paris (18 Brumaire or November 10, 1799), the Helvetic directory (January 1800) was replaced by an executive committee.

The Act of Mediation.

The scheme of the Helvetic republic had gone too far in the direction of centralization; but it was not easy to find the happy mean, and violent discussions went on between the "unitary" (headed by Ochs and La Harpe) and "federalist" parties. Many drafts were put forward, and one actually submitted to but rejected by a popular vote (May 20, 1802). In July 1802 the French troops were withdrawn from Switzerland by Bonaparte, ostensibly to comply with the treaty of Amiens, really to show the Swiss that their best hopes lay in appealing to him. The Helvetic Government was gradually driven back by armed force, and the federalists seemed getting the best of it, when (October 4) Bonaparte offered himself as mediator, and summoned many of the chief Swiss statesmen to Paris to discuss matters with him (the "Consulta"—December 1802). He had long taken a very special interest in Swiss matters, and in 1802 had given to the Helvetic republic the Fricktbal (ceded to France in 1801 by Austria), the last Austrian possession within the borders of the Confederation. On the other hand, he had made (November 1802) Wallis into an independent republic. In the discussions he pointed out that Swiss needs required a federal constitution and a neutral position guaranteed by France. Finally (February 19, 1803) he laid before the Consulta the Act of Mediation which he had elaborated, and which they had perforce to accept—a document which formed a new departure in Swiss history, and the influence of which is visible in the present constitution.

Throughout, "Switzerland" is used for the first time as the official name of the Confederation. The thirteen members of the old Confederation before 1798 are set up again, and to them are added six new cantons,—two (St Gall and Graubunden or Grisons) having been formerly "associates," and the four others being made up of the

subject lands conquered at different times,—Aargau (1415), Thurgau (1460), Ticino or Tessin (1440, 1500, 1512), and Vaud (1536). In the diet, six cantons which had a population of more than 100,000 (viz., Bern, Zurich, Vaud, St Gall, Graubunden, and Aargau) were given two votes, the others having but one apiece, and the deputies were to vote freely within limits, though not against their instructions. Meetings of the diet were to be held alternately at Freiburg, Bern, Solothurn, Basel, Zurich, and Lucerne,—the Government of each of these cantons becoming, by virtue of the presence of the diet, the executive of the Confederation, its chief magistrate being named the "landamman of Switzerland." The "landsgemeinden," or popular assemblies, were restored in the democratic cantons, the cantonal governments in other cases being in the hands of a "great council" (legislative) and the "small council" (executive),—a property qualification being required both for voters and candidates. No canton was to form any political alliances abroad or at home. The "communes" were given larger political rights, the burghers who owned and used the common lands becoming more and more private associations. There was no Swiss burghership, as in 1798, but perfect liberty of settlement in any canton. There were to be no privileged classes or subject lands. A very close alliance with France (on the basis of that of 1516) was concluded. The whole constitution and organization were far better suited for the Swiss than the more symmetrical system of the Helvetic republic, but, as it was guaranteed by Bonaparte, and his influence was predominant, the whole fabric was closely bound up with him, and fell with him. Excellent in itself, the constitution set forth in the Act of Mediation failed by reason of its setting.

The pact of 1815

For ten years Switzerland enjoyed peace and prosperity under the new constitution. Pestalozzi and Fellenberg worked out their educational theories, K. Escher of Zurich embanked the Linth, and was thence called "von der Linth", the central Government prepared many schemes for the common welfare. On the other hand, the mediator (who became emperor in 1804) lavishly expended his Swiss troops, the number of which could only be kept up by a regular blood tax, while the "Berlin decrees" raised the price of many articles. In 1806 the principality of Neuchâtel was given to Marshal Berthier; Tessin was occupied by French troops from 1810 to 1813, and in 1810 Wallis was made into the department of the Simplon, so as to secure that pass. At home, the liberty of moving from one canton to another (though given by the constitution) was, by the diet in 1805, restricted by requiring ten years' residence, and then not granting political rights in the canton or a right of profiting by the communal property. As soon as Napoleon's power began to wane (1812–13), the position of Switzerland became endangered. Despite the personal wishes of the czar (a pupil of La Harpe's), the Austrians, supported by the reactionary party in Switzerland, and without any real resistance on the part of the diet, as well as the Russian troops, crossed the frontier on December 21, 1813, and a few days later the diet was induced to declare the abolition of the 1803 constitution, guaranteed, like Swiss neutrality, by Napoleon. Bern headed the party which wished to restore the old state of things, but Zurich and the majority stood out for the nineteen cantons. The powers exercised great pressure to bring about a meeting of deputies from all the nineteen cantons at Zurich (April 6, 1814, "the long diet"), but party strife was so bitter that many questions had to be referred to the congress sitting at Vienna. The congress decided (March 20, 1815) that Wallis, Neuchâtel, and Geneva should be raised from the rank of "associates" to that of full members of the confederation (thus making up the familiar twenty-two), and as compensation gave Bern the town of Bienne (Biel) and all (save a small bit which went to Basel) of the territories of the prince-bishop of Basel ("the Bernese Jura"), but the Valtelline was granted to Austria, and Muhlhausen was not freed from France.

The diet accepted this decision, and on August 7, 1815, the new constitution was sworn to by all the cantons save Nidwald, the consent of which was only obtained by armed force, a delay for which she paid by seeing Engelberg and the valley above (acquired by Nidwald in 1798) given to Obwald. By the new constitution the sovereign rights of each canton were fully recognized, and a return made to the lines of the old constitution, though there were to be no subject lands, and political rights were not to be the exclusive privilege of any class of citizens. Each canton had one vote in the diet, where an absolute majority was to decide all matters save foreign affairs, when a majority of three-fourths was required. The management of current business, &c., shifted every two years between the Governments of Zurich, Bern, and Lucerne (the three "Vororte"). The monasteries were guaranteed in their rights and privileges, and no canton was to make any alliance contrary to the rights of the Confederation or of any other canton. Provision was made for a federal army. Finally the congress, on November 20, 1815, placed Switzerland and parts of North Savoy (Chablais, Faucigny, and part of the Genevois) under the guarantee of the great powers, who engaged to maintain their neutrality, thus freeing Switzerland from her 300 years' subservience to France, and compensating in some degree for the reactionary nature of the new Swiss constitution when compared with that of 1803.

Attempts at reform

V. The cities at once secured for themselves in the cantonal great councils an overwhelming representation over the neighbouring country districts, and the agreement of 1805 as to migration from one canton to another was renewed by twelve cantons. For some time there was little talk of reforms, but in 1819 the Helvetic Society definitely became a political society, and the foundation in 1821 of the Marksmen's Association enabled men from all cantons to meet together. A few cantons (notably Tessin) were beginning to make reforms, when the influence of the July revolution (1830) in Paris and the sweeping changes in Zurich led the diet to declare (December 27) that it would not interfere with any reforms of cantonal constitutions provided they were in agreement with the pact of 1815. Hence for the next few years great activity in this direction was displayed, and most of the cantons reformed themselves, save the most conservative (*e.g.*, Uri, Glarus) and the advanced who needed no changes (*e.g.*, Geneva, Graubunden). Provision was always made for revising these constitutions at fixed intervals, for the changes were not felt to be final, and seven cantons—Zurich, Bern, Lucerne, Solothurn, St Gall, Aargau, and Thurgau—joined together to guarantee their new free constitutions (Siebener Concordat of March 17, 1832). Soon after, the question of revising the federal pact was brought forward by a large majority of cantons in the diet (July 17), whereon, by the league of Sarnen (November 14), the three Forest cantons, with Neuchâtel, the city of Basel, and Wallis, agreed to maintain the pact of 1815 and to protest against the separation of Basel in two halves (for in the reform struggle Schwyz and Basel had been split up, though the split was permanent only in the latter case). A draft constitution providing for a federal administration distinct from the cantons could not secure a majority in its favour, a reaction against reform set in, and the diet was forced to sanction (1833) the division of

Basel into the "city" and "country" divisions (each with half a vote in the diet), though fortunately in Schwyz the quarrel was healed. Religious quarrels further stirred up strife in connexion with Aargau, which was a canton where religious parity prevailed, later in others. In Zurich the extreme pretensions of the radicals and freethinkers (illustrated by offering a chair of theology in the university to Strauss because of his recent *Life of Jesus*) brought about a great reaction in 1839, when Zurich was the "Vorort." In Aargau the parties were very evenly balanced, and, when in 1840, on occasion of the revision of the constitution, the radicals had a popular majority, the aggrieved clerics stirred up a revolt (1840), which was put down, but which gave their opponents (headed by A. Keller) the excuse for carrying a vote in the great council to suppress the eight monasteries in the canton. This was flatly opposed to the pact of 1815, which the diet by a small majority decided must be upheld, though after many discussions it determined (August 31, 1843) to accept the compromise by which four only were to be suppressed, and declared that the matter was now settled. On this the seven Catholic cantons—Uri, Schwyz, Unterwalden, Lucerne, Zug, Freiburg, and Wallis—formed (September 7, 1843) a "Sonderbund" or separate league, which (February 1844) issued a manifesto demanding the reopening of the question and the restoration of *all* the monasteries. Like the radicals in former years the Catholics went too far and too fast, for in October 1844 the clerical party in Lucerne (in the majority since 1841, and favouring the reaction in Wallis) officially invited in the Jesuits and gave them high posts, an act which created all the more sensation because Lucerne was the "Vorort." Twice (December 1844 and March 1845) parties of Free Lances tried to capture the city. In December 1845 the Sonderbund turned itself into an armed confederation, ready to appeal to war in defence of the rights of each canton. The radicals carried Zurich in 1845 and Bern in 1846, but a majority could not be secured in the diet till Geneva (October 1846) and St Gall (May 1847) were won by the same party. On July 20, 1847, the diet, by a small majority, declared that the Sonderbund was contrary to the federal pact, which on August 16 it was resolved to revise, while on September 3 it was decided to invite each canton to expel the Jesuits. Most of the great powers favoured the Sonderbund, but England took the contrary view. On October 29 the deputies of the unyielding cantons left the diet, which ordered on November 4 that its decree should be enforced by arms. The war was short (November 11–29), mainly owing to the ability of Dufour, and the loss of life trifling. One after another the rebellious cantons were forced to surrender, and, as the Paris revolution of February 1848 occupied all the attention of the great powers (who by the constitution of 1815 should have been consulted in the revision of the pact), the Swiss were enabled to settle their own affairs quietly. Schwyz and Zug abolished their "landsgemeinden," and the seven were condemned to pay the costs of the war (ultimately defrayed by subscription), which had been waged rather on religious than on strict particularist or states-rights grounds. The diet meanwhile debated the draft constitution drawn up by Kern of Thurgau and Druey of Vaud, which in the summer of 1848 was accepted by fifteen and a half cantons, the minority consisting of the three Forest cantons, Wallis, Zug, Tessin, and Appenzell (Inner Rhoden), and it was proclaimed on September 12.

Constitution of 1848.

The new constitution inclined rather to the Act of Mediation than to the system which prevailed before 1798. A status of "Swiss citizenship" was set up, closely joined to cantonal citizenship; a man settling in a canton not being his birthplace got cantonal citizenship after two years, but was excluded from all local rights in the "commune" where he might reside. A federal or central Government was set up, to which the cantons gave up a certain part of their sovereign rights, retaining the rest. The federal legislature (or assembly) was made up of two houses—the council of states (Stande Rath), composed of two deputies from each canton, whether small or great[1] (44 in all), and the national council (National Rath), made up of deputies (now 145 in number) elected for three years, in the proportion of one for every 20,000 souls or fraction over 10,000, the electors being all Swiss citizens. The federal council or executive (Bundesrath) consisted of seven members elected by the federal assembly; they are jointly responsible for all business, though for sake of convenience there are various departments, and their chairman is called the president of the Confederation. The federal judiciary (Bundesgericht) is made up of eleven members elected by the federal assembly for three years; its jurisdiction is chiefly confined to civil cases, in which the Confederation is a party (if a canton, the federal council may refer the case to the federal tribunal), but takes in also great political crimes,—all constitutional questions, however, being reserved for the federal assembly. A federal university and a polytechnic school were to be founded; the latter only has as yet been set up, and is fixed at Zurich. All military capitulations were forbidden in the future. Every canton must treat Swiss citizens who belong to one of the Christian confessions like their own citizens, for the right of free settlement is given to all such, though they acquired no rights in the "commune." All Christians were guaranteed the exercise of their religion, but the Jesuits and similar religious orders were not to be received in any canton. German, French, and Italian were recognized as national languages.

The constitution as a whole marked a great step forwards, though very many rights were still reserved to the cantons, yet there was a fully organized central government. Almost the first act of the federal assembly was to exercise the power given them of determining the home of the federal authorities, and on November 28, 1848, Bern was chosen, though Zurich still ranks as the first canton in the Confederation.

By this early settlement of disputes Switzerland was protected from the general revolutionary movement of 1848, and in later years her political history has been uneventful, though she has felt the weight of the great European crisis in industrial and social matters.

Events since 1848.

The position of Neuchâtel, as a member of the Confederation (as regards its government only) and as a principality ruled by the king of Prussia, whose rights had been expressly recognized by the congress of Vienna, was uncertain. She had not sent troops in 1847, and, though in 1848 there was a revolution there, the prince did not recognize the changes. Finally, a royalist conspiracy in September 1856 to undo the work of 1848 caused great excitement and anger in Switzerland, and it was only by the mediation of Napoleon III. and the other powers that the prince renounced (1857) all his rights, save his title, which his successor (the German emperor) has also dropped. Since that time Neuchâtel has been an ordinary member of the Confederation. In 1859–60 the cession of Savoy (part of it neutralized in 1815) to France aroused considerable indignation, and in 1862 the long-standing question of frontiers in the Vallée de Dappes was finally arranged

[1] The method of election and length of term of office were left to the cantonal Governments, at present (1887), in eleven cantons (or half cantons) the people, in fourteen the "great council," elect, twelve elect for one year and twelve for three, Wallis holding to the mean of two years.

with France In 1871 many French refugees, especially Bourbaki's army, were most hospitably received and sheltered The growth of the Old Catholics after the Vatican council (1870) caused many disturbances in western Switzerland, especially in the Bernese Jura The attack was led by Bishop Lachat of Basel, whose see was suppressed by several cantons in 1873 The Old Catholics have been recognized by nine cantons and the see of Basel set up again, though Bern does not recognize it The appointment by the pope of the abbé Mermillod as "apostolic vicar" of Geneva, which was separated from the diocese of Freiburg, led to Monseigneur Mermillod's banishment from Switzerland (1872), but in 1883 he was raised to the vacant see of Freiburg and allowed by the federal authorities to return, though Geneva still refuses to recognize him Perhaps the latest event of importance to Switzerland was the opening of the St Gotthard tunnel, which was begun in 1871 and ended in 1880, by it the Forest cantons seem likely to regain the importance which was theirs in the early days of the Confederation

From 1848 onwards the cantons continually revised their constitutions, always in a democratic sense, though after the Sonderbund War Schwyz and Zug abolished their "landsgemeinde" The chief point was the introduction of the *referendum*, by which laws made by the cantonal legislature may (facultative *referendum*) or must (obligatory *referendum*) be submitted to the people for their approval, and this has obtained such general acceptance that Freiburg alone does not possess the *referendum* in either of its two forms, Tessin having accepted it in its optional form in 1883 It was therefore only natural that attempts should be made to revise the federal constitution of 1848 in a democratic and centralizing sense, for it had been provided that the federal assembly, on its own initiative or on the written request of 50,000 Swiss electors, could submit the question of revision to a popular vote In 1866 the restriction of certain rights (mentioned above) to Christians only was swept away, but the attempt at final revision in 1872 was defeated by a small majority, owing to the efforts of the anti centralizing party Finally, however, another draft was better liked, and on April 19, 1874, the new constitution was accepted by the people—11½ cantons against 7½ (those of 1848 without Tessin, but with Freiburg and Lucerne) and 340,199 votes as against 198,013

Revised constitution of 1874

This constitution is that now in force, and is simply an improved edition of that of 1848 The federal tribunal (now of nine members only) was fixed (by federal law) at Lausanne, and its jurisdiction enlarged, especially in constitutional disputes between cantons and the federal authorities, though jurisdiction in administrative matters (*e g*, educational, religious, election, commercial) is given to the federal council, a division of functions which is very anomalous, and does not work well A system of free elementary education was set up, and many regulations made on ecclesiastical matters A man settling in another canton was, after a residence of three months only, given all cantonal and communal rights, save a share in the common property (an arrangement which as far as possible kept up the old principle that the "commune" is the true unit out of which cantons and the Confederation are built), and the membership of the "commune" carries with it cantonal and federal rights. The *referendum* was introduced in its "facultative" form, *i e*, all federal laws must be submitted to popular vote on the demand of 30,000 Swiss electors or of eight cantons. If the revision of the federal constitution is demanded by one of the two houses of the federal assembly or by 50,000 Swiss citizens, the question of revision must be submitted to a popular vote, as also the draft of the revised constitution,—these provisions, contained already in the constitution of 1848, forming a species of "obligatory *referendum*" It was supposed that this plan would lead to radical and sweeping changes, but as a matter of fact there have been (1874–86) about one hundred and seven federal laws and resolutions passed by the assembly, of which nineteen were by the *referendum* submitted to popular vote, thirteen being rejected, while six only were accepted,—the rest becoming law as no *referendum* was demanded There has been a very steady opposition to all schemes aiming at increased centralization By the constitutions of 1848 and 1874 Switzerland has ceased to be a mere union of independent states joined by a treaty, and has become a single state with a well-organized central Government, to which have been given certain of the rights of the independent cantons, but increased centralization would destroy the whole character of the Confederation, in which the cantons are not administrative divisions but living political communities Swiss history teaches us, all the way through, that Swiss liberty has been won by a close union of many small states, and we cannot doubt that it will be best preserved by the same means, and not by obliterating all local peculiarities, nowhere so striking and nowhere so historically important as in Switzerland

Chronological Table of Chief Events

1291	First League of the Three Lands	1513	The Thirteen complete
1315	Morgarten	1516	Alliance with France
1353	The Eight Orte complete	1531	Kappel
1386	Sempach	1586	Golden League
1388	Näfels	1648	Formal Freedom from the Empire
1394	Hapsburgs give up rights	1798	The Helvetic Republic
1444	St Jakob an der Birs	1803	Act of Mediation—19 Cantons
1474	Everlasting Compact	1815	Federal Pact—22 Cantons
1476	Granson and Morat	1847	Sonderbund War
1481	Compact of Stanz	1848	Federal Constitution
1499	Practical Freedom from the Empire	1874	Revised Constitution

General Authorities—For the early history, the works of Huber, Rilliet, and Von Wyss (see TELL) may be consulted, for general political history those of Daguet, Dändliker (large and small versions), Henne am Rhyn, Oechsli, Strickler, Vulliemin, and, for constitutional history, those of Blumer, Bluntschli, Dubs, Meyer, and Orelli Of those named, the works of Rilliet, Dändliker (the small version), Strickler, Dubs, and Orelli are best suited for foreign readers Books on local history and on special periods abound, and many very valuable essays are hidden in the publications of the numerous cantonal historical societies Of modern English works relating to Switzerland the most noteworthy are G Grote, *Seven Letters concerning the Politics of Switzerland* [the Sonderbund War of 1847] (originally published 1847, reprinted 1876), and E A Freeman, "Review of Kirk's 'Charles the Bold,'" in *Historical Essays*, first series, 1872, pp 335–370, and *Historical Geography of Europe*, 1881 The great *Historisch Geographischer Atlas der Schweiz*, by Vögelin, Meyer von Knonau, and Von Wyss (Zurich, 1870), is almost indispensable to any serious student of Swiss history Gerster's small maps are appended to Oechsli's history, and also published separately (W A B C)

PART III —LITERATURE

It can hardly be said of Switzerland that she possesses a truly national literature She has a literature in French and a literature in German, but these literatures are not the expression of a common intellectual life, for the German and French cantons have always been to some extent dominated by different ideas and sympathies Political union has been only in part associated with the deeper union which relates to purely ideal interests Even the difference between the French and the German literatures of Switzerland does not give a complete conception of the diversity of thought and sentiment which exists in the country Switzerland has also produced Italian writers and writers who use the Romansch dialect of the Grisons The Romansch and Italian branches of her literature are not, however, sufficiently important to deserve more than passing notice

During the struggles against the Hapsburgs the members of the Confederation were too seriously occupied in defending their political rights and in adding to their territory to be very eager for the satisfaction of intellectual needs They produced some vigorous war songs, but in other respects they were content with such literature as

might happen to reach them from neighbouring countries. At the time of the Reformation there was much intellectual activity in Switzerland, but it related chiefly to the controversy of the Protestants with the Church of Rome; and Zwingli, Bullinger, and the other Reformers of the German cantons were not, like Luther, wise enough to write important treatises in the language of the people. They wrote chiefly in Latin, reserving the use of German for sermons and hymns. One good writer of this period whose interest was not confined to theology was François Bonnivard, who, although a native of Savoy, had, as prior of the monastery of St Victor, been associated with Geneva before the Reformation. He was one of the most resolute of those who opposed the ambition of Charles III., duke of Savoy; and it is he whose sufferings in the service of his adopted country have been immortalized by Byron in "The Prisoner of Chillon." After his release from imprisonment he became a Protestant, and wrote in French several important books, the chief of which is his *Chroniques de Genève*. This work is written in a bright and animated style, and is especially valuable for its account of events with which the author himself was connected.

Bonnivard

Tschudi

Another vigorous writer of the 16th century was Ægidius Tschudi, who remained loyal to the Roman Church. He devoted himself with enthusiasm to the study of history. The only result of his labours given to the world in his lifetime was *Die uralt warhafftig alpisch Rhætia*, but several other works have since been published, the most important being his *Chronicon Helveticum* and his *Hauptschlussel zu verschiedenen Alterthumern*.

After the Reformation a respect for learning was maintained by the university of Basel, the Carolinum of Zurich, and various other educational institutions in the leading towns of the Confederation; but for a long time Switzerland took little part in the literary movement of Europe. Theology was still generally thought to be the only subject worthy of study by serious minds, and theologians continued to write their books in Latin (as, for example, C. Gessner of Zurich). In this respect their example was followed by men of science. In the few instances in which scholars belonging to German cantons wished to appeal to readers who were not specialists, they wrote in French, for Switzerland was so intimately associated in politics with France that the French language was spoken by the educated classes in all parts of the country. French literature was the only modern literature of which they had any real knowledge.

Early in the 18th century there were many signs of an intellectual awakening both in the German and in the French districts. The literary activity manifested in the German cantons was indirectly connected with the fact that they had been gradually acquiring a stronger sense of political independence. They had been alienated from France by the arrogance of the French Government, and had been forced to consider whether it might not be possible for Switzerland to defend her own interests without foreign patronage. Here and there scholars began to interest themselves in Swiss history, and to take pride in the achievements of the forefathers of the republic; and, in proportion as patriotic sentiment increased, thoughtful men became less inclined to take all their ideas from the country to which alone they had hitherto looked for intellectual guidance. They studied with greater earnestness the literatures of Greece and Rome, and some of them turned to English literature, with which they had not up to this time had the slightest acquaintance. These influences gave a powerful impetus to the best aspirations of the German population of Switzerland, and it was not in literature only that important results were achieved. Members of the family of Bernoulli at the university of Basel had already been doing great work in mathematics; and now the fame of Switzerland as a country favourable to the development of science was extended by many investigators, the best known of whom were Euler, Haller, Scheuchzer, and Muralt.

Bodmer and Breitinger

The writer who first gave expression to the most characteristic literary conceptions of his time in Switzerland was J. J. Bodmer, a native of Zurich. He was a good classical scholar, and in youth had made himself familiar with some of the masterpieces of English, French, and Italian literature. In 1721, in association with his friend Breitinger, a learned Protestant clergyman in Zurich, he began to issue the *Discurse der Maler*, written in imitation of the style of the English essayists. In this periodical the two friends criticized freely the works of some popular German versifiers, and they wrote with so much force and confidence that they soon exercised considerable influence not only in Switzerland but in Germany. When the value of their work was beginning to be recognized, a high place was taken among German men of letters by Gottsched, a professor at Leipsic. He was an ardent admirer of the classic drama of France, and gathered around him a number of enthusiastic disciples, known as the Saxon school. For some time he was on friendly terms with the Swiss critics, with whom he agreed in condemning the wild extravagance of Lohenstein and his imitators. But when Bodmer and Breitinger went on to praise English literature, and to call attention especially to the splendid qualities of Milton, Gottsched denounced their opinions as utterly false and misleading. The result was that a bitter controversy broke out between the Saxon and Swiss schools, Bodmer and Breitinger presenting an elaborate statement of critical doctrine, the former in *Vom Wunderbaren in der Poesie* (1740), the latter in *Kritische Dichtkunst* (1740). The controversy was followed with great interest by many readers, and, although it was by and by almost forgotten, it helped to prepare the way for the outburst of German literature begun by Klopstock, Wieland, and Lessing. The theories of all the combatants were to some extent crude and even grotesque, but Bodmer and Breitinger did excellent service by the vigour with which they protested against the notion that poetry is merely the work of the understanding acting in subjection to rigid rules, and by their enthusiastic appreciation of great English writers. Bodmer also opened fresh sources of inspiration by editing a part of the *Nibelungenlied* and some poems of the Minnesinger,—undertakings in which he anticipated the labours of the Romantic school. He wrote an epic, the *Noachide*, and several dramas, but his work as a poet is feeble and unimportant in comparison with his achievements as an editor and critic.

Haller

A. von Haller, who made his fame chiefly as a man of science (see vol. xi. p. 396), ranked in literature also among the foremost men of his day. His poems are too directly didactic to give much pleasure to modern readers, but in some of them—especially *Die Alpen*—there are passages of striking force and beauty. Haller knew the Alps not merely from books but by having visited them, and to him belongs the credit of having revealed that they appeal powerfully to the imagination, and of having associated them with great thoughts and aspirations. He wrote several prose romances, but outside of Switzerland these works, which had many readers at the time of their publication, are now practically forgotten.

Gessner

A Swiss writer of the 18th century who, as a poet, became more famous even than Haller was Solomon Gessner. At Berlin and Hamburg he came under the influence of Ramler and Hagedorn, and after his return to his native town Zurich, where he lived as an artist, he published a series of idyllic poems which excited universal

admiration The most popular of his writings was his prose idyl, *Der Tod Abel's* (1758) This work was translated into many languages, and was received with not less favour in Germany, France, and England than in Switzerland There is not much serious thought in Gessner's works, and his sentiment sometimes degenerates into sentimentalism, but a permanent place is secured for him in literature by his simple, lucid style and by the delicate grace of his sketches of ideal scenery These qualities were warmly appreciated by Lessing and afterwards by Goethe

Salis-Seewis

Of the German Swiss poets who were born after Gessner had become famous the best were J G Salis-Seewis and J M Usteri Salis-Seewis was acquainted with Goethe, Schiller, Herder, and Wieland, but he was not so much influenced by them as by a greatly inferior poet, Matthison, whose ideas and methods closely resembled his own There is little variety of sentiment in the poems of Salis-Seewis, but their uniformity of tone is prevented from being tiresome by his perfect sincerity and by the vividness of his diction

Usteri

Usteri wrote at least one song—"Freut euch des Lebens"—which became popular among Germans of all classes, but his most important writings were some clever stories in the German dialect of Zurich

Philosophy, in the strict sense of the term, was not profoundly studied in the German cantons in the 18th century, but philosophical problems, especially those relating to ethics, were discussed in a popular style by a good many more or less able writers Of these writers one of

Zimmermann

the most renowned was J G Zimmermann His chief writings are *Ueber die Einsamkeit* (1755) and *Vom Nationalstolze* (1758) These works present a strange combination of cynicism and sentimentalism, but they profoundly impressed Zimmermann's contemporaries, and were trans-

Sulzer

lated into most European languages J G Sulzer spent the greater part of his life in Berlin, where he was held in much esteem at the time when Lessing was beginning to make a name as a critic and dramatist His principal work is his *Allgemeine Theorie der schonen Kunste*, in which he tried to present a complete exposition of the laws of art, starting with the philosophical principles of Wolf, and combining them with critical doctrines derived from English and French writers His style is somewhat cold and formal, and to later generations his governing

Hirzel

thoughts have seemed meagre and unfruitful H K Hirzel wrote *Das Bild eines wahren Patrioten* (1767) and various other works, in which he displayed a considerable power of expounding and illustrating great moral principles He is remembered chiefly, however, by a charming description which he wrote of a day spent by Klopstock and himself with some friends on the Lake of Zurich,—a day celebrated by Klopstock in one of the finest of his early

Lavater

odes J K Lavater made some reputation as a poet, but he owed his fame chiefly to his *Physiognomische Fragmente* (1775–78), in which he sought to develop the idea that the face presents a perfect indication of character, and that physiognomy may therefore be treated as a science. His notions are arbitrary and rather mystical, but he expressed them with so much vigour and enthusiasm that he found

Pestalozzi

many admirers and disciples J H Pestalozzi was a less pretentious but infinitely more useful writer than Lavater Early in life, mainly through the influence of Rousseau, he became impressed by the necessity of a radical change in the methods of popular education, and with splendid self-sacrifice he devoted his energies to the task of realizing his ideas and of inspiring others with a sense of their importance His writings—of which *Lienhard und Gertrud* is the best—are not distinguished by any remarkable literary qualities, but his theories made his name famous all over the civilized world, and children in every good school may still be said to profit indirectly by his labours

In the 18th century the German cantons produced many writers on historical subjects One of the most dis-

Iselin

tinguished of them was I Iselin, who, in his *Geschichte der Menschheit* (1768), offered suggestions akin to those which were afterwards set forth with wider knowledge and deeper insight by Herder J H Tschudi and J J Tschudi,

The Tschudis.

descendants of Ægidius Tschudi, also did much good work as historians Greater than any of these—the foremost historical writer of Switzerland—was J von Muller, whose

Muller

writings marked an era in German literature His masterpiece is his *Geschichte der schweizerischen Eidgenossenschaft* (1780) Muller had not an adequate appreciation of the laws of evidence in historical inquiry, but he was indefatigable in research, and no German historian of his time had so great a power of bringing out the significance of facts by his method of grouping them His style, although sometimes obscure and rhetorical, was often made warm and glowing by his eager love of freedom and justice

The literary movement of the French districts in the 18th century had little direct relation with that of the German cantons It sprang chiefly from the influence of French refugees, who flocked in great numbers to western Switzerland after the revocation of the edict of Nantes The most energetic of the French writers of Switzerland in the first half of the 18th century was Bourguet, the son of

Bourguet.

a refugee He travelled in Italy and Holland, and on his return to Geneva founded the *Bibliothèque Italique*, which appeared from 1729 to 1734 In carrying on this periodical, which extended to eighteen volumes, Bourguet was aided by a good many Swiss writers—among others by Abraham Ruchat and Loys de Bochat of Lausanne Bourguet's colleagues also contributed articles to French periodicals of a similar kind in Holland, three of which—the *Bibliothèque Universelle et Historique*, the *Bibliothèque Choisie*, and the *Bibliothèque Ancienne et Moderne*—were conducted by Jean le Clerc, a native of Geneva In 1732 Bourguet started at Neuchâtel the *Mercure Suisse*, which went on until 1784 and did much to stimulate the interest of its readers in science, literature, history, and archæology The indefatigable editor and his colleagues did not confine themselves to journalistic work One of his books—*Traité des Pétrifactions*—was an important contribution to geology, and Loys de Bochat wrote a careful book entitled *Mémoires Critiques sur l'Histoire Ancienne de la Suisse* Ruchat was the author of *Histoire de la Reformation de la Suisse* and of *Délices de la Suisse* The writings of J. P

Crousaz

de Crousaz, a friend of Bourguet, display no remarkable qualities, but two of them, his *Examen* of Pope's *Essay on Man* and his *Commentaire* on the same poem, have some interest for English readers An English translation of the *Examen* by Mrs Elizabeth Carter was published in 1739, and led to the intervention of Warburton, who considered it necessary to prove that the *Essay* was not in any way hostile to religion.

During the second half of the 18th century all Europe

Rousseau.

was reading the works of a Swiss writer, by far the most illustrious man of letters whom Switzerland has produced —J J Rousseau He moved civilized mankind by many a doctrine which no one now holds to be true, but he owed his astonishing influence not so much to his fallacies as to his passionate zeal for the rights of the poor, to his enthusiasm for the free development of individual character, and to the power with which he reflected in his writings the beauty and the splendour of the external world Of his own happiness he made shipwreck, but, if we judge his work simply by the practical results which sprang from it, he was perhaps the greatest literary force of modern times His family was of French origin, but it had been so long settled at Geneva that it had become thoroughly Swiss, and to this fact were due some of the

most striking characteristics of his genius Free and republican Switzerland was the only Continental country whose institutions were favourable to the growth of the ideas with which Rousseau shook to its centre the political and social system of the 18th century

Saussure. Of the other French writers of Switzerland in this age the most eminent was perhaps H B de Saussure, who, in his *Voyages dans les Alpes* (1776–79), presented in a lucid and attractive style the results of much careful observation He was one of the founders of geology, and made important contributions to several other sciences Another distinguished scientific writer of this time was Charles Bonnet (Bonnet), the author of several valuable works on natural history and psychology His general conception of the order of the world he developed systematically in his *Contemplation de la Nature* (1764) Much good work was also done by the brothers De Luc (The De Lucs), one of whom, Jean-André de Luc, gave in *Lettres sur Quelques Parties de la Suisse* (1787) a very vivid picture of the physical, social, and political peculiarities of a portion of Switzerland

Some clever books were written by Madame de Charrière (Mme de Charrière), a native of Utrecht, who settled with her husband in the principality of Neuchâtel in 1771 Much interest was excited by her lively *Lettres Écrites de Lausanne* and by her *Lettres Neuchâteloises*, and both in Switzerland and in France there were many admirers of her *Mari Sentimental* and of the corresponding work *Lettres de Mistress Henley* Samuel Constant, the father of Benjamin Constant, wrote *Camille* and some other romances in the form of letters, and *Contes Moraux*, in the style of Marmontel, were written by J Senebier, who did better work as an investigator in physics and physiology

In the second half of the 18th century there were in French Switzerland many ardent students of history One of the ablest of them was P H Mallet (Mallet), who took as his special subject the antiquities of northern Europe, but wrote also works on the general history of Denmark, Brunswick, and Hesse Bérenger (Bérenger) was the author of a *Histoire de Genève*, and Lamberty (Lamberty), who had served as secretary of several legations in Holland and Germany, brought together in his *Mémoires* many interesting details about events of which he had personal knowledge A good history of Switzerland to the 17th century was written by De Watteville, and Philibert dealt with the same subject in a work entitled *Les Révolutions de la Haute-Allemagne*, in which he brought the story down to 1468 G E von Haller (Haller) wrote several excellent historical works, the most important of which was his *Bibliothek der Schweizergeschichte*.

From the latter part of the 18th century onwards French Switzerland has produced many influential writers, but they have been so intimately connected with France that their works properly belong to French literature Necker, who played so great a part in France before the Revolution, was one of the greatest writers of his age on politics and finance, and his daughter Madame de Stael, whom, although she was born in Paris, Switzerland may also claim, stands in the front rank of women who have devoted themselves to literature Her most brilliant work, *Corinne*, was perhaps of less real importance than *De l'Allemagne*, from which Frenchmen obtained for the first time authentic information as to the intellectual development of Germany Benjamin Constant (B Constant) wrote a work on the source, forms, and history of religion, he was also the author of *Adolphe*, a romance, and adapted Schiller's *Wallenstein* for the French stage. But his principal work is the collection of his *Discours Prononcés à la Chambre des Députés*, in which he eloquently defends, from many points of view, the principles of constitutional government. De Sismondi (Sismondi) displayed astonishing energy as a writer on history, literature, and political economy, and it is still necessary for students of the subjects on which he wrote to consult his works His *Histoire des Français*, although planned on too vast a scale, is a wonderful monument of industry, learning, and literary skill, and not less valuable in their own way are his *Histoire de la Renaissance de la Liberté en Italie* and his *De la Littérature du Midi de l'Europe* A Vinet (Vinet), an eminent Protestant theologian, produced a great impression by his *Discours sur Quelques Sujets Religieux* and various other theological works, which are full of vigorous thought expressed in a clear, direct, and manly style Among Swiss novelists R Topffer (Topffer), author of *L'Heritage, Traversée*, and many other works, takes a distinguished place His early writings attracted the attention of Goethe, who read them with pleasure, and Sainte-Beuve, in praising Topffer's methods, gave utterance to the general opinion of educated Frenchmen The three brothers Andre, Antoine Elisée, and Joel Cherbuliez (The Cherbuliez), and their sisters Adrienne and Madame Tourte-Cherbuliez, were all well known writers, and Victor Cherbuliez, the son of André, is one of the brightest and most fertile novelists of the present day in France He commands respect also as a writer on politics

In the later literature of the German cantons there are not so many famous names as in the later literature of the French cantons Of a group of writers who connected the influences of the 18th century with those of the 19th, J B Albertini (Albertini) was the most original, but he appealed to a comparatively small class He was a bishop in the church of the Moravian Brethren, and his poems give powerful expression to the deeply religious sentiment of his sect A romance by J C Appenzeller (Appenzeller)—*Gertrud von Wart* (1813)—was so popular that it was translated into French, Dutch, and English, but it has not maintained the high place which was for some time attributed to it J R Wyss (Wyss) edited the *Alpenrosen* from 1811 for about twenty years, and for this periodical he wrote many poems, taking his subjects chiefly from Swiss history and legends He completed and published a story begun by his father, *Der Schweizerische Robinson*, translations of which have been widely circulated in France, Spain, England, and America He also wrote "Rufst du, mein Vaterland," the great national song of Switzerland A E Frohlich (Frohlich) was a good writer of fables, and J A Henne (Henne) made a considerable reputation, not only as a poet but as the writer of a work entitled *Manethos, die Origines unserer Geschichte und Chronologie*, in which he sought to prove the European origin of the Aryan race T Meyer-Merian (Meyer-Merian), author of the well-known song, "Ich ging so ganz alleine," was also a vigorous dramatist Dramatic and lyrical poems of some power were written by T Bornhauser (Bornhauser), but they were too plainly intended to serve a political party to have permanent significance A more poetical writer was B Reber (Reber), whose *Bilder aus den Burgunder-Kriegen* present a series of glowing pictures from one of the most splendid periods of Swiss history

All these writers were surpassed by Albert Bitzius (Bitzius), known as Jeremias Gotthelf from the title of his first book He was the vicar of Lutzelfluh, and for many years found ample scope for his energies in quiet works of benevolence *Der Bauernspiegel, oder Lebensgeschichte des Jeremias Gotthelf*, published in 1836, when he was nearly forty years of age, at once made his name famous, and it was followed by *Uli der Knecht, Uli der Pachter, Leiden und Freuden eines Schulmeisters*, and other powerful tales The charm of his writings springs from the fact that they are an accurate representation of the thoughts, feelings, and habits of the people among whom he laboured Bitzius was a man of an ardent and impulsive temper, but a close observer, capable of penetrating far below the

surface of life, and endowed with a remarkable faculty of reproducing his impressions in striking imaginative pictures His style is often rough and careless, but his artistic defects are never serious enough to interrupt the free development of his fresh and vivid conceptions

eller Another German writer of Switzerland whose name is well known beyond the limits of his own country is Gottfried Keller He established his reputation by his romance *Der Grune Heinrich* (1854), and afterwards he published *Die Leute von Seldwyla*, a series of tales of village life, and *Sieben Legenden* He is also the author of some volumes of poems

See E H Gaullieur, *Études sur l'Histoire Littéraire de la Suisse Française* (1856), J C Mörikofer, *Die schweizerische Literatur des achtzehnten Jahrhunderts* (1861), and R Weber, *Die poetische Nationalliteratur der deutschen Schweiz* (1866–67) (J SI)

INDEX

SWORD *Origins and Early Forms* —The sword is a hand-weapon of metal, distinct from all missile weapons on the one hand, and on the other hand from staff-weapons, —the pike, bill, halberd, and the like,—in which the metal head or blade occupies only a fraction of the effective length The handle of a sword provides a grip for the hand that wields it, or sometimes for two hands, it may add protection, and in most patterns does so to a greater or less extent But it is altogether subordinate to the blade For want of a metal-headed lance or axe, which indeed were of later invention, a sharpened pole or a thin-edged paddle will serve the turn A sword-handle without a blade is naught, and no true sword-blade can be made save of metal capable of taking an edge There are so-called swords of wood and even stone to be found in collections of savage weapons But these are really flattened clubs, and the present writer agrees with Gen Pitt-Rivers in not believing that such modifications of the club have had any appreciable influence on the form or use of true swords On this last point, however, the opinions of competent archæologists are so much divided that it must be regarded as fairly open We will only remark that the occurrence in objects of human handiwork of a form, or even a series of forms, intermediate between two types is not conclusive evidence that those forms are historical links between the different types, or that there is any historical connexion at all In the absence of dates fixed by external evidence this kind of comparison will seldom take us beyond plausible conjecture A traveller who had never seen velocipedes might naturally suppose, on a first inspection, that the tricycle was a modification of the old four-wheeled velocipede, and the bicycle a still later invention, he would perhaps regard the two wheeled "Otto" as the historical link between tricycles and bicycles But we know that in fact the order of development has been quite different

It is more difficult as a matter of verbal definition to distinguish the sword from smaller hand-weapons Thus an ordinary sword is four or five times as long as an ordinary dagger · but there are long daggers and short swords, neither will the form of blade or handle afford any certain test The real difference lies in the intended use of the weapon, we associate the sword with open combat, the dagger with a secret attack or the sudden defence opposed to it. One might say that a weapon too large to be concealed about the person cannot be called a dagger Again, there are large knives, such as those used by the Afridis and Afghans, which can be distinguished from swords only by the greater breadth of the blade as compared with its length Again, there are special types of arms, of which the yataghan is a good example, which in their usual forms do not look much like swords, but in others that occur must be classed as varieties of the sword, unless we keep them separate by a more or less artificial theory, referring the type as a whole to a different origin

Of the actual origin of swords we have no direct evidence. Neither does the English word nor, so far as

we are aware, any of the equivalent words in other languages, Aryan or otherwise, throw any light on the matter We only know that swords are found from the earliest times of which we have any record among all people who have acquired any skill in metal-work There are two very ancient types, which we may call the straight-edged and the leaf-shaped Assyrian monuments represent a straight and narrow sword, apparently better fitted for thrusting than cutting Bronze swords of this form have actually been found in Etruscan tombs, and by Dr Schliemann at Mycenæ, side by side with leaf-shaped specimens We have also from Mycenæ some very curious and elaborately wrought blades, so broad and short that they must be called ornamental daggers rather than swords The leaf-shaped blade is common everywhere among the remains of men in the "Bronze Period" of civilization, and

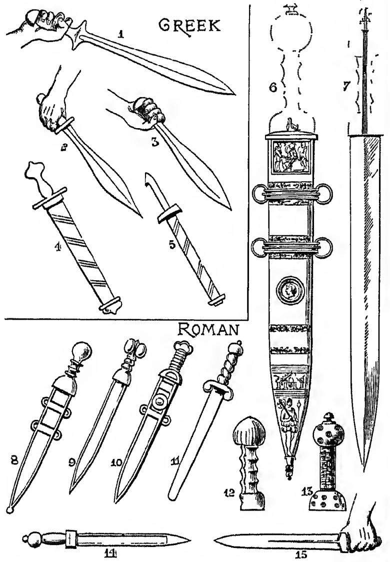

FIG 1—1-5, Greek swords of the classical type (Gerhard's *Griechische Vasenbilder*) 6-15, Roman swords from Lindenschmit, *Tracht und Bewaffnung des römischen Heeres während der Kaiserzeit*, Brunswick, 1882 6, So-called "sword of Tiberius" from Mainz (Brit Mus), 7, Bonn (private collection), length 765 mm, 8, legionary (monument at Wiesbaden), 9, cavalry (monument at Mainz), 10, cavalry (monument at Worms), 12, 13, sword handles (Kiel and Mainz), 11, 14, 15, from Trajan's column

this was the shape used by the Greeks in historical times, and is the shape familiar to us in Greek works of art It is impossible, however, to say whether the Homeric heroes wore the leaf-shaped sword, as we see it, for example, on the Mausoleum sculptures, or a narrow straight-edged blade of the Assyrian-Mycenæan pattern In any case, the sword holds a quite inferior position with Greek warriors of all times We have not the means of pronouncing which pattern is the older To a modern eye the Assyrian or Mycenæan sword looks fitter for thrusting than cutting The leaf-shaped sword, so far as we know from works of art, was used with a downright cutting blow, regardless of the consequent exposure of the swordsman's body, this, however, matters little when defence is left to a shield or armour, or both The use of the sword as a weapon of combined offence and defence—swordsmanship as we now understand it—is quite modern If the sword was developed from a spearhead or dagger, one would expect it to have been a thrusting weapon before it was a cutting one But when we come to historical times we find that the effective use of the point is a mark of advanced skill and superior civilization The Romans paid special attention to it, and Tacitus tells us how Agricola's legionaries made short work of the clumsy and pointless arms of the Britons when battle was fairly joined [1] The tradition was preserved at least as late as the time of Vegetius, who, as a technical writer, gives details of the Roman soldier's sword exercise Asiatics to this day treat the sword merely as a cutting weapon, and most Asiatic swords are incapable of being handled in any other way

Historical Types—The normal types of swords which we meet with in historical times, and from which all forms now in use among civilized nations are derived, may be broadly classified as straight-edged or curved In the straight-edged type, in itself a very ancient one, either thrusting or cutting qualities may predominate, and the blade may be double-edged or single-edged The double-edged form was prevalent in Europe down to the 17th century The single-edged blade, or backsword as it was called in England, is well exemplified in the Scottish weapons commonly but improperly known as claymores, and is now exclusively employed for military weapons But these, with few exceptions, have been more or less influenced by the curved Oriental sabre Among early double-edged swords the Roman pattern stands out as a workmanlike and formidable weapon for close fight, the point was used by preference In the Middle Ages the Roman tradition disappeared, and a new start was made from the clumsy barbarian arm which the Romans had despised Gradually the broad and all but pointless blade was lightened and tapered, and the thrust, although its real power was unknown, was more or less practised St Louis anticipated Napoleon in calling on his men to use the point, and the heroes of dismounted combats in the *Morte Darthur* are described as "foining" at one another In the first half of the 16th century a well-proportioned and well-mounted cut-and-thrust sword was in general use, and great artistic ingenuity was expended, for those who could afford it, on the mounting and adornment The growth and variations of the different parts of the hilt, curiously resembling those of a living species, would alone be matter enough for an archæological study One peculiar form, that of the Scottish basket-hilt, derived from the Venetian pattern known as *schiavone*, has persisted to our own day without material change

Quite different from the European models is the crescent-shaped Asiatic sabre, commonly called scimitar We are not acquainted with any distinct evidence as to the origin of this in time or place The fame of the Damascus manufacture of sword-blades is of great antiquity, as is also that of Khorásán, still the centre of the best Eastern work of this kind Whoever first made these blades had conceived a very definite idea,—that of gaining a maximum of cutting power regardless of loss in other qualities,—and executed it in a manner not to be improved upon The action of the curved edge in delivering a blow is to present an oblique and therefore highly acute-angled section of the blade to the object struck, so that in effect the cut is given with a finer edge than could safely be put on the blade in its direct transverse section In a well-made sabre the setting of the blade with regard to the handle ("leading forward") is likewise ordered with a view to this result And the cutting power of a weapon so shaped and mounted is undoubtedly very great But

[1] *Agric*, 36 "Britannorum gladii sine mucrone complexum armorum et in aperto pugnam non tolerabant"

the use of the point is abandoned, and the capacities of defensive use (to which Orientals pay little or no attention) much diminished These drawbacks have caused the scimitar type, after being in fashion for European light cavalry during the period of Napoleon's wars and somewhat longer, to be discarded in our own time But, as long as Easterns adhere to their rigid grasp of a small handle and sweeping cut delivered from the shoulder, the Persian scimitar or Indian talwár will remain the natural weapon of the Eastern horseman Indian and Persian swords are often richly adorned, but their appropriate beauty is in the texture of the steel itself, the "damascening" or "watering" which distinguishes a superior from a

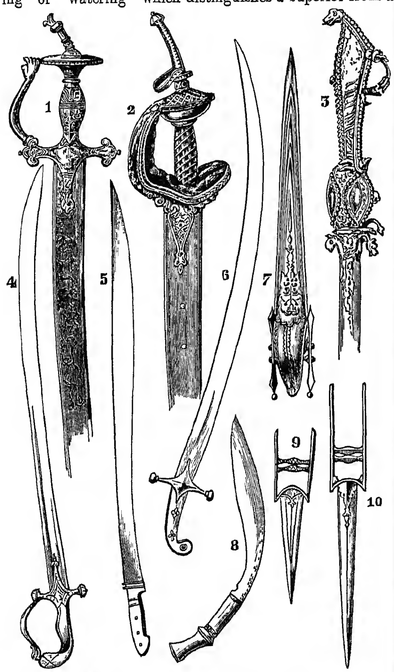

FIG 2—Oriental swords (reproduced by permission from Egerton's *Illustrated Handbook of Indian Arms*, published by the India Office, 1880) 1, 2 Decorated Persian arms, 3, gauntlet sword, 4, common type of talwár (North West Provinces), 5, yataghan type, 6, Persian talwár, 8, kukri (Nepal), 7, 9, 10, Mahratta, showing transition to gauntlet sword

common specimen This process, long obscure to Europeans, has in recent times been explained (see below).

There are special Asiatic varieties of curved blades of which the origin is more or less uncertain Among these the most remarkable is perhaps the yataghan, a weapon pretty much coextensive with the Mohammedan world, though it is reported to be not common in Persia It has been imported from Africa, through a French imitation, as the model of the sword-bayonets which have been common for about a generation in European armies; probably the French authorities caught at it to satisfy the sentiment, which lingered in Continental armies long after it had disappeared in England, that even the infantry soldier after the invention of the bayonet must have some kind of sword A compact and formidable hand-weapon has thus been turned into a clumsy and top-heavy pike If we try to make a bayonet that will cut cabbages, we may or may not get a useful chopper, but we shall certainly get a very bad bayonet The double curve of the yataghan is substantially identical with that of the Goorkha knife (*kukri*), though the latter is so much broader as to be more like a woodman's than a soldier's instrument It is doubtful, however, whether there is any historical connexion Similar needs are often capable of giving rise to similar inventions without imitation or communication There are yet other varieties, belonging to widely spread families of weapons, which have acquired a strong individuality Such are the swords of Japan, which are the highly perfected working out of a general Indo-Chinese type, they are powerful weapons and often beautifully made, but a European swordsman would find them ill-balanced and clumsy, and the Japanese style of sword-play certainly has nothing to teach us

Other sorts of weapons, again, are so peculiar in form or historical derivation, or both, as to refuse to be referred to any of the normal divisions The long straight gauntlet-hilted sword (*patá*) found both among the Mahrattas in the south of India, and among the Sikhs and Rajputs in the north, is an elongated form of the broad-bladed dagger with a cross bar handle (*katár*), as is shown by a transitional form, much resembling in shape and size of blade the mediæval English anlace, and furnished with a guard for the back of the hand This last-mentioned pattern seems, however, to be limited to a comparatively small region When once the combination of a long blade with the gauntlet hilt was arrived at, any straight blade might be so mounted, and many appear on examination to be of European workmanship—German, Spanish, or Italian There are various other Oriental arms, notably in the Malay group, as to which it is not easy to say whether they are properly swords or not. The Malay "parang latok" is a kind of elongated chopper sharpened by being bevelled off to an edge on one side, and thus capable of cutting only in one direction The anlace incidentally mentioned above seems to be merely an overgrown dagger, the name occurs only in English and Welsh, in which language first, or whence the name or thing came, is unknown (see *Philol Soc Dict*, *s v*)

Modern European Developments—In the course of the 16th century the straight two-edged sword of all work was lengthened, narrowed, and more finely pointed, till it became the Italian and Spanish rapier, a weapon still furnished with cutting edges, but used chiefly for thrusting We cannot say how far this transition was influenced by the *estoc*, a mediæval thrusting weapon carried by horsemen rather as an auxiliary lance than as a sword The Roman preference of the point was rediscovered under new conditions, and fencing became an art Its progress was from pedantic complication to lucidity and simplicity, and the fashion of the weapon was simplified also Early in the 18th century, the use of the edge having been finally abandoned in rapier-play, the two-edged blade was supplanted by the bayonet-shaped French duelling sword, on which no improvement has since been made except in giving it a still simpler guard The name of rapier is often but wrongly given to this by English writers About the same time, or a little earlier, the primacy of the art passed from Italy to France, and there it still remains It would take us too far to consider the history of fencing here, Mr Egerton Castle's work will be found a trustworthy guide, and almost indispensable for those who wish really to understand the passages relating to sword-play in our Elizabethan literature, of which the fencing scene in *Hamlet* is the most famous and obvious example

Meanwhile a stouter and broader pattern, with sundry minor varieties, continued in use for military purposes, and gradually the single-edged form or broadsword prevailed The well-known name of Ferara, peculiarly associated with Scottish blades, appears to have originally belonged to a Venetian maker, or family of makers, towards the end of the 16th century The Spanish blades made at Toledo had by that time acquired a renown which still continues Somewhat later Oriental example, imported probably by way of Hungary, induced the curvature found in most recent military sabres, which, however, is now kept within

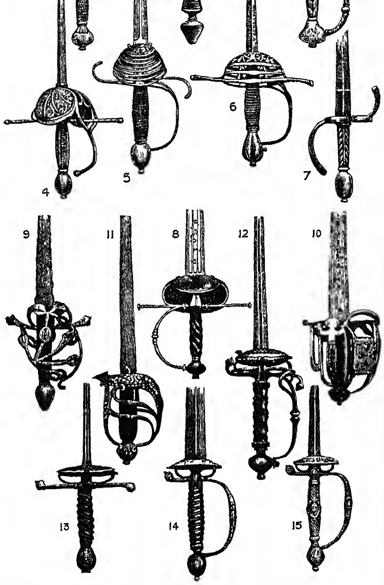

FIG 3 —Typical European swords, 16th–18th centuries Reproduced by permission from Mr Egerton Castle's *Schools and Masters of Fence* 1, Early 16th cent, 2, German, *c* 1550, 3, Italian rapier, third quarter 16th cent, 4, Spanish rapier, late 16th cent, 5, Italian, same period, 6, English, same period, 7, English musketeer's sword, early 17th cent, 8, Spanish broadsword, early 17th cent, 9, Venetian, *c* 1550, 10, Italian, late 16th cent, 11, English, time of Commonwealth, 12, French rapier, *c* 1650, 13, German flamberg, early 17th cent, 14, 15, small swords, 1700–1750

such bounds as not to interfere with the effective use of the point An eccentric specialized variety—we may call it a "sport"—of the sabre is the narrow and flexible "schlager" with which German students fight their duels (for the most part not arising out of any quarrel, but set trials of skill), under highly conventional rules almost identical with those of the old English "backswording" practised within living memory, in which, however, the swords were represented by sticks These "schlager" duels cause much effusion of blood, but not often serious danger to life or limb.

There are plenty of modern books on sabre-play, but comparatively little attention has been given to its scientific treatment It is said that the Italian school is better than the French, and the modern German and Austrian the best of all Some of the English cavalry regiments have good traditions, enriched of late years by the application of a knowledge of fencing derived from eminent French masters

The Manufacture of Swords —Mechanical invention has not been able to supersede or equal hand-work in the production of good sword blades The swordsmith's craft is still, no less than it was in the Middle Ages, essentially a handicraft, and it requires a high order of skill His rough material is a bar of cast and hammered steel tapering from the centre to the ends, when this is cut in two, each half is made into a sword The "tang" which fits into the handle is not part of the blade, but a piece of wrought iron welded on to its base From this first stage to the finishing of the point it is all hammer-and anvil work Special tools are used to form grooves in the blade according to the regulation or other pattern desired, but the shape and weight of the blade are fixed wholly by the skilled hand and eye of the smith Measuring tools are at hand, but are little used Great care is necessary to avoid overheating the metal, which would produce a brittle crystalline grain, and to keep the surface free from oxide, which would be injurious if hammered in In tempering the blade the workman judges of the proper heat by the colour Water is preferred to oil by the best makers, notwithstanding that tempering in oil is much easier With oil there is not the same risk of the blade coming out distorted and having to be forged straight again (a risk, however, which the expert swordsmith can generally avoid), but the steel is only surface hardened, and the blade therefore remains liable to bend Machinery comes into play only for grinding and polishing, and to some extent in the manufacture of hilts and appurtenances The finished blade is proved by being caused to strike a violent blow on a solid block with the two sides flat, with the edge, and lastly with the back, after this the blade is bent flatwise in both directions by hand, and finally the point is driven through a steel plate about an eighth of an inch thick In spite of all the care that can be used both in choice of material and in workmanship, about 40 per cent of the blades thus tried fail to stand the proof, and are rejected The process we have briefly described is that of making a really good sword, of course plenty of cheaper and commoner weapons are in the market, but they are hardly fit to trust a man's life to It is an interesting fact that the peculiar skill of the swordsmith is in England so far hereditary that it can be traced back in the same families for several generations

The best Eastern blades are justly celebrated, but they are not better than the best European ones, in fact, European swords are often met with in Asiatic hands, remounted in Eastern fashion The "damascening" or "watering" of choice Persian and Indian arms is not a secret of workmanship, but is due to the peculiar manner of making the Indian steel itself, in which a crystallizing process is set up, when metal of this texture is forged out, the result is a more or less regular wavy pattern running through it No difference is made by this in the practical qualities of the blade

The following list of works is intended to guide the reader, if desired, to fuller acquaintance with the literature and authorities of the subject, and will, it is hoped, be found useful for that purpose, but it does not profess to be in itself sufficient even as a selection

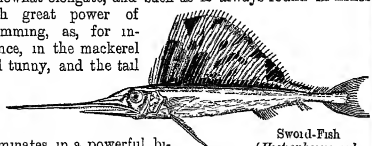
Archaeology and General History —R F Burton, *The Book of the Sword* (only one vol published), London, 1884, Colonel Lane Fox (now Major Gen Pitt Rivers), *Catalogue of Anthropological Collection, South Kensington Museum*, London, 1874, "Primitive Warfare," in *Journal* of the Royal United Service Institution, 1867, 1868, 1869 For special regions and periods, see Hon Wilbraham Egerton, *Illustrated Handbook of Indian Arms*, published by the India Office, London, 1880, Lindenschmit, *Tracht und Bewaffnung des römischen Heeres während der Kaiserzeit*, Brunswick, 1882, Drummond and Anderson, *Ancient Scottish Weapons*, Edinburgh and London, 1881 The more general treatises and handbooks on arms and armour, such as Grose, Meyrick, Hewitt, Lacombe, Demmin, may be consulted with advantage, but are not always to be trusted in details "The Forms and History of the Sword," in *Proceedings* of the Royal Institution, 1883, by the present writer, gives further references and citations on various points

Swordsmanship —Egerton Castle, *Schools and Masters of Fence from the Middle Ages to the Eighteenth Century*, London, 1885 (including a critical bibliography), Vigeant, *Bibliographie de l'Escrime Ancienne et Moderne*, Paris, 1882, Gomard (assumed name of Possellier), *Théorie de l'Escrime*, Paris, 1845 (historical introduction), Grisier, *Les Armes et le Duel*, Paris, 1847 (preface by A Dumas) Chapman, *Foil Practice*, London, 1861, *Notes and Observations on the Art of Fencing*, 1864, J M Waite, *Lessons in Sabre, &c*, London, [1881] The French official *Manuel d'Escrime* (approved 1877) gives a very clear and concise summary of the modern school Cordelois's *Leçons d'Armes* (Paris, 1872, 2d ed) and Camille Prévost's *Théorie Pratique de l'Escrime* (Paris, 1886) are the latest and best treatises on the small-sword There is forthcoming in England, in the "Badminton Series," a work on *Fencing* by W H Pollock and F Craufurd Grove, to which is added *Bibliotheca Artis Dimicatoriæ, a Complete and General Bibliography of the Art of Fence*, by Egerton Castle

Technology —Wilkinson, *Engines of War*, London, 1841, Latham, "The Shape of Sword-Blades," *Journal* of the Royal U S Institution, 1862, Marey, *Memoire sur les Armes Blanches*, Strasburg, 1841, transl by Lieut Col Maxwell, London, 1860 (F PO)

SWORD-FISH. Sword-fishes are a small family of spiny-rayed fishes (*Xiphiidæ*), the principal characteristic of which consists in the prolongation of the upper jaw into a long pointed sword-like weapon. The "sword" is formed by the coalescence of the intermaxillary and maxillary bones, which possess an extremely hard texture; it has the shape of a much elongate cone, more or less flattened throughout its whole length; the end is sharply pointed. It is smooth above and on the upper part of the sides, and rough below owing to the presence of innumerable rudimentary teeth, which have no function.

The general form of the body is well proportioned, somewhat elongate, and such as is always found in fishes with great power of swimming, as, for instance, in the mackerel and tunny, and the tail terminates in a powerful bilobed caudal fin. A long fin occupies nearly the whole length of the back, whilst the anal fin is generally interrupted in the middle, and consequently appears to be double. The skin is very firm, partly naked, partly with small lanceolate scales deeply imbedded in the skin. The teeth of the lower jaw are, like those of the upper, merely rudimentary structures, which render the surface of the bone rough without possessing any special function.



Sword-Fish (*Histiophorus pulchellus*)

Sword fishes have been divided into three generic groups:—

a *Histiophorus*, with a high dorsal fin which can be spread out like a sail, and with ventral fins which are reduced to a pair of long styliform appendages.
b *Tetrapturus*, with a dorsal fin of which the anterior rays only are elongate, the remainder of the fin being low or partly obsolete, and with styliform ventral fins as in the preceding genus.
c *Xiphias*, with the dorsal fin shaped as in *Tetrapturus*, but without ventral fins.

Sword-fishes are truly pelagic fishes, which either singly or in pairs or in smaller or larger companies roam over the oceans of the tropical and subtropical zones of both hemispheres. Some species wander regularly or stray far into the temperate seas. Some of the tropical forms are the largest of Acanthopterygian fishes, and not exceeded in size by any other Teleostean; such species attain to a length of from 12 to 15 feet, and swords have been preserved more than 3 feet long and with a diameter of at least 3 inches at the base. The *Histiophori*, which inhabit chiefly the Indo-Pacific Ocean, but occur also in the Atlantic, seem to possess in their high dorsal fin an additional aid for locomotion. During the rapid movements of the fish this fin is folded downwards on the back, as it would impede the velocity of progress by the resistance it offers to the water; but, when the fish is swimming in a leisurely way, it is frequently seen with the fin erected and projecting out of the water, and when quietly floating on the surface it can sail by the aid of the fin before the wind, like a boat.

The food of the sword-fishes is the same as that of tunnies, and consists of smaller fish, and probably also in great measure of pelagic cuttle fishes. It has been ascertained by actual observation that sword-fishes procure their food by dashing into a school of fishes, piercing and killing a number of them with their swords; and this kind of weapon would seem to be also particularly serviceable in killing large cuttle-fish, like the saw of saw-fishes, which is used for the same purpose. But the swords of the large species of *Histiophorus* and *Tetrapturus* are, besides, most formidable weapons of aggression. These fishes never hesitate to attack whales and other large cetaceans, and, by repeatedly stabbing them, generally retire from the combat victorious. That they combine in these attacks with the thresher-shark is an often repeated story which has its foundation in the imagination of the observer, and which is fully disproved by the fact that the dentition of the thresher-shark is much too weak to make an impression on the skin of any cetacean. The cause which excites sword-fishes to such attacks is unknown; but they follow the instinct so blindly that they not rarely assail boats and ships in a similar manner, evidently mistaking them for cetaceans. They easily pierce the light canoes of the natives of the Pacific islands and the heavier boats of the professional sword-fish fishermen, often dangerously wounding the persons sitting in them. Attacks by sword-fishes on ocean-going ships are so common as to be included among sea risks; they are known to have driven their weapon through copper-sheathing, oak-plank, and timber to a depth of nearly 10 inches, part of the sword projecting into the inside of the ship; and the force required to produce such an effect has been described by Prof. Owen in a court of law as equal to "the accumulated force of fifteen double-handed hammers," and the velocity as "equal to that of a swivel-shot," and "as dangerous in its effects as a heavy artillery projectile." Among the specimens of planking pierced by sword-fishes which are preserved in the British Museum there is one less than a foot square which encloses the broken ends of three swords, as if the fishes had had the object of concentrating their attack on the same vulnerable point of their supposed enemy. The part of the sword which penetrates a ship's side is almost always broken off and remains in the wood, as the fish is unable to execute sufficiently powerful backward movements to free itself by extracting the sword.

In the Mediterranean and on the Atlantic coasts of the United States the capture of sword-fishes forms a regular branch of the fishing industry. The object of the fishery in the Mediterranean is the common European sword-fish (*Xiphias gladius*), the average weight of which is about one cwt., and which is abundant off the Sicilian coasts and on the opposite coast of Calabria. Two methods are employed,—that by harpoons, chiefly used for larger fish, and that by peculiarly constructed nets called *palamitare*. This fishery is very productive; a company of fishermen frequently capture from twenty to fifty fish in a single day, and the average annual catch in Sicily and Calabria is reported to be 140,000 kilogrammes (138 tons). The products of the fishery are consumed principally in a fresh state, but a portion is preserved in salt or oil. The flesh of the sword-fish is much preferred to that of the tunny, and always commands a high price. This species is occasionally captured on the British coast.

On the coast of the United States a different species, *Histiophorus gladius*, occurs; it is a larger fish than the Mediterranean sword-fish, attaining to a length of from 7 to 12 feet, and an average weight of 300 or 400 lb. It is captured only by the use of the harpoon. From forty to fifty vessels, schooners of some 50 tons, are annually engaged in this fishery, with an aggregate catch amounting annually to about 3400 sword-fishes, of a value of $45,000. The flesh of this species is inferior in flavour to that of the Mediterranean species, and is principally consumed after having been preserved in salt or brine.

Useful and detailed information on the sword-fish fishery can be obtained from A. T. Tozzetti, "La Pesca nei Mari d'Italia e la Pesca all' Estero esercitata da Italiani," in *Catalogo Esposizione Internazionale di Pesca in Berlino*, 1880, also from *La Pesca del Pesce Spada nello Stretto di Messina* (Messina, 1880), and from G. Brown Goode, "Materials for a History of the Sword-fish," in *Report of the Commissioner of Fish and Fisheries*, part viii., Washington, 1883. (A. C. G.)

SYBARIS, a city of Magna Græcia, on the Gulf of Tarentum, between the rivers Crathis (Crati) and Sybaris (Coscile), which now meet 3 miles from the sea, but anciently had independent mouths, was the oldest Greek colony in this region. It was an Achæan colony founded by Isus of Helice (720 B.C.), but had among its settlers many Trœzenians, who were ultimately expelled. Placed in a very fertile, though now most unhealthy, region, and following a liberal policy in the admission of citizens from all quarters, the city became great and opulent, with a vast subject territory and divers daughter colonies even on the Tyrrhenian Sea (Posidonia, Laus, Scidrus). For magnificence and luxury the Sybarites were proverbial throughout Greece, and in the 6th century probably no Hellenic city could compare with its wealth and splendour. At length contests between the democrats and oligarchs, in which many of the latter were expelled and took refuge at Crotona, led to a war with that city, and the Crotoniats with very inferior forces were completely victorious. They razed Sybaris to the ground and turned the waters of Crathis to flow over its ruins (510 B.C.). Explorations undertaken by the Italian Government in 1879 have failed to lead to a precise knowledge of the site.

SYCAMORE. See FIG, vol. ix. p. 154, and MAPLE, vol. xv. p. 524.

SYDENHAM, a suburb of London, in the county of Kent, is finely situated chiefly on elevated ground about 7 miles south of Charing Cross, London. There is railway communication by the London, Brighton, and South Coast, the Mid Kent branch of the South-Eastern, and the London, Chatham, and Dover lines. Formerly Sydenham was a small hamlet of Lewisham, which rose into favour from its sylvan beauty, its pleasant situation, and its medicinal waters. These springs were discovered in 1640 on Sydenham common. The quality of the water resembled that of Epsom, and was regarded as efficacious in scorbutic and paralytic affections. After the construction of a railway the suburb grew into high repute as a residence, especially for the wealthier commercial and professional classes. The construction of the Crystal Palace (see LONDON, vol. xiv. p. 836) in 1854 greatly aided the prosperity of Sydenham, although the building is not within its boundaries. There is a public lecture hall and literary institute at Sydenham Hill, and a school of art, science, and literature in connexion with the Crystal Palace. The charitable institutions include a home and infirmary for sick children and the South London dispensary for women. The population of the township (area, 1623 acres) was 19,065 in 1871, and 26,076 in 1881.

SYDENHAM, THOMAS (1624-1689), "the English Hippocrates," was born at Winford Eagle in Dorset in 1624, where his father was a gentleman of property and good pedigree. At the age of eighteen he was entered at Magdalen Hall, Oxford; after two years his college studies appear to have been interrupted, and he served for a time as an officer in the army of the Parliament. He completed his Oxford course in 1648, graduating as bachelor of medicine, and about the same time he was elected a fellow of All Souls College. It was not until nearly thirty years later (1676) that he graduated as M.D., not at Oxford, but at Pembroke Hall, Cambridge, where his eldest son was then an undergraduate. His interest in medicine seems to have been aroused at an early age. Nothing is known of Sydenham's life between 1648 and 1663; but it is probable that he spent part of the time at Oxford. It is said also (on the authority of one Desault, in a work published at Bordeaux in 1733) that he studied at Montpellier, although it is not so stated by himself in his dedicatory letter to Dr Mapletoft, among the other autobiographical facts there given. In 1663 he passed the examinations of the College of Physicians for their licence to practise in Westminster and 6 miles round; but it is probable that he had been settled in London for some time before that. This minimum qualification to practise was the single bond between Sydenham and the College of Physicians throughout the whole of his career. He seems to have been distrusted by the heads of the faculty because he was an innovator and something of a plain-dealer. In his letter to Mapletoft he refers to a class of detractors "qui vitio statim vertunt si quis novi aliquid, ab illis non prius dictum vel etiam inauditum, in medium proferat"; and in a letter to Robert Boyle, written the year before his death (and the only authentic specimen of his English composition that remains), he says, "I have the happiness of curing my patients, at least of having it said concerning me that few miscarry under me; but [I] cannot brag of my correspondency with some other of my faculty. . . . Though yet, in taking fire at my attempts to reduce practice to a greater easiness, plainness, and in the meantime letting the mountebank at Charing Cross pass unrailed at, they contradict themselves, and would make the world believe I may prove more considerable than they would have me." Sydenham attracted to him in warm friendship some of the most discriminating men of his time, such as John Locke and Robert Boyle. His first book, *Methodus Curandi Febres*, was published in 1666; a second edition, with an additional chapter on the plague, in 1668; and a third edition, much enlarged and bearing the better-known title of *Observationes Medicæ*, in 1676. His next publication was in 1680 in the form of two *Epistolæ Responsoriæ*, the one, "On Epidemics," addressed to Brady, regius professor of physic at Cambridge, and the other, "On the Lues Venerea," to Paman, public orator at Cambridge and Gresham professor in London. In 1682 he issued another *Dissertatio Epistolaris*, on the treatment of confluent smallpox and on hysteria, addressed to Dr Cole of Worcester. The *Tractatus de Podagra et Hydrope* came out in 1683, and the *Schedula Monitoria de Novæ Febris Ingressu* in 1686. His last completed work, *Processus Integri*, is an outline sketch of pathology and practice; twenty copies of it were printed in 1692, and, being a compendium, it has been more often republished both at home and abroad than any other of his writings separately. A fragment on pulmonary consumption was found among his papers. His collected writings occupy about 600 pages 8vo in the original Latin.

Hardly anything is known of Sydenham's personal history in London. He died in an acute paroxysm of gout in December 1689. He was buried in the church of St James's, Piccadilly, where a mural slab was put up by the College of Physicians in 1810.

Although Sydenham was a highly successful practitioner and saw more than one new edition of his various tractates called for, besides foreign reprints, in his lifetime, his fame as the father of English medicine, or the English Hippocrates, was decidedly posthumous. For a long time he was held in vague esteem for the success of his cooling (or rather expectant) treatment of smallpox, for his laudanum (the first form of a tincture of opium), and for his advocacy of the use of Peruvian bark in quartan agues. There were, however, those among his contemporaries who understood something of Sydenham's importance in larger matters than details of treatment and pharmacy, chief among them being the talented Morton. But the attitude of the academical medicine of the day is doubtless shown forth in Lister's use of the term "sectaries" for Sydenham and his admirers, at a time (1694) when the leader had been dead five years. If there were any doubt that the opposition to him was quite other than political, it would be set at rest by the testimony of Dr Andrew Brown,[1] who went from Scotland to inquire into Sydenham's practice, and has incidentally revealed

[1] See Dr John Brown's *Horæ Subsecivæ*, art. "Dr Andrew Brown and Sydenham."

what was commonly thought of it at the time, in his *Vindicatory Schedule concerning the New Cure of Fevers* In the series of Harveian orations at the College of Physicians, Sydenham is first mentioned in the oration of Arbuthnot (1727), who styles him "æmulus Hippocratis" Boerhaave, the Leyden professor, was wont to speak of him in his class (which had always some pupils from England and Scotland) as "Angliæ lumen, artis Phœbum, veram Hippocratici viri speciem" Haller also marked one of the epochs in his scheme of medical progress with the name of Sydenham He is indeed famous because he inaugurated a new method and a better ethics of practice, the worth and diffusive influence of which did not become obvious (except to those who were on the same line with himself, such as Morton) until a good many years afterwards It remains to consider briefly what his innovations were

First and foremost he did the best he could for his patients, and made as little as possible of the mysteries and traditional dogmas of the craft All the stories told of him are characteristic Called to a gentleman who had been subjected to the lowering treatment, and finding him in a pitiful state of hysterical upset, he "conceived that this was occasioned partly by his long illness, partly by the previous evacuations, and partly by emptiness I therefore ordered him a roast chicken and a pint of canary" A gentleman of fortune who was a victim to hypochondria was at length told by Sydenham that he could do no more for him, but that there was living at Inverness a certain Dr Robertson who had great skill in cases like his, the patient journeyed to Inverness full of hope, and, finding no doctor of the name there, came back to London full of rage, but cured withal of his complaint Of a piece with this is his famous advice to Blackmore When Blackmore first engaged in the study of physic he inquired of Dr Sydenham what authors he should read, and was directed by that physician to *Don Quixote*, "which," said he, "is a very good book, I read it still" There were cases, he tells us, in his practice where "I have consulted my patient's safety and my own reputation most effectually by doing nothing at all" It was in the treatment of smallpox that his startling innovations in that direction made most stir It would be a mistake, however, to suppose that Sydenham wrote no long prescriptions, after the fashion of the time, or was entirely free from theoretical bias Doctrines of disease he had, as every practitioner must have, but he was too much alive to the multiplicity of new facts and to the infinite variety of individual constitutions to aim at symmetry in his theoretical views or at consistency between his practice and his doctrines, and his treatment was what he found to answer best, whether it were *secundum artem* or not His fundamental idea was to take diseases as they presented themselves in nature and to draw up a complete picture ("krankheitsbild" of the Germans) of the objective characters of each Most forms of ill health, he insisted, had a definite type, comparable to the types of animal and vegetable species The conformity of type in the symptoms and course of a malady was due to the uniformity of the cause The causes that he dwelt upon were the "evident and conjunct causes," or, in other words, the morbid phenomena, the remote causes he thought it vain to seek after Acute diseases, such as fevers and inflammations, he regarded as a wholesome conservative effort or reaction of the organism to meet the blow of some injurious influence operating from without, in this he followed the Hippocratic teaching closely as well as the Hippocratic practice of watching and aiding the natural crises Chronic diseases, on the other hand, were a depraved state of the humours, mostly due to errors of diet and general manner of life, for which we ourselves were directly accountable Hence his famous dictum "*acutos* dico, qui ut plurimum Deum habent authorem, sicut chronici ipsos nos" Sydenham's nosological method is essentially the modern one, except that it wanted the morbid anatomy part, which was first introduced into the "natural history of disease" by Morgagni nearly a century later In both departments of nosology, the acute and the chronic, Sydenham contributed largely to the natural history by his own accurate observation and philosophical comparison of case with case and type with type The *Observationes Medicæ* and the first *Epistola Responsoria* contain evidence of a close study of the various fevers, fluxes, and other acute maladies of London over a series of years, their differences from year to year and from season to season, together with references to the prevailing weather,—the whole body of observations being used to illustrate the doctrine of the "epidemic constitution" of the year or season, which he considered to depend often upon inscrutable telluric causes The type of the acute disease varied, he found, according to the year and season, and the right treatment could not be adopted until the type was known There had been nothing quite like this in medical literature since the Hippocratic treatise, Περὶ ἀέρων, ὑδάτων, τόπων; and there are probably some germs of truth in it still undeveloped, although the modern science of epidemiology has introduced a whole new set of considerations Among other things Sydenham is credited with the first diagnosis of scarlatina and with the modern definition of chorea (in *Sched Monit*) After smallpox, the diseases to which he refers most are hysteria and gout, his description of the latter (from the symptoms in his own person) being one of the classical pieces of medical writing While Sydenham's "natural history" method has doubtless been the chief ground of his great posthumous fame, there can be no question that another reason for the admiration of posterity was that which is indicated by R G Latham, when he says, "I believe that the moral element of a liberal and candid spirit went hand in hand with the intellectual qualifications of observation, analysis, and comparison"

The most critical biography is that by Dr R G Latham prefixed to his translation of Sydenham's *Works* (2 vols, London, 1848, Syd Soc) Dr John Brown's "Locke and Sydenham," in *Horæ Subsecivæ*, Edinburgh, 1858, is more of the nature of eulogy Many collected editions of his works have been published, as well as three English translations Dr W A Greenhill's Latin text (London, 1844, Syd Soc) is a model of editing and indexing There have been foreign monographs on Sydenham by Goeden (Berlin, 1827), Rovers (Dort, 1838), F Jahn (Eisenach, 1840), and Hvasser (Upsala, 1846) The most interesting summary of doctrine and practice by the author himself is the introduction to the 3d ed of *Observationes Medicæ* (1676) (C C)

SYDNEY, the capital of New South Wales, and the oldest city in Australia, is situated on the east coast of that island-continent in 33° 51′ 41″ S lat and 151° 12′ 23″ 25 (10h 4m 49 55s) E long It lies on the southern shore of the magnificent harbour of Port Jackson, which in 1770 was named, though not discovered, by Captain Cook He anchored and landed in Botany Bay, about 6 miles to the south, and on afterwards coasting to the north noted what looked like an inlet, to which he gave the name of Port Jackson, after Sir George Jackson, one of the secretaries to the admiralty It may seem strange that so careful an observer as Cook should have passed close to one of the finest harbours in the world without recognizing its capacity, but the cliffs which guard the entrance are 300 feet in height, and no view of the landlocked basin can be seen from the masthead Middle Head, which is posted right opposite the entrance, closes it in, and it is necessary to enter, turn to the south, and then to the west before the best part of the harbour discloses itself This topographical peculiarity gives to the port its great shelter. When in 1788 Captain Phillip arrived at Botany Bay with the first convict fleet, he found its shallow waters and flat shores unsuited for the purposes of a settlement Strangely enough he was also deterred by the want of water, yet it is on that very shore that the pumping-engine is situated by which Sydney has been supplied for many years Going northwards, he turned in to examine Port Jackson inlet Thither the fleet was instantly removed, and Sydney was founded, and Australian colonization started, on 26th January 1788 Captain Phillip's choice of a site was determined by the existence of fresh water in a small stream running into Sydney Cove

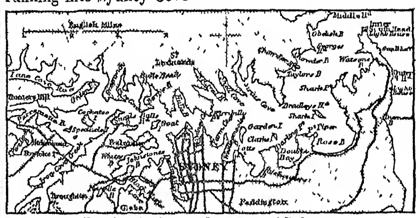

FIG 1 —Harbour and environs of Sydney

The port is flanked on both sides by a number of promontories—its characteristic feature—so that in addition to a broad central channel with deep water there is both on the north and the south side a series of sheltered bays with good anchorage The entrance is a mile wide, with a minimum depth of 15 fathoms. Some little distance inside is a rock awash, known as the Sow and Pigs, between which and the nearest headlands on either side is an inner bar, with 20 feet of water at low tide; through this bar on the southern side a ship channel has been dredged giving 27 feet of water at neap tide. On the southern side there occur in succession Watson's Bay, Rose

Bay, Double Bay, Rushcutter's Bay, Woolloomooloo Bay, Farm Cove, Sydney Cove, Darling Harbour, Johnstone's Bay, Blackwattle Bay, Iron Cove, Five Dock Bay, Hen and Chickens Bay, besides smaller inlets On the northern side, beginning again at the Heads, there are North Harbour, Middle Harbour (with many subsidiary inlets), Chowder Bay, Sirius Cove, Mossman's Bay, Shell Cove, Neutral Bay, Careening Cove, Lavender Bay, Berry's Bay, Ball's Head Bay, Lane Cove, Tarban Creek, and other small bays All these promontories and coves give a length of water frontage which is estimated at not less than 110 miles Besides these, Botany Bay, though shallow and exposed and destitute of promontories, has a coastline of about 18 miles Into it debouches George's river, which is navigable to Liverpool, a distance of 14 miles from the mouth, and in which are several capacious bays

The metropolitan area of Sydney really consists of a peninsula about 13 miles in length, lying between Parramatta and George's rivers The sea frontage of this area, from the South Head of Port Jackson to the North Head of Botany Bay, is 12 miles in length, and consists alternately of bold cliffs and beautiful beaches Two of the latter—Bondi and Coogee—are connected with the city by tramways, and are favourite places of holiday resort Sydney occupies, therefore, a position enjoying singular natural advantages

The city proper, as subsequently determined, takes in the water frontage from the head of Rushcutter's Bay on

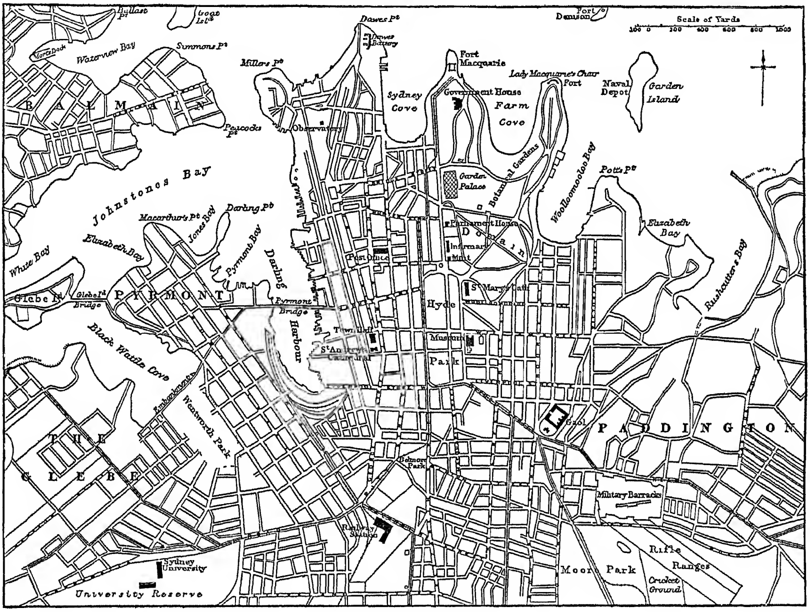

FIG 2 —Map of Sydney

the east to the head of Blackwattle Bay on the west, giving a shore-line of 8 miles, of which $1\frac{5}{8}$ are the frontage of the Domain and Botanic Gardens The remainder is occupied for commercial purposes, and is held partly by the Government and partly by private owners There are three large public wharfs—one, known as Circular Quay, embracing the greater part of Sydney Cove, seven-eighths of a mile in length, the second at the head of Darling Harbour, a quarter of a mile in extent, and the third at the head of Woolloomooloo Bay The rest is occupied by private wharfs, the principal of which are on the east shore of Darling Harbour A project is on foot for the resumption of the whole by the Government, and the making of a uniform quay, with a railway and a new street The area of the city is 2670 acres, of which no part is more than a mile and a quarter distant from the water, whilst the average distance is three-quarters of a mile The surface contour is undulating, the maximum elevation being 230 feet and the average 120 The soil is sandstone, covered more or less with shaly clay Of the city area about 800 acres are devoted to public use The largest reserve is Moore Park, lying to the south-east of the city, nearly 500 acres in extent—originally a waste of sandhills. On it are the rifle range, the Agricultural Society's showground, and the principal cricket ground The Inner and Outer Domains on the shore of the harbour contain about 130 acres The former contains Government House, with its private garden and paddocks, the Outer Domain is a public park The beautiful botanic gardens occupy the shore-line of Farm Cove, commanding the man-of-war anchorage Hyde Park, the original race-course of the city, is about 49 acres in extent At the north entrance is a statue of Prince Albert, and on its most elevated part is one of Captain Cook Prince Alfred Park, on the southern boundary of the city, originally called Cleveland Paddocks, occupies nearly

18 acres, and in it is the original exhibition building, now much used for concerts and festive gatherings. Belmore Park occupies 10 acres, and Cook and Phillip Parks each about the same area. The Fort Phillip reserve is a sort of acropolis, two of its rocky sides being escarped. Here, at an elevation of 146 feet, stands the astronomical observatory. Grose Farm, on the south-west of the city, was the site of one of the earliest attempts at Government farming. It is an undulating and elevated piece of land, and is divided amongst the university and the affiliated colleges of St Paul, St John, and St Andrew, the Prince Alfred Hospital, and Victoria Park.

The city started from the banks of the Tank stream at the head of Sydney Cove, and the chief business part is still in the limited area lying between Darling Harbour and the Domain and Hyde Park. The streets are irregular in width, some of them narrow and close together, while those leading down to Darling Harbour have a steep incline. Sydney has consequently more the look of an Old-World city than any other in Australia, and in its lack of spacious promenades and open squares and places, and in its poor opportunity for displaying its public buildings, it contrasts unfavourably with the more symmetrically planned sister cities of Australia. On the other hand, it has a charm which is all its own, as the glimpses of the harbour and the shipping obtainable from so many points give a delightful variety to the street vistas. The principal business street is George Street, 2 miles long, flanked with handsome commercial buildings. In this street are the post-office, the town-hall, the cathedral, and the main railway station. Only second in importance is Pitt Street, which runs nearly parallel with it as far as the railway station.

The public and private buildings of Old Sydney are of a primitive order of architecture, but they are rapidly disappearing as the city is being rebuilt. With the exception of Government House, the university and affiliated colleges, and the registrar general's office, all the non ecclesiastical public buildings are in a classical style. Of the modern public buildings the museum, the post-office, the offices for the colonial secretary, the minister for public works, and the minister for lands, and the custom-house are the finest. The town hall is a fine building, but a little too florid; the great hall, when finished, will be the largest in Australia. The Anglican cathedral in George Street is small. A Roman Catholic cathedral, on the east side of Hyde Park, replaces an earlier one that was burnt down, and will, when completed, be the finest ecclesiastical edifice in the city. The mint (an adaptation of an old hospital) is an imperial establishment, the cost of which is defrayed by the colonists. The annual value of the coinage from local gold is about £500,000, and this coinage has imperial currency. All the large public buildings are constructed of Sydney sandstone, which is abundant in quantity, though variable in quality. The best comes from the quarries in Pyrmont.

The length of streets, lanes, and public ways is about 100 miles. These are mostly macadamized, but wood paving has lately come much into favour. The saleyards for cattle and sheep (area 40 acres) are 7 miles off, at Homebush. The gross city revenue from all sources is about £376,000. For municipal purposes the city is divided into eight wards, each returning three aldermen, and for parliamentary purposes into three electorates—east, west, and south—each returning four members. In 1881 the city population was 105,000. It was in 1886 officially estimated at 125,000. The population of the suburbs was officially estimated in 1884 at 150,000, making a total metropolitan population of 275,000. Communication with the suburbs[1] is maintained to a large extent by steam tramways, entirely in the hands of the Government. The whole district between Sydney and Parramatta is practically suburban for 2 miles on each side of the railway. The fashionable suburbs lie to the east of Sydney, the business extension of the city being more to the westward. The southern side is largely devoted to manufacturing operations, and population is rapidly extending in the direction of Botany Bay. The north shore of the harbour is outside the city limits, and the communication is by steam ferries. The north shore has deep water close in shore, but little level ground, the land rising rapidly to an elevation of 300 feet. Up this ascent the Government has constructed a cable tramway, and from the railway between Newcastle and Sydney, which crosses the Parramatta river 2 miles below the head of the navigation, there is to be a branch line of railway to the north shore, opposite the city.

Water was at first obtained from the so called Tank stream; afterwards recourse was had to a lagoon on the southern slope of the dividing ridge between Port Jackson and Botany Bay, from which an artificial tunnel, known as Busby's Bore, brought the water into the city at the level of Hyde Park. When a further supply was wanted the same watercourse was utilized, the works being constructed at the point where it flowed into Botany Bay. A scheme is now (1886) in course of execution to bring water from the Upper Nepean, at a point 63 miles from Sydney. Two streams running in deep sandstone gorges are connected by a tunnel, and then united waters are brought in an open conduit. From the nature of the ground no large reservoir is possible near its source; but about 15 miles from Sydney, at Prospect, near Parramatta, a dam thrown across a valley makes a storage reservoir that will hold a year's supply. From that point the water is taken by open canal and piping to the existing reservoir in Crown Street, the limited area at a higher level being supplied by pumping. The delivery into the city will be over 150,000,000 gallons daily, and the cost of the whole works will exceed £1,500,000.

The old system of sewerage having several outfalls along the city front proved so objectionable that a new system has been designed, and is in course of execution, whereby the harbour will be preserved from all pollution. A great drain is carried from the city to the ocean at a projecting headland north of Bondi Bay known as Ben Buckler, where the sewage will go at once into deep water with a southerly current. The mouth of the sewer, though exposed to the beat of the ocean in very heavy weather, is 6 feet above high-water mark, and from that point it rises with a uniform inclination of 1 in 109, and in a nearly straight line, for a distance of 4 miles 25 chains. This main sewer, which throughout is one continuous monolith in concrete, passes in tunnels under the rocky ridges, and on concrete arches across the intervening flats. It diminishes in size from $8\frac{1}{2}$ by $7\frac{1}{2}$ feet to 5 feet 1 inch by 4 feet 1 inch, and at the upper end it bifurcates to accommodate two separate districts. It is of an oblate, oviform section, as nearly circular as is consistent with a minimum velocity of $2\frac{1}{4}$ feet a second. It drains an area of 4282 acres, and is calculated to discharge all the sewage when this area is populated as thickly as London, together with half an inch of rain per day. The bulk of the storm water is to pass off by surface drains. The sewage of the zone of land along the foreshore is to be lifted into the main sewer. From the southern slope of Sydney another large sewer runs southwards, and, crossing the mouth of Cook's River by a siphon, discharges its contents upon a sandy peninsula well suited for the purpose of a sewage farm.

The jurisdiction of the port of Sydney is in the hands of a marine board, of which three members are elected by the shipping interest, and three others and the president are nominated by the Government. They have the control of the pilot service, which is entirely a Government department. A new lighthouse has recently been erected on the South Head cliff, fitted with a powerful electric light, which is visible 27 miles off. The quarantine ground on North Head is isolated from the adjacent watering place of Manly Beach by a fence and a broad belt of unoccupied land. Ships in quarantine anchor in a sheltered position off the beach, where a hospital ship is also stationed.

Port Jackson being the chief naval depot of Australasia and the headquarters of the admiral's station, the fortifications of the harbour have engaged the attention of successive Governments. The inner line of defence constructed by Sir William Denison has been superseded by more elaborate works. On the north side of the harbour Middle Head, George's Head, and Bradley's Head have powerful guns which cross fire with those on the South Head, completely commanding the entrance to the channel. There is also a very effective torpedo service. Garden Island, off the mouth of Woolloomooloo Bay, has been handed over to the imperial Government as a naval depôt; the man of war anchorage is close under its lee, and the colonial Government has constructed all necessary wharfs and store-houses. There is a Government dock at Cockatoo Island capable of accommodating the largest vessels, with a machine-shop close by. Adjoining this a new dock is being hewn out of the sandstone 600 feet in length and 108 feet wide; the depth of water over the sill at spring tide is to be 32 feet, and at neap tide 29 feet 6 inches, and the width at the entrance 84 feet. Mort's Dock and Engineering Company have a large dock at Waterview Bay capable of taking in all the ordinary mail steamers. There is also a patent slip, which can take up vessels of 1000 tons, and a second is in course of construction for vessels of 1500 tons. The graving-dock is 410 feet long. Besides this, there are other smaller patent slips, and a floating dock for the accommodation of smaller craft.

Sydney is in the centre of a great coal-basin, the eastern part of which is supposed to be under the sea; whether a workable seam exists under the city itself, and, if so, at what depth, is at present undetermined, borings of 2000 feet having as yet failed to strike the coal. The seams crop out at Lake Macquarie, north of Sydney, and dip to the south; they also rise to the surface at the south of Sydney, where they dip to the north. Twenty-four miles south of Sydney the seam has been found at a depth of 850 feet, and at

[1] Paddington forms practically an eastern suburb of Sydney, with which there is constant omnibus communication. Victoria barracks are situated within its boundaries. Paddington is inhabited chiefly by the better classes, and possesses a number of public and private schools. A municipal constitution was granted it in April 1860. The population of the borough in 1881 was 9608.

about the same distance to the north at a depth of 600 feet. Coal is also brought into the city by railway from the Blue Mountains and from the Mittagong district, but it is inferior in quality to that mined on the coast.

The abundance and cheapness of coal, as well as the natural and commercial advantages of Sydney, have been favourable to certain lines of manufacturing industry, notwithstanding the high price of labour. In addition to the industries connected with shipping, those connected with the pastoral industry have also been developed, such as tanning, glue-making, meat-preserving, &c. The large railway works have, under the patronage of the Government, led to the manufacture of locomotives, and nearly all the rolling stock is made in the colonies. Omnibuses, cabs, carriages, buggies, drays, and carts are made in every variety and of excellent quality, as is also harness. Bootmaking is an extensive business; there are also manufactories of tobacco, sugar, kerosene, spirits, beer, tweed, paper, furniture, glass, pottery, and stoves, as well as a great variety of minor industries.

Public schools abound, with merely nominal fees. There is a high school for boys and girls. The grammar-school, with an attendance of 400 boys, receives from Government £1500 a year, with the free use of the buildings. To the handsome university buildings a medical school is now being added. The great hall is the finest Gothic building in Australasia. The university is a teaching as well as examining institution, degrees being given in the four faculties of arts, medicine, law, and science. The university, which is governed by a senate elected by the graduates, has a Government endowment of £12,000 a year, and has been enriched by several donations and bequests (amounting to £250,000, of which about £180,000 by Mr Challis). To it are attached three denominational affiliated colleges, one belonging to the Anglican Church, one to the Roman Catholic, and one to the Presbyterian; to each the Government contributed the land, £10,000 towards the building fund, and an annual stipend of £500 a year for the principal. Technical education is conducted under the auspices of a board supported entirely at the cost of the Government. The pupils already number more than a thousand, and the attendance at the classes is steadily increasing. There is a good school of arts, with 400 members, and a good circulating library. The public free library is supported by the Government, and to it is attached a lending branch. The Royal Society has a roll of 500 members, meets periodically for the reading and discussion of scientific papers, publishes its transactions, and has a small library. The Linnean Society is also well supported, and a Geographical Society has lately been started. The museum, in College Street, is managed by trustees and supported wholly at the cost of the Government. There is a small museum attached to the university, to which Mr Macleay has bequeathed his collection, which is especially rich in natural history.

Sydney has many charitable institutions. It has three hospitals, the newest and largest, which is close to the university, having been built after the best European models. There are three large lunatic asylums in the suburbs; the latest is on the pavilion principle. The benevolent asylum, which is mainly supported by the Government, gives a large amount of outdoor assistance, takes in all waifs and strays, and acts as a lying-in hospital. Old men are provided for in an institution at Liverpool. At Randwick is an asylum for destitute children, which receives a large amount of Government support; and there are two orphan asylums at Parramatta; but the state children are now being boarded out under the auspices of a Government board. There are two soup kitchens and refuges, supported by private contributions, and also a charity organization society. There is a home visiting and relief society, intended principally for those who have known better days, and a prisoners' aid society, besides numerous friendly societies. All the churches are well represented, and to each is attached one or more charitable agencies.

The climate of Sydney is mild and moderately equable. It resembles closely the climate of Toulon. The mean temperature is 62°.6 Fahr. and the extreme range of the shade thermometer is from 106° to 36° Fahr. The sea breeze which prevails during the summer comes from the north-east, and, while it tempers the heat, makes the air moist and induces languor. In winter the prevailing wind is from the west, and the air is dry and bracing. The annual rainfall is 50 inches. The hot north-west wind of summer sometimes sends the humidity down below 30°, and once it has been as low as 16°. In the cool westerly winds of winter it seldom falls to 55°, and never below 45°. The average humidity for the year is 74°. The mean tide is 3 feet 3 inches. (A. GA.)

SYENITE. See GRANITE, vol. xi. p. 49.

SYLBURG, FRIEDRICH (1536-1596), an eminent Greek scholar, and one of the greatest figures in the annals of German philology, was the son of a farmer, and was born at Wetter near Marburg in 1536. Wetter had then an excellent school, taught by J. Ferinarius and Justus Vulteius, and Sylburg also got help in his studies from the preacher J. Pincier, whose daughter he subsequently married. His studies were continued at Marburg and Jena, and then at Geneva (1559) and at Paris. Here his teacher was Henry Estienne (Stephens), to whose great Greek *Thesaurus* Sylburg afterwards made important contributions. Returning to Germany, he was for a time a schoolmaster at Neuhaus near Worms, and then head of a new gymnasium at Lich, where he edited a useful edition of Nicolas Cleynart's *Greek Grammar* (Frankfort, 1580), which was thrice reprinted during his lifetime. But the period of his important literary labours began when (having previously, in 1581, declined a call to the Greek chair at Marburg) he resigned his post at Lich and moved to Frankfort to act as corrector and editor of Greek texts for the enterprising publisher J. Wechel. To his Frankfort period belong the editions of Pausanias (1583), Herodotus (1584), Dionysius of Halicarnassus (2 vols., 1586—one of his best pieces of work), Aristotle (5 vols., 1587—dedicated to the landgraves of Hesse, from one of whom, Louis IV., he received a pension), the Greek and Latin sources for the history of the Roman emperors (3 vols., 1589-90), and the Περὶ συντάξεως of Apollonius. In 1591 he was attracted to Heidelberg by the treasures of the library, not yet scattered by the Thirty Years' War. Here he became librarian to the elector palatine, and was untiring in collecting further MS. treasures. At the same time the series of editions, which Wechel had begun to find too costly, was continued by the Heidelberg publisher Hieronymus Commelinus. At Heidelberg were printed Clement of Alexandria (1592), Justin Martyr (1593), the *Etymologicum Magnum* (1594), the *Scriptores de Re Rustica* (1595), the Greek gnomic poets (1596), Xenophon (1596), Nonnus (1596), and other works. All Sylburg's editions show great critical power and indefatigable industry. Indeed he wore himself out with work, and died on 16th February 1596, "nimiis vigiliis ac typographicis laboribus consumptus," as his tombstone in the churchyard of St Peter's in Heidelberg has it. There is a careful notice of his life by K. W. Justi in Strieder's *Hessische Gelehrten-Geschichte*, xviii. 481 *sq.*

SYLHET, a British district of India, in the province of Assam, lying between 25° 12′ and 23° 59′ N. lat. and 91° and 92° 38′ E. long., with an area of 5381 square miles. It is bounded on the N. by the Khási and Jaintia Hills district, on the E. by Cachar, on the S. by the state of Hill Tipperah and the district of Tipperah, and on the W. by the district of Maimansinh. Sylhet consists of the lower valley of the Surma or Barak river, and for the most part is a uniform level, broken only by scattered clusters of sandy hillocks called *tilás*, and intersected by a network of rivers and drainage channels. In the south eight low ranges of hills, spurs of the Tipperah Mountains, run out into the plain, the highest range being about 1500 feet above sea-level. There is also a small detached group in the centre of the district called the Ita Hills. Entering the district from Cachar, the Surma bifurcates into two branches: the main branch flows beneath the hills bordering the north-east part, while the minor branch, the Kusiára, flows in a south-westerly direction across the district; they again unite on the south-western boundary and fall into the Meghna under the name of Dhaleswari. Both branches are navigable by large boats and support a busy traffic. The wild animals of the district comprise elephants, tigers, buffaloes, bison, and several varieties of deer. The climate of Sylhet is extremely damp and the rainfall is heavy, reaching an annual average of over 150 inches; the rainy season generally lasts from April to October.

In 1881 the population was returned at 1,969,009, of whom 999,785 were males and 969,224 females. Hindus numbered 949,353, Mohammedans 1,015,531, and hill tribes 3708. The only places with a population exceeding 5000 are Sylhet town (14,407) and Kashba Baniachang, a large village (24,061). Sylhet town, the administrative headquarters of the district, is situated on the right or north bank of the Surma, and besides the usual public offices contains a handsome church and the mosque of Sháh Jalál (a fakir whose miraculous powers contributed greatly to the Mussulman conquest of the country), which attracts pilgrims from great distances. Out of the total area 3080 square miles were returned as under cultivation in 1882-83 and 654 as cultivable. The staple crop is rice, which yields three harvests during the year. There are immense forest tracts in the south-eastern parts of Sylhet. The chief industries are the weaving by Manipuri women of cotton cloths called *Manipuri khesh*, also handkerchiefs and mosquito curtains tastefully embroidered with silk. The manufacture of mats, ivory and shell carving, and other ornamental work are also pursued with much skill and elegance.

Sylhet with the rest of Bengal passed into the hands of the British in 1765. Previous to 1874 Sylhet formed an integral part of Bengal, being included in the Dacca division; but in September of that year it was annexed, together with the adjoining district of Cachar, to the chief commissionership of Assam.

SYLT (probably from the Old Frisian *Silendh*, *i.e.*, "sea-land") is the largest German island in the North Sea, being 40 square miles in area and nearly 23 miles long. It is, however, very narrow, generally about half a mile in width, except in the middle, where it sends out a peninsula 7 miles across. It belongs to the province of Schleswig-Holstein, and lies from 7 to 12 miles from the Schleswig coast. Its long and slender outline is highly suggestive of its former position as part of a continuous line of coast, now in great part swept away. The invasion of the sea has made considerable progress even within a comparatively recent period, and several hamlets were swallowed up in the 13th and 14th centuries. The process of gradual waste is still going on, though it is now obviated to some extent by the exertions of the Prussian Government, and counterbalanced by deposits of mud on the landward side. The central peninsula contains some "marshland" and moorland pasture, on which a few thousand sheep are grazed, but the rest of the island consists merely of dunes or sand-hills, which at places attain a height of from 100 to 150 feet. The inhabitants, about 3000 in number, are of Frisian origin, though a few in the extreme north of the island speak Danish. Their occupations are fishing, oyster-dredging, seamanship, and wild-duck catching; the women make large quantities of woollen jackets. The chief places are Keitum (850 inhabitants), Westerland, which is annually visited by about 1500 sea-bathers, and Morsum. Some very interesting pagan tombs have been found on the island.

SYMBOL. See CREEDS.

SYME, JAMES (1799-1870), surgeon, was born at Edinburgh on 7th November 1799. His father was a writer to the signet and a landowner in Fife and Kinross, who lost most of his fortune in attempting to develop the mineral resources of his property. James was sent to the High School at the age of nine, and remained there until he was fifteen, when he entered the university. For two years he frequented the arts classes (including botany), and in 1817 began the medical curriculum, devoting himself with particular keenness to chemistry. His chemical experiments led him to the discovery that "a valuable substance is obtainable from coal tar which has the property of dissolving india-rubber," and could be used for waterproofing silk and other textile fabrics,—an idea which was patented a few months afterwards by Macintosh of Glasgow. In the session of 1818-19 Syme became assistant and demonstrator in the dissecting room of Liston, who had started as an extra-mural teacher of anatomy in competition with his old master Barclay; in those years he held also resident appointments in the infirmary and the fever hospital, and spent some time in Paris practising dissection and operative surgery. In 1823 Liston handed over to him the whole charge of his anatomy classes, retaining his interest in the school as a pecuniary venture; the arrangement did not work smoothly, and a feud with Liston arose, which did not terminate until twenty years later, when the latter was settled in London. Syme's next venture was the Brown Square school of medicine, which he started in 1824-25 in conjunction with Dr Macintosh, Dr Fletcher, and others; the partnership was again inharmonious, and soon came to an end. Announcing his intention to practise surgery only, Syme started a surgical hospital of his own, Minto House hospital, which he carried on from May 1829 to September 1833, with great success as a surgical charity and school of clinical instruction. It was here that he first put into practice his method of clinical teaching, which consisted in having the patients to be operated or prelected upon brought from the ward into a lecture-room or theatre where the students were seated conveniently for seeing and taking notes. His private practice had become very considerable, his position having been assured ever since his amputation at the hip joint in 1823, the first of the kind in Scotland. In 1833 he succeeded Russel as professor of clinical surgery in the university. Syme's accession to the clinical chair was marked by two important changes in the conditions of it: the first was that the professor should have the care of surgical patients in the infirmary in right of his professorship, and the second, that attendance on his course should be obligatory on all candidates for the medical degree. When Liston removed to London in 1835 Syme became the leading consulting surgeon in Scotland. On Liston's death in 1847 Syme was offered his vacant chair of clinical surgery at University College, London, and accepted it. He began practice in London in February 1848, but early in May the same year difficulties with two of his colleagues at Gower Street and a desire to "escape from animosity and contention" led him to throw up his appointment. He returned to Edinburgh in July, and was reinstated in his old chair, which the crown authority had meanwhile found a difficulty in appointing to. The judgment of his friends was that "he was always right in the matter, but often wrong in the manner, of his quarrels." In 1849 he broached the subject of medical reform in a letter to the lord advocate; in 1854 and 1857 he addressed open letters on the same subject to Lord Palmerston; and in 1858 a Medical Act was passed which largely followed the lines laid down by himself. As a member of the General Medical Council called into existence by the Act, he made considerable stir in 1868 by an uncompromising statement of doctrines on medical education, which were thought by many to be reactionary; they were, however, merely an attempt to recommend the methods that had been characteristic of Edinburgh teaching since Cullen's time,—namely, a constant reference of facts to principles, the subordination (but not the sacrifice) of technical details to generalities, and the preference of large professorial classes and the "magnetism of numbers" to the tutorial system, which he identified with "cramming." In April 1869 he had a paralytic seizure, and at once resigned his chair; he never recovered his powers, and died on 26th June 1870.

Syme's surgical writings are numerous, although the terseness of his style and directness of his method save them from being bulky. In 1831 he published *A Treatise on the Excision of Diseased Joints* (the celebrated ankle joint amputation is known by his name). His *Principles of Surgery* (often reprinted) came out a few months later; *Diseases of the Rectum* in 1838; *Stricture of the Urethra and Fistula in Perineo* in 1849; and *Excision of the Scapula* in 1864. In 1848 he collected into a volume, under the title of *Contributions*

to the Pathology and Practice of Surgery, thirty-one original memoirs published in periodicals from time to time, and in 1861 he issued another volume of *Observations in Clinical Surgery*. Syme's character is not inaptly summed up in the dedication to him by his old pupil, Dr John Brown, of the series of essays *Locke and Sydenham*: "Verax, capax, perspicax, sagax, efficax, tenax."

See *Memorials of the Life of James Syme*, by R. Paterson, M.D., with portraits, Edinburgh, 1874.

SYMEON OF DURHAM was the author of two works of great importance in English history, especially in that of northern England, viz., the *Historia Dunelmensis Ecclesiæ* and the *Historia Regum*. Very little is known of his life. There is no record of the date of his birth or death. He was at Jarrow about 1080, before the monastic community moved thence to Durham (1083). He probably did not become a professed monk till some time after that event. In 1104 he was present at the opening of the coffin and the examination of the remains of St Cuthbert. Between 1104 and 1108 he composed his *History of the Church of Durham*, bringing it down to the death of William of St Carilef (1096). Many years later he compiled his *Historia Regum*, which is a chronicle of Northumbrian affairs from the date at which Bede stops (731). He was also probably the author of a letter *De Archiepiscopis Eboraci*, but not of the treatise *De Miraculis et Translationibus* sometimes attributed to him. Selden, in his introduction to Twysden's *Decem Scriptores*, attributes the *Historia Dunelmensis Ecclesiæ* to Turgot, prior of that church; but Mr Arnold, in the preface to his edition of Symeon's works, successfully disproves Selden's assertions. This work is original and of great value; the *Historia Regum*, on the other hand, is a compilation from various sources, brought down by Symeon to 1121 or 1129. Both works were continued by other hands.

See Twysden, *Decem Scriptores*, and prefaces to Symeon's works, by Mr Hodgson Hinde (Surtees Society edition, 1868) and by Mr T. Arnold (Rolls Series edition, 1882-85).

SYMEON, surnamed METAPHRASTES, Byzantine hagiographer, according to Leo Allatius (*De Symeonum Scriptis*, Paris, 1664), lived during the first half of the 10th century under Leo the Philosopher and his successor at Constantinople, where he successively held the positions of secretary, grand logothete, and master of the palace. This view, subsequently adopted by Cave, Fabricius, and others, was afterwards disputed, but not convincingly, by Oudin (*Comm. de Script. Eccles. Antiq.*, vol. ii., 1722), who identified Metaphrastes with another Symeon who also held the offices of logothete and master of the palace under John Comnenus, and published a still extant *Epitome Canonum* in 1160. Symeon's *Metaphrases*, as his legends are called (whence his name Metaphrastes), occur in MS. in many European libraries; many of them are also to be found in the *Acta Sanctorum* and similar collections; but others remain unprinted. Allatius and Cave recognize only 122 of the hundreds of lives assigned to him as genuine. The titles of other writings of Symeon, with references to further authorities, will be found in the article "Metaphrastes," by Gass, in Herzog-Plitt's *Encykl.*, vol. ix.

SYMMACHUS, pope from 498 to 514, had Anastasius II. for his predecessor and was himself followed by Hormisdas. He was a native of Sardinia, apparently a convert from paganism, and was in deacon's orders at the time of his election. The choice was not unanimous, another candidate, Laurentius, having the support of a strong Byzantine party; and both competitors were consecrated by their friends, the one in the Lateran church and the other in that of St Mary, on 22d November 498. A decision was not long afterwards obtained in favour of Symmachus from Theodoric, to whom the dispute had been referred; but peace was not established until 505 or 506, when the Gothic king ordered the Laurentian party to surrender the churches of which they had taken possession. An important incident in the protracted controversy was the decision of the "palmary synod" (see vol. xix. p. 492). The remainder of the pontificate of Symmachus was uneventful; history speaks of various churches in Rome as having been built or beautified by him.

SYMMACHUS, QUINTUS AURELIUS, consul in 391, and one of the most brilliant representatives in public life and in literature of the old pagan party at Rome, was educated in Gaul, and, having discharged the functions of prætor and quæstor, rose to higher offices, and in 373 was proconsul of Africa. His public dignities, which included that of pontiff, his great wealth and high character, added to his reputation for eloquence, marked him out as the champion of the pagan senate against the measures which the Christian emperors directed against the old state religion of Rome. In 382 he was banished from Rome by Gratian for his protest against the removal of the statue and altar of Victory from the senate-house, and in 384, when he was prefect of the city, he addressed to Valentinian a letter praying for the restoration of these symbols. This is the most interesting of his literary remains, and called forth two replies from St Ambrose, as well as a poetical refutation from Prudentius. After this Symmachus was involved in the rebellion of Maximus, but obtained his pardon from Theodosius, and appears to have continued in public life up to his death.

Of the writings of Symmachus we possess (1) ten books of *Epistles*, published after his death by his son. The model followed by the writer is Pliny the Younger, and from a reference in the *Saturnalia* of Macrobius (bk. v., i. § 7), in which Symmachus is introduced as one of the interlocutors, it appears that his contemporaries deemed him second to none of the ancients in the "rich and florid" style. The first edition of the *Epistles* by Bart. Cyniscus (*s. l. et a.*, but published under Pope Julius II.) is very incomplete, and the collection was only gradually completed by subsequent editors. (2) Fragments of nine *Complimentary Orations* from a palimpsest, of which part is at Milan and part in the Vatican, were discovered by Mai, who published the Milan fragments in 1815, the Roman ones in his *Scriptorum Veterum Nova Collectio*, vol. i. (1825), and the whole in 1846. The work was not well done, and many corrections are given in a new collation by O. Seeck (*Commentationes in Honorem Th. Mommseni*, Berlin, 1877, p. 595 *sq.*), which has been followed by an edition of the works of Symmachus in the *Monumenta Germaniæ Historica*, Berlin, 1883.

SYMPHONY. See MUSIC, vol. xvii. p. 95.

SYNAGOGUE (συναγωγή), literally "assemblage," is the term employed to denote either a congregation of Jews, *i.e.*, a local circle accustomed to meet together for worship and religious instruction, or the building in which the congregation met. In the first sense the word is a translation of כנסת, *keneseth*, in the second of בית הכנסת, *bêth hakkeneseth*. The germ of the synagogue, that is, of religious assemblages dissociated from the ancient ritual of the altar, may be found in the circle of the prophets and their disciples (see especially Isa. viii. 16 *sq.*); but the synagogue as an institution characteristic of Judaism arose after the work of Ezra, and is closely connected with the development of that legal Judaism to which his reformation gave definite shape. From the time of Ezra downwards it was the business of every Jew to know the law; the school (*bêth hammidrāsh*) trained scholars, but the synagogue, where the law was read every Sabbath (Acts xv. 21), was the means of popular instruction. Such synagogues existed in all parts of Judæa in the time of Psalm lxxiv. 8 (probably a psalm of the Persian period); in Acts xv. 21 it appears that they had existed for many generations "in every city." This held good not only for Palestine but for the Dispersion; in post-Talmudic times the rule was that a synagogue must be built wherever there were ten Jews. And, though the name "synagogue" varies with προσευχή ("place of prayer"), it appears that everywhere the assemblage was primarily one for instruction in the law: the synagogue, as Philo puts it, was a διδασκαλεῖον. A formed institution

of this sort required some organization the general order of the service was directed by one or more "rulers of the synagogue" (ἀρχισυνάγωγοι, Luke xiii 14, Acts xiii 15), who called on fit persons to read, pray, and preach, alms were collected by two or more "collectors" (*gabbâê ṣedāḳā*), and a "minister" (*ḥazzân*, ὑπηρέτης, Luke iv 20) had charge of the sacred books (preserved in an "ark") and of other ministerial functions, including the teaching of children to read The discipline of the congregation was enforced by excommunication (*ḥērem*) or temporary exclusion (*niddûy*), and also by the minor punishment of scourging (Matt x 17), inflicted by the *ḥazzân* The disciplinary power was in the hands of a senate of elders (πρεσβύτεροι, γερουσία), the chief members of which were ἄρχοντες The principal service of the synagogue was held on Sabbath morning, and included, according to the Mishnah, the recitation of the *shema'* (Deut vi 4-9, xi 13-21, Numb xv 37-41), prayer, lessons from the law and prophets with Aramaic translation, a sermon (*derāshah*) based on the lesson (Acts xiii 15), and finally a blessing pronounced by the priest or invoked by a layman On Sabbath afternoon and on Monday and Thursday there was a service without a lesson from the prophets, there were also services for all feast-days Synagogues were built by preference beside water for the convenience of the ceremonial ablutions (comp Acts xvi 13), and remains of very ancient buildings of this class exist in several parts of Galilee, they generally lie north and south, and seem to have had three doors to the south, and sometimes to have been divided by columns into a nave and two aisles

Jewish tradition has a great deal to say about a body called "the great synagogue," which is supposed to have been the supreme religious authority from the cessation of prophecy to the time of the high priest Simeon the Just, and is even said (by modern writers since Elias Levita) to have fixed the Old Testament canon (cp vol v p 3 *sq*) But Kuenen in his essay "Over de Mannen der Groote Synagoge" (*Verslagen* of the Amsterdam Academy, 1876) has shown that these traditions are fiction, and that the name *keneseth haggādôla* originally denoted, not a standing authority, but the great convocation of Neh viii -x

Compare in general Schürer, *Geschichte des jüdischen Volkes*, § 27, where the older literature is catalogued For the usages of the synagogue in more recent times, see Buxtorf, *Synagoge Judaica*, Basel, 1641

SYNEDRIUM (συνέδριον), a Greek word which means "assembly" and is especially used of judicial or representative assemblies, is the name by which (or by its Hebrew transcription, סנהדרין, *sanhedrîn*, *sanhedrîm*) that Jewish body is known which in its origin was the municipal council of Jerusalem, but acquired extended functions and no small authority and influence over the Jews at large (see vol xiii p 424 *sq*) In the Mishnah it is called "the sanhedrin," "the great sanhedrin," "the sanhedrin of seventy-one [members]," and "the great court of justice" (*bêth dîn haggādôl*) The oldest testimony to the existence and constitution of the synedrium of Jerusalem is probably to be found in 2 Chron xix 8, for the priests, Levites, and hereditary heads of houses there spoken of as sitting at Jerusalem as a court of appeal from the local judicatories does not correspond with anything mentioned in the old history, and it is the practice of the Chronicler to refer the institutions of his own time to an origin in ancient Israel And just such an aristocratic council is what seems to be meant by the gerusia or senate of "elders" repeatedly mentioned in the history of the Jews, both under the Greeks from the time of Antiochus the Great (Jos., *Ant*, xii 3, 3) and under the Hasmonean high priests and princes The high priest as the head of the state was doubtless also the head of the senate, which, according to Eastern usage, exercised both judicial and administrative or political functions (comp 1 Mac xii 6, xiv 20) The exact measure of its authority must have varied from time to time, at first with the measure of autonomy left to the nation by its foreign lords and afterwards with the more or less autocratic power claimed by the native sovereigns

As has been shown in vol xiii p 424 *sq*, the original aristocratic constitution of the senate began to be modified under the later Hasmoneans by the inevitable introduction of representatives of the rising party of the Pharisees, and this new element gained strength under Herod the Great, the bitter enemy of the priestly aristocracy [1] Finally under the Roman procurators the synedrium was left under the presidency of the chief priest as the highest native tribunal, though without the power of life and death (John xviii 31) The aristocratic element now again preponderated, as appears from Josephus and from the New Testament, in which "chief priests" and "rulers" are synonymous expressions But with these there sat also "scribes" or trained legal doctors of the Pharisees and other notables, who are simply called "elders" (Mark xv 1) The Jewish tradition which regards the synedrium as entirely composed of rabbins sitting under the presidency and vice-presidency of a pair of chief doctors, the *nāsî* and *āb bêth dîn*,[2] is quite false as regards the true synedrium It was after the fall of the state that a merely rabbinical *bêth dîn* sat at Jabneh and afterwards at Tiberias, and gave legal responses to those who chose to admit a judicature not recognized by the civil power Gradually this illegal court usurped such authority that it even ventured to pronounce capital sentences,—acting, however, with so much secrecy as to allow the Roman authorities to close their eyes to its proceedings (Origen, *Ep ad Afr*, § 14) That this was possible will appear less surprising if we remember that in like manner the synedrium of Jerusalem was able to extend an authority not sanctioned by Roman law over Jews beyond Judæa, *e g*, in Damascus (Acts ix 2, xxii 5)

The council chamber (βουλή) where the synedrium usually sat was between the Xystus and the temple, probably on the temple-hill, but hardly, as the Mishnah states, within the inner court The meeting in the palace of the high priest which condemned our Lord was exceptional The proceedings also on this occasion were highly irregular, if measured by the rules of procedure which, according to Jewish tradition, were laid down to secure order and a fair trial for the accused

Of the older literature of the subject it is enough to cite Selden, *De Synedriis* The most important critical discussion is that of Kuenen in the *Verslagen*, &c, of the Amsterdam Academy, 1866, p 131 *sq* A good summary is given by Schürer, *Geschichte des jüdischen Volkes*, 2d ed, § 23, iii

SYNESIUS, bishop of Ptolemais in the Libyan Pentapolis from 410 to *c* 414, was born of wealthy parents, who claimed descent from Spartan kings, at Cyrene about 375. While still a youth (393) he went with his brother Euoptius to Alexandria, where he became an enthusiastic Neoplatonist and disciple of HYPATIA (*q v*) Returning to his native place some time before 397, he was in that year chosen to head an embassy from the cities of the Pentapolis to the imperial court to ask for remission of taxation and other relief. His stay in Constantinople, which lasted three years, was wearisome and otherwise disagreeable, the leisure it forced upon him he devoted in part to literary composition (see his *De Providentia*). The oration he delivered when at last admitted to the presence of Arcadius is also extant (*De Regno*) Returning abruptly to Cyrene in 400, he spent the next ten years partly in that city, when unavoidable business called him there, but chiefly on an estate in the interior of the province, where

[1] The name *synedrium* first appears under Hyrcanus II (Jos., *Ant*, xiv 9, 4).

[2] The former word properly means the sovereign and the latter the president of the tribunal. The false traditional application is post-Mishnic

he was able to enjoy the literary leisure that was most congenial to him, varying his studies with gardening and hunting and the quiet pleasures of domestic life His marriage took place at Alexandria in 403, in the previous year he had visited Athens In 409 or 410 Synesius, whose Christianity had until then been by no means very pronounced, was popularly chosen to be bishop of Ptolemais, and, after long hesitation on personal and doctrinal grounds, he ultimately accepted the office thus thrust upon him, being consecrated by Theophilus at Alexandria One personal difficulty at least was obviated by his being allowed to retain his wife, to whom he was much attached, but as regarded orthodoxy he expressly stipulated for personal freedom to dissent on the questions of the soul's creation, a literal resurrection, and the final destruction of the world, while at the same time he agreed to make some concession to popular views in his public teaching (τὰ μὲν οἴκοι φιλοσοφῶν, τὰ δ' ἔξω φιλομυθῶν) His tenure of the bishopric, which was comparatively brief, was troubled not only by domestic bereavements but also by barbaric invasions of the country, and by conflicts with the prefect Andronicus, whom he excommunicated for interfering with the church's right of asylum The date of his death is unknown, but he died probably not later than 414

His extant works are—(1) a speech before Arcadius, *De Regno*, (2) *Dio, sive de suo ipsius Instituto*, in which he signifies his purpose to devote himself to true philosophy, (3) *Encomium Calvitii*, a literary *jeu d'esprit*, suggested by Dio Chrysostom's *Praise of Hair*, (4) *De Providentia*, in two books, (5) *De Insomniis*, (6) 157 *Epistolæ*, (7) 12 *Hymni*, and several homilies and occasional speeches The *editio princeps* is that of Turnebus (Paris, 1553), it was followed by that of Morell, with Latin translation by Petavius (1612, greatly enlarged and improved 1633, reprinted by Migne, 1859) The *Epistolæ*, which for the modern reader greatly exceed his other works in interest, have been edited by Demetriades (Vienna, 1792) and by Glukus (Venice, 1812), the *Calvitii Encomium* by Krabinger (Stuttgart, 1834), the *De Providentia* by Krabinger (Sulzbach, 1835), the *De Regno* by Krabinger (Munich, 1825), and the *Hymns* by Flach (Tubingen, 1875)

SYNOD See COUNCIL and PRESBYTERIANISM

SYPHILIS See PATHOLOGY, vol XVIII pp 404, 405, and SURGERY, p 686 above

SYRA, or SYROS, a Greek island in the middle of the Cyclades, which in the 19th century has become the commercial centre of the Archipelago, and is also the residence of the nomarch of the Cyclades and the seat of the central law courts In ancient times this island was remarkably fertile, as is to be gathered not only from the Homeric description (*Od* XV 403), which might be of doubtful application, but also from the remains of olive presses and peculiarities in the local nomenclature The destruction of its forests has led to the loss of all its alluvial soil, and now it is for the most part a brown and barren rock, covered at best with scanty aromatic scrub, pastured by sheep and goats The length of the island is about 10 miles, the breadth 5, and the area is estimated at $42\frac{1}{2}$ square miles The population is now estimated to number about 33,700, of whom about 20,500 are in the chief town Commerce is the main occupation of the islanders, though they also build ships, have extensive tanneries, large steam flour-mills, a steam weaving and rope factory, and a handkerchief factory, and grow vegetables for export

Hermopolis, as the chief town is called, is built round the harbour on the east side of the island It is governed by an active municipality, whose revenue and expenditure have rapidly increased Among the public buildings are a spacious town hall in the central square, a club house, an opera-house, and a Greek theatre Old Syra, on a conical hill behind the port town, is an interesting place, with its old Roman Catholic church of St George's still crowning the summit This was built by the Capuchins, who in the Middle Ages chose Syra as the headquarters of a mission in the East Louis XIII, hearing of the dangers to which the Syra priests were exposed, took the island under his especial protection, and since that time the Roman Catholic bishops of Syra have been elected by the pope About the beginning of the 19th century the inhabitants of Syra numbered only about 1000, whenever a Turkish vessel appeared they made off to the interior and hid themselves On the outbreak of the war of Greek independence refugees from Chios, after being scattered throughout Tenos, Spezia, Hydra, &c, and rejected by the people of Ceos, took up their residence at Syra under the protection of the French flag Altogether about 40,000 had sought this asylum before the freedom of Greece was achieved The chief city was called Hermopolis after the name of the ship which brought the earlier settlers Most of the immigrants elected to stay, and, though they were long kept in alarm by pirates, they have continued steadily to prosper In 1875 1568 sailing ships and 698 steamers (with a total of 740,731 tons) entered and 1588 sailing ships and 700 steamers (with a total of 756,807 tons) cleared this port, in 1883 3379 sailing and 1126 steam vessels (with a total of 1,056,201 tons) entered and 3276 sailing and 1120 steam vessels (with a total of 960,229 tons) cleared Most of the sailing vessels were Greek and Turkish, and most of the steamers were Austrian, French, and Turkish

SYRACUSE (Συράκοσαι, Συράκουσαι, Συρήκουσαι, Lat *Syracusæ*, It *Siracusa*), the chief Greek city of ancient Sicily and one of the earliest Greek settlements in the island (see SICILY, p 15 above) The foundation legend takes several shapes (Thuc, VI 3, Strabo, VI 4, p 269), but there is no reason to doubt that Syracuse was founded by Archias of Corinth as part of a joint enterprise together with Corcyra, and the received date 735 B C may pass as approximate [1] The first settlement was on a small island, parted from the coast by a very narrow channel (for map, see pl II) It points southward, in front of a deep bay, which, with the opposite headland (Plemmyrium), it helps to shelter from the sea This formed the Great Harbour, the Lesser Harbour of Laccius lay to the north of the island, between it and a peninsula of the mainland, with the open sea to the east and north The peninsula consists of part of a hill which almost everywhere leaves some space between itself and the sea To the west of the Great Harbour a marshy plain lies on each side of the river Anapus On the south side of the river is a smaller hill The coast of the island and of the peninsula is rocky That of the harbour is for the most part flat, except part of the west and south sides and the headland opposite the island From the island the city spread over the whole peninsula, while a detached suburb (Polichne) arose on the outlying hill beyond Anapus The marshy ground between the two was not fit for building All these additions have been gradually forsaken, and the modern town is confined to the island

Topography

Island of Ortygia

The island was called Ortygia, a name connected with the Delian legend of Artemis (see Holm, *Gesch Sic*, I 886), but often simply the Island (Liv, XXV 24, 30) Though the lowest part of the city, its position and strength made it the citadel, and it is therefore often spoken of by Diodorus and Plutarch as if it had been a real acropolis It is famous for the fountain of Arethusa, connected in Greek legend with the river Alpheus in Peloponnesus [2] The sweet water perished when an earthquake brought in the sea in 1170 [3] At the time of the first settlement the island was held by Sicels, some have thought that a Phœnician element lingered on under both Sicels and Greeks It is certain (Herod, VII 166) that Syracuse and Carthage stood in relations to one another which were not usual between Greek and barbarian cities It has also been thought from some legendary hints that Polichne was the original Syracuse, and that the plural form (Συράκουσαι) arose from the union of Ortygia and Polichne But the plural form is common enough in other cases The chief evidence for the belief is that the

great temple of Olympian Zeus stood in Polichne and that (Plut, *Nic*, 14) the register of Syracusan citizens was kept there

Earliest historical period

Till the beginning of the 5th century B C our notices of Syracusan history are quite fragmentary Almost the only question is whether, as some stray notices (Athen, i 56, see Muller's *Dorians*, i 161, Eng tr) might suggest, the primitive kingship was retained or renewed at Syracuse, as it certainly was in some other Greek colonies A king Pollis is spoken of, but nothing is known of his actions It is far more certain that Syracuse went through the usual revolutions of a Greek city The descendants of the original settlers kept the land in their own hands, and they gradually brought the Sicel inhabitants to a state not unlike villainage Presently other settlers, perhaps not always Greek, gathered round the original Syracusan people, they formed a distinct body, δῆμος or *plebs*, personally free, but with an inferior political franchise or none at all The old citizens thus gradually grew into an exclusive or aristocratic body, called γάμοροι or landowners We hear incidentally of disputes, seditions, and changes, among others the banishment of a whole *gens* (Thuc, v 5, Arist, *Pol*, v 3, 5, 4, 1), but we have no dates or details till we have entered the 5th century B C In its external development Syracuse differed somewhat from other Sicilian cities Although it lagged in early times behind both Gela and Acragas (Agrigentum), it very soon began to aim at a combination of land and sea power Between 663 and 598 it founded the settlements of Acræ, Casmenæ, and Camarina, of which the first was unusually far inland The three together secured for Syracuse a continuous dominion to the south-east coast They were not strictly colonies but outposts, Camarina indeed was destroyed after a revolt against the ruling city (Thuc, v 1) That the inland Sicel town of Henna was ever a Syracusan settlement there is no reason to believe Of this early time some architectural monuments still remain, as the two temples in Ortygia, one of which is now the metropolitan church, and the small remains of the Olympieum or temple of Zeus in Polichne,—all of course in the ancient Doric style

The second period of Syracusan history, which roughly begins with the 5th century, is far better ascertained It is a period of change in every way The aristocratic commonwealth becomes in turn a tyranny and a democracy, and Syracuse becomes the greatest Greek city in Sicily, the mistress of other cities, the head of a great dominion,—for a moment, of the greatest dominion in Hellas Strange

Gelon

to say, all this growth begins in subjection to the ruler of another city Hippocrates, tyrant of Gela, held the chief power in eastern Sicily at the beginning of the 5th century B C (498-491) He threatened Syracuse as well as other cities, and it was delivered only by the joint intervention of Corinth and Corcyra, and by the cession of the vacant territory of Camarina In 485 the Syracusan δῆμος or *plebs* joined with the Sicel serf population to drive out the *gamoroi*, the ruling oligarchs These last craved help of Gelon, the successor of Hippocrates, who took possession of Syracuse without opposition, and made it the seat of his power. Syracuse now grew by the depopulation of other cities conquered by Gelon He gave citizenship both to mercenaries (Diod, xi 73) and to settlers from old Greece (Paus, v 27, 16, 17, Pind, *Olymp*, vi), so that Syracuse became a city of mingled race, in which the new citizens had the advantage The town spread to the mainland the new town of Achradina, with separate fortifications, arose on the eastern part of the adjoining peninsula (Diod, xi 73), while Ortygia became the inner city, the stronghold of the ruler Indeed in the form of unwalled suburbs the city seems to have spread even beyond Achradina (Diod, xi 61, 68, 72) Gelon's general rule was mild, and he won fame as the champion of Hellas by his great victory over the Carthaginians at Himera He is said to have been greeted as king, but he does not seem to have taken the title in any formal way

Gelon's brother and successor Hiero (478-467) kept up the power of the city, he won himself a name by his encouragement of poets and philosophers, and his Pythian and Olympian victories made him the special subject of the songs of Pindar He appeared also as a Hellenic champion in the defence of Cumæ, and he attempted to found a Syracusan colony on the island of Ænaria, now Ischia But his internal government, unlike that of Gelon, was suspicious, greedy, and cruel After some family disputes the power passed to his brother Thrasybulus, who was driven out next year by a general rising (see SICILY, p 16) In this revolution Thrasybulus and his mercenaries held the fortified quarters of Ortygia and Achradina, the revolted people held the unwalled suburbs, already, it is plain, thickly inhabited Thrasybulus yielded to the common action of Siceliots and Sicels Syracuse again became a free commonwealth, and, as the effect of the tyranny had been to break down old distinctions, it was now a democratic commonwealth Renewed freedom was celebrated by a colossal statue of Zeus Eleutherius and by a yearly feast in his honour But when the mercenaries and other new settlers were shut out from office[1] new struggles arose The mercenaries again held Ortygia and Achradina The people now walled in the suburb of Tyche to the west of Achradina (Diod, xi 73) The mercenaries were at last got rid of in 461 Although we hear of attempts to seize the tyranny and of an institution called *petalism*, like the Athenian ostracism, designed to guard against such dangers, popular government was not seriously threatened for more than fifty years The part of Syracuse in general Sicilian affairs has been traced in the article SICILY (*q v*), but one striking scene is wholly local, when the defeated Ducetius took refuge in the hostile city (451), and the common voice of the people bade "spare the suppliant" We have but one solitary notice of the great military and naval strength of Syracuse in 439 (Diod, xii 30) Yet all that we read of Syracusan military and naval action during the former part of the Athenian siege shows how Syracuse had lagged behind the cities of old Greece, constantly practised as they were in warfare both by land and sea

The Athenian siege (415-413) is of the deepest importance for the topography of Syracuse, and it throws some light on the internal politics Hermocrates, the best of counsellors for external affairs, is suspected, and seemingly with reason, of disloyalty to the democratic constitution Yet he is, like Nicias and Phocion, the official man, head of a board of fifteen generals, which he persuades the people to cut down to three Athenagoras, the demagogue or opposition speaker, has the best possible exposition of democratic principles put into his mouth by Thucydides (vi 36-40). Through the whole siege[2] there was a treasonable party within the city, which—for what motive we are not told—kept up a correspondence with the besiegers

The speech of Athenagoras is that of a very clever demagogue, it sums up very forcibly all that can be said against oligarchy, and it may have been perfectly sincere But his views were overruled, and preparation was made in earnest for the city's defence When the Athenian fleet under Nicias and Lamachus was at Rhegium in Italy, the question for the commanders was whether they should seek to strengthen themselves by fresh alliances on the spot or strike the blow at once Lamachus was for immediate action, and there can hardly be a doubt that Syracuse must have fallen before a sudden attack by so formidable an armament in the summer of

Ge... suc... sor

At... sie...

[1] Diod, xi. 72, cf Arist, *Pol.*, v 3, 10, and Grote's note, v. 319

[2] The chief authorities for the siege are Thucydides (bks. vi and vii), Diodorus (bk. xiii), and Plutarch, *Life of Nicias*

415 The Syracusans were neither at unity among themselves nor by any means adequately prepared for effectual defence Throughout the whole struggle it is perfectly clear that they owed their final deliverance to the most extraordinary good fortune Athens had the prize within her grasp, and she lost it wholly through the persistent dilatoriness and blundering of her general, the desponding, vacillating Nicias It was at his advice that the summer and autumn of 415 were frittered away and the siege not begun till the spring of 414 By that time the Syracusans were both in better spirits and better prepared their troops were better organized, and they had built a wall from the Great Harbour to Panagia so as to screen them from attack on the side of Epipolæ on the north-west The effect of this was to bar the enemy's approach and push back his blockading lines, which had to be carried over an inconveniently large extent of ground The Syracusans had been at first thoroughly cowed, but they were cowed no longer, and they even plucked up courage to sally out and fight the enemy on the high ground of Epipolæ They were beaten and driven back, but at the suggestion of Hermocrates they carried a counter work up the slope of Epipolæ, which, if completed, would cut in two the Athenian lines and frustrate the blockade At this point Nicias showed considerable military skill The Syracusans' work was destroyed by a prompt and well-executed attack, and a second counter work carried across marshy ground some distance to the south of Epipolæ and near to the Great Harbour was also demolished after a sharp action, in which Lamachus fell However, the blockade on the land side was now almost complete, and the Athenian fleet had at the same time entered the Great Harbour The citizens began to think of surrender, and Nicias was so confident that he neglected to push his advantages He left a gap in his lines at the point where Epipolæ slopes down to the sea, and he omitted to occupy an important position on its north-western ridge, known as Euryalus, a pass which commanded on this side the approach to the city from the interior

The second act of the drama may be said to open with the irretrievable blunder of Nicias in letting the Spartan Gylippus first land in Sicily, and then march at the head of a small army, partly levied on the spot, across the island, and enter Syracuse by way of Epipolæ, through the Euryalus pass Gylippus was felt to be the representative of Sparta, and of the Peloponnesian Greeks generally, and his arrival inspired the Syracusans with the fullest confidence Just before his arrival a few ships from Corinth had made their way into the harbour with the news that a great fleet was already on its way to the relief of the city The tables were now completely turned, and we hear of nothing but defeat and disaster for the besiegers till their final overthrow The military skill of Gylippus enabled the Syracusan militia to meet the Athenian troops on equal terms, to wrest from them their fortified position on Plemmyrium, and to reduce them to such a plight that as Nicias said in his despatch to Athens towards the close of 414, they were themselves besieged rather than besieging In the spring of the following year Syracuse once again gave herself up for lost, when seventy three warships from Athens, under Demosthenes, entered the harbour with a large force of heavy infantry and light troops Demosthenes decided at once to make a grand attack on Epipolæ, with a view to recovering the Athenian blockading lines and driving the Syracusans back within the city walls The assault was made by night, by the uncertain light of the moon, and this circumstance turned what was very nearly a successful surprise into a ruinous defeat The affair seems to have been well planned up to a certain point, and well executed, but the Athenian van, flushed with a first success, their ranks broken and disordered by a pursuit of the enemy over rough ground, were repulsed with great loss by a body of heavy armed Bœotians, and driven back in disorder The confusion spread to the troops behind them, and the action ended in a wild flight through the narrow roads and passes of Epipolæ The army was now thoroughly out of heart, and Demosthenes was for at once breaking up the camp, embarking the troops, and sailing back to Athens. But Nicias could not bring himself to face the Athenian people at home, nor could he be prevailed on to retire promptly to some position on the coast, such as Catana or Thapsus, where the army would be at least able to maintain itself for a time He dallied till the end of August, many weeks after the defeat, and on the 27th of that month was an eclipse of the moon, on the strength of which he insisted on a delay of almost another month His fleet too lingered uselessly in the harbour, till, after a frantic effort to break out and a desperate conflict, it was utterly defeated and half destroyed The broken and demoralized army, its ranks thinned by fever and sickness, at last began its hopeless retreat in the face of the numerous Syracusan cavalry, and, after a few days of dreadful suffering, was forced to lay down its arms The Syracusans sullied the glory of their triumph by huddling their prisoners into their stone-quarries,—a living death, dragged out, for some of them at least, to the space of seventy days

Her great deliverance and victory naturally stirred up the energies of Syracuse at home and abroad Syracusan ships under Hermocrates now play a not unimportant part in the warfare between Sparta and Athens on the coast of Asia Under the influence of Diocles the constitution became a still more confirmed democracy, some at least of the magistracies being filled by lot, as at Athens (Diod, xiii 31, 35, Arist, *Pol*, v 3 6) Diocles appears also as the author of a code of laws of great strictness, which was held in such esteem that later lawgivers were deemed only its expounders There seems no reason to suppose, with Holm, an earlier lawgiver Diocles distinct from the demagogue, but the story of his death by his own hand to punish a breach of his own law is, we may suspect, a repetition of the story of Charondas (Diod, xiii 33, cf xii 19) Under these influences Hermocrates was banished in 409, he submitted to the sentence, notwithstanding the wishes of his army He went back to Sicily, warred with Carthage on his own account, and brought back the bones of the unburied Syracusans from Himera, but was still so dreaded that the people banished Diocles without restoring him In 407 he was slain in an attempt to enter the city, and with him was wounded one who was presently to outstrip both rivals

Diocles and Hermocrates

This was Dionysius, son of another Hermocrates, and an adherent of the aristocratic party, but soon afterwards a demagogue, though supported by some men of rank, among them the historian Philistus (Diod, xiii 91, 92) By accusing the generals engaged at Gela in the war against Carthage, by obtaining the restoration of exiles, by a variety of tricks played at Gela itself, he secured his own election, first as one of the generals, then as sole general (or with a nominal colleague) with special powers He next, by another trick, procured from a military assembly at Leontini a vote of a bodyguard, he hired mercenaries and in 406-5 came back to Syracuse as tyrant of the city (Diod, xiii 91 96) Dionysius kept his power till his death thirty-eight years later (367) But it was wellnigh overthrown before he had fully grasped it His defeat before Gela (see SICILY, p 18) was of course turned against him His enemies in the army, chiefly the horsemen, reached Syracuse before him, plundered his house—he had not yet a fortress—and horribly maltreated his wife, but they took no political or military steps against himself He came and took his vengeance, slaying and driving out his enemies, who established themselves at Ætna (Diod, xiii 113) This revolution and the peace with the Carthaginians confirmed Dionysius in the possession of Syracuse, but of no great territory beyond, as Leontini was again a separate city It left Syracuse the one great Hellenic city of Sicily, which, however enslaved at home, was at least independent of the barbarian Dionysius was able, like Gelon, though with less success and less honour, to take up the part of the champion of Hellas

Dionysius the Elder

During the long tyranny of Dionysius the city grew greatly in size, population, and grandeur Plato says (*Epist*, vii) that he gathered all Sicily into it In fact the free Greek cities and communities, in both Sicily and southern Italy, were sacrificed to Syracuse, there the greatness and glory of the Greek world in the West were concentrated The mass of the population of Gela and Camarina in the disastrous year 405 had, at the prompting of Dionysius, taken refuge at Syracuse Gela had in the previous year received the fugitive inhabitants of Acragas (Agrigentum), which had been sacked by the Carthaginians Syracuse thus absorbed three of the chief Greek cities of Sicily It received large accessions from some of the Greek cities of southern Italy, from Hipponium on its west and Caulonia on its east coast, both of which Dionysius captured in 389 B C There had also been an influx of free citizens from Rhegium At the time of the Athenian siege Syracuse consisted of two quarters—the Island and the "outer city" of Thucydides, generally known as Achradina, and bounded by the sea on the north and east, with the adjoining suburb of Apollo Temenites farther inland at the foot of the southern slopes of Epipolæ With the vast increase in its population, it now grew

Quarters of the city

into a city of four quarters The suburb Temenites was expanded into Neapolis (New Town), spreading over the adjoining slopes A district stretching down to the sea, to the north west of Achradina, was taken in, and subsequently enlarged into a separate fortified town Tyche (Τύχη) was the name given to this quarter, according to Cicero (*In Verr*, iv 52, 53) from an old temple of Fortune somewhere within its limits,—a fact which seems to indicate that the spot must have been inhabited in very early times But of this Thucydides says nothing, and his silence on a point which would have naturally entered into his description of the Athenian blockading operations is somewhat perplexing This quarter was in Cicero's time the most populous part of the entire city, it was practically secured by the new city walls, which were drawn inland in a triangular form so as to enclose the hill of Epipolæ, the apex of the triangle being the fortress of Euryalus, the remains of which are said to be the most perfect existing specimen of ancient fortification Syracuse was now secure on the land side The Island (Ortygia) had been provided with its own defences, converted in fact into a separate stronghold, with a fort to serve specially as a magazine of corn, and with a citadel or acropolis which stood apart, and might be held as a last refuge Dionysius, to make himself perfectly safe, drove out a number of the old inhabitants and turned the place into barracks for his soldiers, he himself living in the citadel For any unpopularity he may have thus incurred he seems to have made up by his great works for the defence of the city, these were executed under the direction of the most skilful engineers, and are said to have found employment for 60,000 men The new lines covered an extent of 3½ miles, and were constructed of huge well cut blocks of stone from the neighbouring quarries Each quarter of the city had its own distinct defences, and Syracuse was now the most splendid and the best fortified of all Greek cities Its naval power, too, was vastly increased, the docks were enlarged, and 200 new warships were built Besides the triremes, or vessels with three banks of oars, we hear of quadriremes and quinqueremes with four and five banks of oars,—larger and taller and more massive ships than had yet been used in Greek sea warfare The fleet of Dionysius was the most powerful in the Mediterranean It was doubtless fear and hatred of Carthage, from which city the Greeks of Sicily had suffered so much, that urged the Syracusans to acquiesce in the enormous expenditure which they must have incurred under the rule of Dionysius Much too was done for the beauty of the city as well as for its strength and defence Several new temples were built, and gymnasia erected outside the walls near the banks of the Anapus (Diod, xv 13)

Diony-sius the Younger "Fastened by chains of adamant" was the boastful phrase in which Dionysius described his empire; but under his son, the younger Dionysius, an easy, good-natured, unpractical man, a sort of cleverish dilettante, a reaction set in amongst the restless citizens of Syracuse, which, with its vast and mixed population, must have been full of elements of turbulence and faction But the burdensome expenditure of the late reign would be enough to account for a good deal of discontent A remarkable

Dion man now comes to the front,—Dion, the friend and disciple of Plato, and for a time the trusted political adviser of Dionysius, whom he endeavoured to impress with a conviction of the infinite superiority of free and popular government to any form of tyranny or despotism Dion's idea seems to have been to make Dionysius something like a constitutional sovereign, and with this view he brought him into contact with Plato All went well for a time, but Dionysius had those about him who were opposed to any kind of liberal reform, and the result was the banishment of Dion from Syracuse as a dangerous innovator Ten years afterwards, in 357, the exile entered Achradina a victor, welcomed by the citizens as a deliverer both of themselves and of the Greeks of Sicily generally As yet, however, this was the only part of the city gained A siege and blockade, with confused fighting and alternate victory and defeat, and all the horrors of fire and slaughter, followed, till Dion made himself master of the mainland city. Ortygia, however, was still held by Dionysius; but, provisions failing, it also was soon surrendered. Dion's rule lasted only three years, for he perished in 354 by the hand of a Syracusan assassin It was, in fact, after all his professions, little better than a military despotism The tyrant's stronghold in the Island was left standing, and Dion actually opposed a proposal for its destruction The man who won immense popularity by the proposal was murdered, and Dion seems to have been an accomplice in the crime

Of what took place in Syracuse during the next ten years we know but little The younger Dionysius came back and from his island fortress again oppressed the citizens, the plight of the city, torn by faction and conflicts and plundered by foreign troops, was so utterly wretched that all Greek life seemed on the verge of extinction (Plato, *Epist*, viii) Sicily, too, was again menaced by Carthage Syracuse, in its extremity, asked help from the mother-city, Corinth, and now appears on the scene one of the noblest figures in Greek history, Timoleon (*q v*) To him Syracuse owed her deliverance from the younger Dionysius and from the rule of despots, and to him both Syracuse and the Sicilian Greeks owed a decisive triumph over Carthage and the safe possession of Sicily west of the river Halycus, the largest portion of the island From 343 to 337 he was supreme at Syracuse, with the hearty goodwill of the citizens The younger Dionysius had been allowed to retire to Corinth, his island fortress was destroyed and replaced by a court of justice Syracuse rose again out of her desolation—grass, it is said, grew in her streets—and, with an influx of a multitude of new colonists from Greece and from towns of Sicily and Italy, once more became a prosperous city Timoleon, having accomplished his work, accepted the position of a private citizen, though, practically, to the end of his life he was the ruler of the Syracusan people After his death (337) a splendid monument, with porticoes and gymnasia surrounding it, known as the Timoleonteum, was raised at the public cost to his honour Timo-leon

In the interval of twenty years between the death of Timoleon and the rise of Agathocles to power another revolution at Syracuse transferred the government to an oligarchy of 600 leading citizens All we know is the bare fact It was shortly after this revolution, in 317, that Agathocles with a body of mercenaries from Campania and a host of exiles from the Greek cities, backed up by the Carthaginian Hamilcar, who was in friendly relations with the Syracusan oligarchy, became tyrant or despot of the city, assuming subsequently, on the strength of his successes against Carthage, the title of king Syracuse passed through another reign of terror; the new despot proclaimed himself the champion of popular government, and had the senate and the heads of the oligarchical party massacred wholesale. This man of blood seems to have had popular manners, and to have known how to flatter and cajole, for a unanimous vote of the people gave him absolute control over the fortunes of Syracuse. His wars in Sicily and Africa left him time to do something for the relief of the poorer citizens at the expense of the rich, as well as to erect new fortifications and public buildings, and under his strong government Syracuse seems to have been at least quiet and orderly After his death in 289 comes another miserable and obscure period of revolution and despotism, in which Greek life was dying out; and but for the brief intervention of Pyrrhus in 278 Syracuse, and indeed all Sicily, would have fallen a prey to the Carthaginians Agatho-cles

A better time began under Hiero II., who had fought under Pyrrhus and who rose from the rank of general of the Syracusan army to be tyrant—king, as he came to be soon styled—about 270. During his reign of over fifty years, ending probably in 216, Syracuse enjoyed tranquillity, and seems to have grown greatly in wealth and population Hiero's rule was kindly and enlightened, combining good order with a fair share of liberty and self-government His financial legislation was careful and con- Hiero

siderate, his laws [1] as to the customs and the corn tithes were accepted and maintained under the Roman government, and one of the many bad acts of the notorious Verres, according to Cicero, was to set them aside (Cic, *In Verr*, ii 13, iii 8) It was a time too for great public works,—works for defence at the entrance of the Lesser Harbour between the Island and Achradina, and temples and gymnasia Hiero through his long reign was the staunch friend and ally of Rome in her struggles with Carthage, but his paternal despotism, under which Greek life and civilization at Syracuse had greatly flourished, was unfortunately succeeded by the rule of a man who wholly reversed his policy

Hieronymus

Hieronymus, the grandson of Hiero, thought fit to ally himself with Carthage, he did not live, however, to see the mischief he had done, for he fell in a conspiracy which he had wantonly provoked by his arrogance and cruelty There was a fierce popular outbreak and more bloodshed the conspirators were put to death and Hiero's family was murdered, whilst the Carthaginian faction, under the pretence of delivering the city from its tyrants, got the upper hand and drew the citizens into open defiance of Rome Marcellus was then in command of the Roman army in Sicily, and he threatened the Syracusans with attack unless they would get rid of Epicydes and Hippocrates, the heads of the anti-Roman faction Epicydes did his best to stir up the citizens of Leontini against Rome and the Roman party at Syracuse Marcellus therefore struck his first blow at Leontini, which was quickly stormed, and the tale of the horrors of the sack was at once carried to Syracuse and roused the anger of its population, who could not but sympathize with their near neighbours, Greeks like themselves The general feeling was now against any negotiations with the Roman general, and, putting themselves under Epicydes and Hippocrates, they closed their gates on him Marcellus, after an unsuccessful attempt to negotiate, began the siege in regular form (214 B C) by both land and sea, establishing a camp on Polichne, where stood the old temple of Olympian Zeus, but he made his chief assault on the northern side and on the defences of Tyche, particularly at the Hexapylum, the entrance facing Megara and Leontini His assault seawards was made mainly on Achradina, but the city was defended by a numerous soldiery and by what seem to have been still more formidable, the ingenious contrivances of Archimedes, whose engines dealt havoc among the Roman ships, and frustrated the attack on the fortifications on the northern slopes of Epipolæ (Liv, xxiv 34) Marcellus had recourse to a blockade, but Carthaginian vessels from time to time contrived to throw in supplies At length treachery began to work within Information was given him in the spring of 212 (two years from the commencement of the siege) that the Syracusans were celebrating a great festival to Artemis; making use of this opportunity, he forced the Hexapylum entrance by night and established himself in Tyche and on the heights of Epipolæ The strong fortress of Euryalus held out for a time, but, being now isolated, it soon had to surrender The "outer" and the "inner city" of Thucydides still held out, whilst a Carthaginian fleet was moored off Achradina and Carthaginian troops were encamped on the spot But a pestilence broke out in the autumn of 212, which swept them clean away, and thinned the Roman ranks The ships sailed away to Carthage, on their way back to Syracuse with supplies they could not get beyond Cape Pachynus owing to adverse winds, and they were confronted by a Roman fleet. All hope for the city being now at an end, the Syracusans threw themselves on the mercy of Marcellus, but Achradina and the Island still held out for a brief space under the Syracusan mercenaries, till one of their officers, a Spaniard, betrayed the latter position to the enemy, and at the same time Achradina was carried and taken Marcellus gave the city up to plunder (Liv, xxv 31), and the art treasures [2] in which it was so rich—many of the choicest of them no doubt—were conveyed to Rome From this time art seems to have become quite fashionable in certain Roman circles Archimedes perished in the confusion of the sack, while he was calmly pursuing his studies (Liv, xxv 31)

Siege by Marcellus

Under Rome

Syracuse was now simply one of the provincial cities of Rome's empire, and its history is henceforward merged in that of Sicily It retained much of its Greek character and many of its finest public buildings, even after the havoc wrought by Marcellus Its importance and historic associations naturally marked it out as the residence of the Roman prætor or governor of Sicily Cicero often speaks of it as a particularly splendid and beautiful city, as still in his own day the seat of art and culture [3] (*Tusc*, v 66, *De Deor Nat*, iii 81, *De Rep*, i 21), and in his speeches against Verres (iv 52, 53) he gives an elaborate description of its four quarters (Achradina, Neapolis, Tyche, the Island), or rather the four cities which composed it It seems to have suffered in the civil wars at the hands of Sextus Pompeius, the son of the triumvir, who for a short time was master of Sicily, to repair the mischief, new settlers were sent by Augustus in 21 B C, and established in the Island and in the immediately adjoining part of Achradina (Strabo, vi 270, ed Kramer) It is in these districts that the remains of Roman works—of amphitheatres and other public buildings—are mainly to be traced We hear nothing of any importance about Syracuse during the period of the empire It had its own senate and its own magistrates [4] Caius Caligula restored its decayed walls and some of its famous temples (Suetonius, *Caius*, 21) Tacitus, in a passing mention of it (*Ann*, xiii 49), says that permission was granted to the Syracusans under Nero to exceed the prescribed number of gladiators in their shows Hence the city by that time must have been provided with an amphitheatre In the 4th century it is named by the poet Ausonius in his *Ordo Nobilium Urbium*, chiefly, perhaps, on the strength of its historic memories

Modern town

Modern Syracuse is confined to the island of Ortygia, and is only about $2\frac{1}{2}$ miles in circumference The island is irregularly oval in shape, and extends from north to south on the east side of the fine natural harbour, the Porto Grande (*Magnus Portus*) On the north it is connected with the mainland by a dyke or narrow isthmus, and between the southern extremity and the opposite peninsula of Massolivieri, the ancient Plemmyrium, there is a stretch of 1300 yards, forming the entrance to the harbour The approach to the town from the mainland is defended by a dilapidated citadel of the time of Charles V, and the southern extremity is occupied by a castle named after George Maniaces, the last Byzantine general by whom it was held in the 11th century before it fell into the hands of the Saracens The town is further defended by walls with bastions The streets are in general narrow, and their chief feature consists in their numerous convents with wooden latticed windows One tolerably wide and handsome street crosses the island from east to west Besides the fortifications, the principal objects of interest are the cathedral of Santa Maria delle Colonne (the ancient temple of Minerva), adjoining which is the archiepiscopal residence, the archæological museum, the finest works preserved in which are a statue of Venus in Parian marble and a colossal head of Zeus, and the fountain of Arethusa, which still bubbles up as clear and abundant as ever on the west side of the island Its waters, however, are no longer drinkable, an earthquake in 1170 having allowed the sea water to become mingled with them From the neighbourhood of this fountain a favourite promenade extends northwards along the shore of the Porto Grande

Syracuse has been a place of little importance since the year 878 when it was destroyed by the Saracens under Ibrahim ibn Ahmed

[1] The laws of Hiero are often mentioned with approval in Cicero's speeches against Verres

[2] Statues and pictures are particularized by Livy, xxv 40

[3] The poets Theocritus and Moschus were Syracusans

[4] Local self government, in fact, like most of the Greek cities

Since that date the mainland portion of the city has never been rebuilt. Syracuse is the seat of an archbishop, and since 1865 has been the capital of a province, which takes its name from the town. The inhabitants manufacture drugs and other chemical articles, earthenware, &c., and carry on a considerable trade, principally in wine. In 1885 785 vessels of 21,818 tons entered the port and 778 vessels of 21,480 tons cleared. At Syracuse Admiral de Ruyter died in 1676 after his defeat by the French at Agosta. The population in 1881 was 21,157.

See Hare, *Cities of Southern Italy and Sicily* (London, 1883).

SYRACUSE, a city of the United States, the county seat of Onondaga county, New York, 148 miles west of Albany, midway between that city and Buffalo. Syracuse is situated near the southern end of Onondaga Lake (5 miles long by 1 broad), whose waters flow northwards through Seneca and Oswego rivers into Lake Ontario at Oswego. The Erie Canal, flowing east and west, joins the Oswego Canal within the city. Syracuse contains several handsome public buildings,—the county court-house, the United States Government building, the city-hall, the State asylum for idiots, the Onondaga penitentiary, the county orphan asylum, the asylum of St Vincent de Paul, the high school (containing the central library of 15,000 volumes), a State armoury, &c. Syracuse is the seat of a (Methodist) university, founded in 1870 and consisting of a college of the liberal arts, a college of the fine arts, and a college of physicians and surgeons. The salt industry, to which Syracuse owed much of its early prosperity, is still the staple; the springs situated near the southern end of Lake Onondaga, which appears to be the remains of a once very extensive basin, have been under State control since 1797. Previous to the opening of the Michigan springs they were the largest in the United States, and they still yield on an average from 7,000,000 to 8,000,000 bushels of salt per annum. Rolling-mills, furnaces, steel-works, glass-works, breweries, and manufactories of barrels, agricultural machinery, and clothing are among the secondary industrial establishments. At the completion of the Erie Canal in 1825 Syracuse had only 300 inhabitants; by 1855 they were 25,107, and in 1860, 1870, and 1880 respectively they numbered 28,119, 43,051, and 51,792; in 1886 the number had risen to 81,000, including some adjacent villages recently annexed.

By some investigators it is believed that Lake Onondaga was De Soto's "silver bottomed" lake. The great tribal fortress of the Onondagas on the east side of the lake near the spot now occupied by Liverpool was attacked without success by Champlain in 1615. The first house on the site of Syracuse was built in 1805. The village, to which the name of Syracuse had been given in 1824, was incorporated in 1825, and the city in 1847.

SYR-DARIA (Gr. and Lat. *Jaxartes*, Arab. *Shash* or *Sihun*), a river flowing into the Sea of Aral, and having a length of 1500 miles and a drainage area of about 320,000 square miles. Incertitude as to its source prevailed until the recent occupation of Turkestan by the Russians. It has now been traced to the Naryn, which has its sources in the heart of the Tian-Shan complex, some 30 miles south of Lake Issik-kul, in the elevated valleys or *syrts* (12,000 feet) on the southern slope of the Terskei Ala-tau. Here under the name of Jaak-tash the river takes its rise amid mountain scenery of the wildest description, partly from the marshy mountain plateaus by which the "Warm Lake" is also fed, and partly from the immense glaciers of the dark and barren Ak-shiriyak Mountains (Petroff and Sir-tash glaciers). After its union with another mountain stream, the Barskaun, it is called the Taragai, and flows west-south-west at from 11,000 to 10,000 feet above the sea, in a barren longitudinal valley between the Terskei Ala-tau and the foothills of the lofty Kokshal-tau. On entering a wild narrow gorge driven from west to east through the south-west continuation of the Terskei Mountains (Samatyn-tau) it receives the name of Naryn. Through this gorge it descends by a series of rapids from the heights of the mountain *massif* to a deep valley of the alpine region, its level at its issue from the gorge being reduced by fully 4000 feet. Fort Narynsk, 20 miles below the junction of the Great and the Little Naryn, is only

Map[1] of Syr-Daria.

6800 feet above the sea. Here the river enters a broad valley—formerly the bottom of an alpine lake—and flows past the ruins of Fort Kurtka, for 90 miles westward, as a stream some 50 yards wide and from 3 to 11 feet deep. Its waters are utilized for irrigating Kirghiz corn-fields, which contrast strangely with the barren aspect of the lofty treeless mountains. The Atpasha—a large mountain stream—joins the Naryn at the head of this valley and the Atabuga at its lower end, both from the left. Before reaching the lowlands, the Naryn crosses three ridges separating the valley of Kurtka from that of Ferghana, by a series of wild gorges and broad valleys (170 miles), representing the bottoms of old lakes; the Togus-torgau, 2000 feet lower than Kurtka, and the Ketmen-tube are both covered with Kirghiz corn-fields. Taking a wide sweep towards the north, the river enters Ferghana—also the bottom of an immense lake—where, after joining the Kara-Daria (Black river) near Namangan, it receives the name of Syr-Daria.[2] The Kara-Daria is a mighty stream rising in the north-eastern spurs of the Alai Mountains. As it deflects the Naryn towards the west again, the natives consider it the chief branch of the Syr-Daria, but its volume is much smaller. At the confluence the Syr is 1110 feet above sea-level.

The waters of the Syr-Daria and its tributaries are in this part of its course largely absorbed by numberless canals for irrigation. It is to the Syr that Ferghana is indebted for its high, if somewhat exaggerated, repute in Central Asia as a rich garden and granary; cities like Khokand, Marghilan, and Namangan, and more than 800,000 inhabitants of the former khanate of Khokand, live by its waters. Notwithstanding this drain upon it, the Syr could be easily navigated, were it not for the Bigovat rapids at Irdjar, at the lower end of the valley, where the river finds its way to the Aral-Caspian deserts by piercing a depression of the Mogol-tau.

On issuing from this gorge the Syr enters the Aral depression, and flows for 850 miles in a north-westerly and northerly direction before reaching the Sea of Aral. On this section it is navigated by steamers. Between the Irdjar rapids and Baildyr-turgai (where it bends north) the Syr flows along the base of the mountain ridges which girdle the Tchotkal Mountains (see below) on the north-west, and receives from the longitudinal valleys of these alpine tracts a series of tributaries (the Angren, the Tchirtchik, the Keles), which in their lower courses fertilize the wide plains of loess extending from the right bank of the Syr. These plains and their rich supply of water have been the

[1] Reduced from Mushketoff's "Geological Map of the Turkestan Basin," in his *Turkestan* (Russian), 1886, vol. i.

[2] *Syr* and *daria* both signify "river," in two different dialects.

cause of an oasis of Moslem civilization developing between the barren sands of the Aral depression and the mountain tracts of the Tian-Shan. The Angren rises beneath the highest parts of the Tchotkal range, and its valley is the granary of the region. The Tchirtchik has its origin in the Boroldav Mountains at the junction of the Tchotkal and the Pskem rivers, and at the point where it issues from the mountains it sends off the famous canal Zakh-aryk; it flows past Tashkend along a valley 20 miles wide, and joins the Syr a few miles below its confluence with the Angren. The Keles comes from the Jity-su Mountains and also brings a large volume of water for irrigation. But owing to wars and continual insecurity cities formerly important have now been abandoned; and near Tchinaz, at the mouth of the Tchirtchik, are the ruins of a large town formerly fortified with high walls, and of *aryks* with manifold ramifications.

Some 50 miles below Tchinaz (770 feet above sea-level) the Syr bends northwards, but resumes its north-westerly course 150 miles farther down, following with remarkable persistency the borders of the loess which fringes the mountains. Its low banks, covered with rushes and rendered uninhabitable in summer by clouds of mosquitoes, are inundated for 20 miles on both sides when the snows begin to melt. These inundations prevent the moving sands of the Kizil-kum desert from approaching the Syr; below Perovsk, however, the steppe gains the upper hand. Down to Perovsk the river rolls its muddy yellow waters, at the rate of 3 to 5 miles an hour, in a channel 300 to 600 yards wide and 3 to 5 fathoms deep; at Perovsk its vertical section is 8220 square feet, and 312,500 cubic feet of water are discharged per second. The Arys and the Buguñ are the only tributaries worthy of notice on this part of its course; the other streams which descend from the Kara-tau fail to reach the river. The Kungrad Kirghiz rear numerous herds of cattle and sheep in the valley of the Arys, while lower down, as far as Julek, the Igintchis carry on agriculture. All this applies, of course, only to the right bank; on the left the moistness is absorbed by the hot winds which cross the Kizil-kum sands towards the river. The dryness of the atmosphere makes its influence markedly felt on the Syr when it enters, below Julek, a region where the Kara-kum sands extend on its right. Ten miles below Perovsk the river traverses a marshy depression—the bottom of a lake not yet fully dried up—where it divides into two branches,—the Jaman-daria and the Kara-uzyak. The latter spreads out in marshes and ponds, from which it again issues to join the former at Karmaktchi, after a course of 80 miles. The main branch also, owing to its shallowness and sinuosity, is very difficult to navigate, and this is increased by the rapidity of the current and the want of fuel. Between Kazalinsk and the Sea of Aral (158 feet) the navigation becomes somewhat easier, except for the last 10 miles, where the river divides into three shallow branches before entering the "Blue Sea." All three have at their mouths sandy bars with only 3 feet of water, which are often forded by the Kirghiz.

Two former right hand tributaries of the Syr—the Tchu and the Sary-su—which now disappear in the sands some 60 miles before reaching it, must be mentioned. The Tchu, which is 600 miles in length, rises in the Tian-Shan to the south-west of Lake Issik-kul, and is made up of many streams, of which the Kyz-art, the Juvan-aryk, and the Koshkar are the more important. On their union these form the Koshkar, which flows towards Lake Issik-kul, but a few miles before reaching that lake turns suddenly to the north-west, enters under the name of Tchu the narrow gorge of Buam, and, piercing the snow-clad Kunghei Ala-tau, emerges on its northern slope, having descended from 5500 feet to less than 2000 in a course of not more than 50 miles. In this part of its course it receives from the right the Kebin, whose high valley equals in size that of the upper Rhone. It then flows north-westwards through the valley of Pishpek, and, avoiding the Muyun-kum sands, describes a wide curve to the north before finally taking a western direction. Numberless streams flow towards it from the snow-clad Alexandrovsk Mountains, but they are for the most part lost in the sands before reaching it. The Talas, 170 miles long, formerly an affluent of the Tchu, which rises in the highest parts of that range, pierces the Tcha-artcha Mountains, and, flowing past Aulie-ata on the south border of the Muyun-kum, enters the salt lake Kara kul 60 miles from the Tchu. The Tchu reaches the Saumal-kul group of lakes, 60 miles from the Syr, in the form of marshes with undefined channels. Another elongated group of lakes—the Uzun kul—near the above and 50 miles from Perovsk, receives the Sary-su, which has a length of nearly 570 miles, and flows rapidly in a narrow channel along the west borders of the northern Famine Steppe (Bekpak-dala).

The delta of the Syr at present begins at Perovsk, whence it sends a branch to the south west, the Yany daria (Jany-daria or New river), which formerly reached the south-eastern corner of the Sea of Aral, very near the mouth of the Amu-daria. The Kirghiz affirm that a canal dug for irrigation by the Karakalpaks gave origin to this river. It had, however, but a temporary existence. A dam erected by the Khokandese at Ak metchet (Perovsk) caused its disappearance, and the Russians found but a dry bed in 1820. When the dam was removed the Yany-daria again reappeared but it failed to reach the Sea of Aral; in 1853 it lost itself in Lake Kutchka-denghiz, after a course of 250 miles; all traces of its bed were then lost in the sand. The Kirghiz legend can only be accepted, however, with very great caution; the present writer is inclined to think that the canal of the Karakalpaks was merely intended to redirect the waters of the Syr into a channel which existed of old, but had been dried up.[1] Certain it is that five centuries ago, in the time of Timur, the Yany-daria brought the waters of the Syr to the Dau kara Lakes, close by the present mouth of the Amu. The series of old beds in the Kizil kum, which are still seen above Perovsk, shows that the Syr had a constant tendency to seek a channel to the south-west and that its present delta is but a vestige of what it was in past times. At a still more remote period this delta probably comprised all the space between the Kara tau and the Nura-tau; and in the series of elongated lakes at the base of the Nura-tau—the Tuz-kane and Bogdan-ata Lakes—we see an old branch of the delta of the Syr which probably joined the Zerafshan before reaching the Amu. The causes of this immense change are to be sought for simply in the rapid desiccation of the whole northern and central parts of Asia, due to the fact that we are now living in the later phase of the Lacustrine period, which has followed the Glacial period. The extremely rapid desiccation of the Sea of Aral is proved even by surveys a few decades old, and this process is but a trifle in comparison with the changes which have taken place during the last five centuries: the extension of the Caspian Sea as far as the Sarakamysh lakes during the Post Pliocene period and the extension of the Sea of Aral at least 100 miles to the east of its present banks are both proved by the presence of Post-Pliocene marine deposits. (P. A. K.)

SYR-DARIA, or SYR-DARIINSK, a province of Russian Turkestan, in Asia, comprising wide tracts of land on both sides of the Syr-Daria river, from its entrance into the Sea of Aral up to Khojend, where it issues from the mountain region of the Tian-Shan. It is bounded on the N. by the Russian provinces of Turgai and Akmolinsk, on the E. by Semiryetchensk and Ferghana (ex-khanate of Khokand), on the S. by the district of Zerafshan, Bokhara, and the Russian province of Amu-daria, and on the W. by the Sea of Aral. Its area (166,000 square miles), its population (more than one million inhabitants), and its cities (Tashkend, Khojend, Jizak, &c.) make it the most important province of Russian Turkestan; and from its position between the mountain region of Central Asia and the great lake of the west Asian depression it is a region of deep interest for the geographer and geologist.

The south-eastern border of the province runs along the lofty Tchotkal Mountains. This chain, which separates the river Tchotkal from the Naryn, and runs for more than 200 miles from south-west to north-east, joining Alexandrovsk Mountains on the east, raises its snow-clad peaks to an altitude of 14,000 feet. It diminishes in height towards the south, not exceeding 7000 feet in the barren Mogol-tau Mountains, but seems to be continued to the south-west by the Baisun-tau. A series of shorter chains—

[1] For the old beds of the Syr and the Amu, see Kaulbars's "Lower Parts of the Amu," in *Mem. Russ. Geogr. Soc.*, Phys. Geogr., ix. (1881).

the Talas Ala-tau, the Bishelik, the Badam Mountains, the Kazyk-urt, and the Atym-tau—fringe the above on the north-west, and occupy the south-east corner of Syr-Dariinsk. The snowclad summits of the Talas Ala-tau range from 14,000 to 15,000 feet, and immense glaciers occur about Manas Mountain. So far as our maps show, the range seems to run from west-south-west to east-north-east. The other chains just mentioned have a decidedly south-westerly direction, and are much lower, the outlying ranges having rather the character of broad plateaus, above 2000 feet in height, where the Kirghiz find excellent pasture grounds. Some of them, such as the Kazyk-urt, rise as isolated mountains from the steppe, and have therefore been called Ararats. The Kara-tau is quite separate from the preceding and runs at right angles to them—that is, from north-west to south-east. It belongs therefore to another series of upheavals which prevails in western Asia and to which Richthofen has given the name of the "Kara-tau series." Its length is about 270 miles, and its average height about 5000 feet, rising at some points to 6000 and 7000 feet. It separates the Syr-Daria from the Tchu, and its gentle south-western slope contains the sources of a multitude of streams, which water the oasis around the town of Turkestan. Another range, having the same direction, from north-west to south-east, touches the southern border of Syr-Daria, namely, the Nura-tau (or Nuratyn-tau), also called Turkestan Mountains, which lifts its icy peaks (15,000 to 16,000 feet in height) abruptly from the steppe. It separates Syr-Daria from Zerafshan, and the passes by which it is crossed reach an altitude of from 10,000 to 13,000 feet. Finally, a few islands of metamorphic or granitic rock, called Ararats by the natives, stand isolated in the steppes.

The mountainous tracts occupy, however, only a small part of Syr-Daria; the rest of its wide surface is steppe. Three different areas must be distinguished,—the Kizil kum, the Muyun-kum or Ak kum, and the Kara kum ("black sands," so called more from their desert character than from their colour). The Kizil-kum (red sands) is the most interesting.[1] These sands occupy the wide stretch between the Amu and the Syr, and have a gradual ascent from 160 feet at the Sea of Aral to 1500 and 2000 feet in the south-east. They are covered with numerous folds or elongated dunes (*barkhans*), partly shifting partly stationary, 30 to 60 feet high, and mostly parallel to each other, amidst which are immense spaces covered with clay, and saline clays appear here and there on the surface. The Kizil kum varies much in its characteristics. Close by the Sea of Aral it is covered with shifting sands, the result of the disintegration of cretaceous sandstones; and every storm raises clouds of hot sand which render communication exceedingly difficult. But even there a rich verdure covers the undulations in spring. Farther east the sands lose their shifting character, and the barkhans are covered with a kind of *Carex*, which serves as excellent food for sheep. The *Holoxylon Anemodendron* grows extensively on the elevated ridges and yields fuel and charcoal, which last is exported to Bokhara. In the west the surface is covered with remains of Aral-Caspian deposits. As the Tian-Shan is approached the steppe takes another character: a thick covering of loess girdles the foothills and forms the fertile soil to which Turkestan is indebted for its rich fields and gardens.

The Kara kum sands, situated to the north-east of the Sea of Aral, are manifestly a former bottom of the lake. They are covered with debris of *Cardium edule*, *Mytilus*, *Dreissena polymorpha*, *Neritina litturata*, *Adacna vitrea*, *Hydrobia stagnalis*, with remains of marine *Algæ* (*Zostera*), and with fragments of *Scirpus* and *Phragmites*. The Kizil-kum is characterized by the presence of *Lithoglyphus caspius*, *H. stagnalis*, *Anodonta ponderosa*, and the sponge *Metchnikowia tuberculata*. The evil reputation of the Kara-kum has been exaggerated to some extent; the harsh things said of it apply only to the neighbourhood of the Sea of Aral. In the east the steppe has some vegetation and is readily visited by the Kirghiz. The barkhans do not shift, being covered with *Calligonum*, *Tamarix*, *Holoxylon Anemodendron*, and some rushes; shifting dunes 40 to 50 feet high occur, especially towards the Sea of Aral. The Muyun-kum or Ak kum Steppe, between the Kara-tau Mountains and the Tchu, is quite uninhabited, except in the loess region at the northern base of the mountains.

Granites, granulites, syenites, porphyries, and various metamorphic slates constitute the bulk of the western Tian-Shan Mountains. They appear also in the Kara-tau and Nura-tau, and sometimes in the form of isolated islands in the steppe. Silver and lead ores, as well as malachite and copper ore, are found in them, especially in the Mogol tau, and turquoises about Khojend. The crystalline rocks, much metamorphosed, especially in the west, are overlain by thick Devonian and Carboniferous deposits. Jurassic rocks (Rhætic) cover small areas on the slopes of the mountains. These last are all of fresh-water origin; hence it would seem that throughout the Jurassic and Triassic periods Turkestan was a continent intersected only by lagoons of the Jurassic sea. The Jurassic deposits are most important on account of their coal-beds, which occur in the basins of the Badam and Sairam and in Ferghana. Chalk and Tertiary marine deposits are superimposed upon the above to the thickness of 2000 to 5000 feet, and are widely spread, although they have suffered greatly from denudation. The former belong to the Upper (Ferghana deposits, much resembling Senonian) and Middle Chalk, and contain phosphorite, gypsum, and naphtha (in the Amu Daria basin). The Tertiary deposits, which contain gypsum and lignite, are represented by nummulitic sands around the Sea of Aral, and by Oligocene and Miocene (Sarmatic) deposits. In the Tian Shan the red Tertiary conglomerates (Pliocene?) attain a great development. Throughout the Chalk and earlier Tertiary periods the lowlands of Syr Daria were under the sea. The character of the region during the Post-Pliocene period remains unsettled. To what extent the mountains of the western Tian Shan were under ice during the Glacial period remains a subject of controversy among geologists; many deposits, however, have been described, even in the outer parts of mountain tracts, which have a decidedly Glacial character. A girdle of loess, varying in width from 30 to 50 miles, encircles all the mountain tracts, increasing in extent in Bokhara and at the lower end of the valley of Ferghana. It seems certain that during the Lacustrine period the Caspian was connected by a narrow gulf with the Aral basin, which was then much larger, while another inland sea of great dimensions covered the present Balkash basin, and at an earlier period may have been connected with the Aral basin. Recent traces of these basins are found in the steppes.

The chief river of the province is the SYR-DARIA (see above), with its tributaries. The frontier touches the eastern shore of the Sea of Aral, and numerous small lakes, mostly salt, are scattered over the sandy plains. A few lakes of alpine character occur in the valleys of the hilly tracts.

The climate of Syr Daria varies greatly in its different parts. It is most severe in the high treeless *syrts* of the mountain region, and in the lowlands it is very hot and dry. As a whole, the western parts of the Tian-Shan receive but little precipitation, and are therefore very poor in forests. In the lowlands the heat of the dry summer is almost insupportable, the thermometer rising to 111° Fahr. in the shade; the winter is severe in the lower parts of the province, where the Syr remains frozen for three months. The average yearly temperature at Tashkend and Kazalinsk respectively is 51° and 44° (January, 28° and 8°; July, 80° and 76°).

The flora and fauna belong to two distinct regions,—to Turkestan and to the Aral-Caspian depression (see TURKESTAN). The terraces of loess mentioned above are alone available for culture, and accordingly less than 1 per cent. (0.8) of the total area of the province is under crops, the remainder being either quite barren (57 per cent. of the surface) or pasture land (42 per cent.). Although cultivation is possible only in a few oases, it is there carried to great perfection owing to a highly developed system of irrigation,—two crops being gathered every year. Wheat and barley come first, then pease, millet, and lentils, which are grown in the autumn. Rye and oats are grown only about Kazalinsk. Cotton is cultivated in the districts of Khojend, Kurama, and Turkestan. Gardening is greatly developed. Sericulture is also an important source of income, nearly 85 tons of silk being produced every year. Cattle-breeding is largely pursued, not only by the nomads but also by the settled population, and in 1881 it was estimated that Syr-Daria had 212,000 camels, 396,000 horses, 294,000 horned cattle, and 3,200,000 sheep. Fishing is pursued to some extent on the lower Syr. Timber and firewood are exceedingly dear; timber is floated down from the mountains, but in small quantities; trees raised in gardens, dung, and some coal (the last in very limited quantity) are used for fuel.

The population of the province amounted to 1,109,500 in 1881, of whom 146,300 lived in towns, 326,600 were settled, and 621,600 were nomadic. It is comparatively dense in certain parts, reaching 15 to 31 inhabitants per square mile in Kurama and Khojend, and still more in the valley of the Tchirtchik. Its ethnographical composition is very mixed. The Russians barely number 8500, if the military be left out of account; they live principally in towns and about Kazalinsk. Kirghiz (709,400 with the Kara-Kirghiz) and Sarts (211,000) are the main elements of the population; 50,000 Tadjiks, 26,000 Uzbegs, 4500 Tatars, about 77,000 Kuramints (settled Kirghiz mixed with other elements), and a few Jews, Persians, and Hindus must be added. The chief occupations of the Sarts, Uzbegs, Tadjiks, and Kuramints are agriculture and

[1] Comp. J. Mushketoff's *Turkestan*, vol. i.

gardening, while the Kirghiz chiefly lead a nomadic pastoral life. Manufactures are represented by a few distilleries, but a great variety of petty industries are practised in the towns and villages. Trade is carried on very largely.

Syr-Daria is divided into eight districts, the chief towns of which, with their populations in 1881, were—TASHKEND (*q.v.*) (100,000), Aulie ata (4450), Jizak (8700), Kazalinsk (2950), Khojend (28,000), Perovsk (3400), Tchemkent (8050), and Tchinaz (300). Turkestan or Agret (6700) and Ura tube (11,000) also deserve mention. (P. A. K.)

SYRIA. Etymologically, "Syria" is merely an abbreviation of "Assyria," a name which covered the subject-lands of the Assyrian empire, the subject-peoples being also called "Syrians." Afterwards, in the Græco-Roman period, the shorter word came to be restricted to the territory west of the Euphrates,—the designation "Syrians," however, being given to the great mass of the Semitic populations dwelling between the Tigris and the Mediterranean, who are more accurately called Aramæans (Gen. x. 22; comp. SEMITIC LANGUAGES, vol. xxi. p. 645 *sq.*). The present article deals with Syria only in its geographical significance. For a map, see vol. xvi. pl. VIII.

Boundaries and extent. Syria is the designation of the country which extends for about 380 miles (between 36° 5′ and 31° N. lat.) along the eastern shore of the Mediterranean; its eastern limit properly speaking is formed by the middle portion of the course of the Euphrates, but in point of fact it insensibly merges into the steppe country which naturally belongs more or less to Arabia. It is only the oases lying nearest the western border of the steppe (*e.g.*, Aleppo, Palmyra) that can be reckoned as belonging to Syria.[1] From time immemorial the land between Egypt and the Euphrates has been the battlefield for the empires of western Asia on the one hand and those of Egypt and Africa on the other. It has also been the territory which the trading caravans of these empires have had to traverse; and by its position on the Mediterranean it has been the medium for transmitting the civilizing influences of the East to the West and again of the West to the East. Hence it is easy to understand how the peoples of Syria should only in exceptional cases have played an independent part either in politics or in art and science; none the less on that account is their place in history one of the highest interest and importance.

Orography. The surface configuration of the country is a uniform one; the mountains for the most part stretch from north to south in parallel ridges, connecting the Cilician Taurus with the Red Sea range. The continuity is broken for short intervals at one or two points. Immediately connected with the Cilician Taurus in the north, and forming part of it, is the Alma Dagh (ancient Amanus). At its highest it does not rise much above 6000 feet, but it has an abrupt descent towards the sea, and terminates at its southern extremity in a bold headland, the Rás el-Khanzír. Here the Orontes reaches the sea through a depression in the chain, and the same outlet forms an important pass into the interior of the country. Frequently in ancient times it was only the territory to the south of the lower Orontes valley that was reckoned as constituting Syria. Farther south is the isolated Jebel Akra', about 6000 feet high (the Mons Casius of the ancients), which was held sacred by the Phœnicians; still farther to the south are the low Ansarii Hills, which derive their name from the people inhabiting them. Beyond those the Nahr el-Kebír (Eleutherus) falls into the sea, and here north Syria may be held to terminate. To the south of this begins the Lebanon district (see LEBANON, vol. xiv. p. 393); an imaginary line drawn eastwards from a point a little to the south of Tyre will represent the southern boundary of what may be designated as middle Syria. Occasionally Syria is spoken of in a narrow sense, as distinguished from Palestine; but there is no scientific ground for such a practice, for the mountains of PALESTINE (*q.v.*), the southern third of Syria, can be described as a southward continuation of the mountain masses already referred to, and cis-Jordanic as well as trans-Jordanic Palestine is simply a portion of Syria. Indeed the district as far as Sinai can be spoken of as a fourth division of the same country. A glance at a geological map reveals this very clearly. Cretaceous limestone constitutes the bulk of the hills and plateaus of Syria, and extends towards Sinai, where the zone of primitive rocks is reached. In the south of Palestine, nummulitic limestone and Nubian sandstone make their appearance from Sinai and northern Arabia. In addition to these, alluvial soils are principally met with. In middle Syria especially, eastwards from the upper course of the Jordan, great basaltic masses occur; in the Hauran (comp. BASHAN, vol. iii. p. 410) there are basalt peaks nearly 6000 feet in height. The basalt mountains are often much broken up so as to be quite inaccessible (Harra), but the basalt when decomposed forms the best of arable soils. It is only in isolated cases that the igneous formation extends into western Syria. The tableland to the east of the principal mountain chains consists partly of good clay soil; the steppe (*bádiyet esh-sham*, also called *hamád*), which has an average elevation of about 1800 feet, extends towards the Euphrates with a gradual slope.

Rivers. The direction of the principal valleys is determined by that of the mountains. The chief river of Syria in the narrower sense is the Orontes (Arabic *El-'Así*), which rises in the Beká', the mountain valley between Libanus and Antilibanus, and follows a northerly course. At Antioch, where it is augmented by the stream which flows from the great lake of Ak Deniz, it turns westwards, falling into the sea near the ancient Seleucia. Not far from the source of the Orontes is that of the Lítání (formerly Líta), which runs southwards through the Beká', and afterwards westwards through a deep gorge of its own excavation, having its mouth a little to the north of Tyre; in its lower course it bears the name of El-Kásimíye. The principal river of south Syria is the JORDAN (*q.v.*). Like it, most of the other streams of Syria rising on the eastern side of the watershed terminate in inland lakes. Of these may be named the El-A'waj and the Barada (Pharpar and Abana) of Damascus, which lose themselves in the lakes and marshes to the east of the city. In like manner the river of Aleppo falls into the lake El Match. The 'Afrína (Ufrenus of the ancients) falls into the Ak Deniz lake, and so into the Orontes; the Sádjúr is a tributary of the Euphrates. Other lakes are the great salt lake to the south east of Aleppo and the remarkable lake near Homs, in the neighbourhood of which the ruins of the old Hittite city of Kadesh have recently been discovered. The coastal streams have been enumerated under LEBANON and PALESTINE (*q.v.*).

Vegetation. Two distinct floral regions meet in Syria (comp. LEBANON). That of the coast is Mediterranean, and is characterized by a number of evergreen shrubs, with small leathery leaves, and of quickly flowering spring plants. On the coast of Phœnicia (comp. vol. xviii. p. 801) and southwards towards Egypt more southern forms of the same vegetation occur, as, for example, *Ficus Sycomorus*, and especially date palms. This region is separated from the easterly one, that of the steppe flora, by the ridge of Lebanon and the mountains of Palestine. It is distinguished by the variety of its species, by the dry and thorny character of its shrubs, and by its marked poverty in trees. The Jordan valley has on account of its low level a sub tropical character. As regards cultivated species, Syria is the home of the olive tree, which, like the vine, is found in all parts; but the white mulberry for silk is limited to a small district. Syria is throughout far from unfertile; the district of the Hauran is one magnificent corn-field, while the orchard land about Damascus is renowned far and wide. In former times, however, cultivation was carried on with much greater zeal, and the arrangements for irrigation—a necessity everywhere, especially on the side bordering on the steppe—were much more considerable and more carefully seen to. The numerous ruins on the lands at

[1] In the cuneiform inscriptions Syria is called *Mát Hatti*, "the land of the Cheta," a designation transferred from the north Syrian people of that name (see below) to the region as a whole; *Mát Aharri*, the "hinder" or "western" land, denotes more properly the southern portion, but is also used for the whole. By the Arabs it is called *Esh Shám* (more properly *Esh Sha'm*), "the land on the left hand," as distinguished from *Yemen*, "the land on the right"; but the designation originally implied a wider region than the Syria defined above, including as it did a portion of Arabia.

present under cultivation and still more on those to the east of them indicate that the limits of agriculture were once more extensive and the population much denser than at present. During the Roman period frontier fortresses on the edge of the steppe served to check the rapacity and barbarizing influence of the Bedouin hordes.

limate. Syria presents great diversities of climate. The mountains, though sometimes not absolutely very high, arrest the west winds blowing from the Mediterranean, so that the atmospheric precipitation is much greater on the western than on the eastern slopes. Hence the springs on the eastern versant are fewer, and cultivation is therefore confined to isolated areas resembling oases. The rainfall drains off with great rapidity, the beds of the streams soon drying up again. Within historic times the climate, and with it the productivity of the country, cannot have greatly changed; at most the precipitation may have been greater, the area under wood having been more extensive. Except for Jerusalem, we have hardly any accurate meteorological observations; there the mean annual temperature is about 63° Fahr.; in Beyrout it is about 68°. The rainfall in Jerusalem is 36.22 inches, in Beyrout 21.66. The heat at Damascus and Aleppo is great, the cooling winds being kept off by the mountains. Frost and snow are occasionally experienced among the mountains and on the inland plateaus, but never along the coast. Even the steppe exhibits great contrasts of temperature; there the rainfall is slight and the air exceedingly exhilarating and healthy. The sky is continuously cloudless from the beginning of May till about the end of October; during the summer months the nights as a rule are dewy, except in the desert. Rain is brought by the west wind; the north-west wind, which blows often, moderates the heat. On the other hand, an ozoneless east wind (sirocco) is occasionally experienced—especially during the second half of May and before the beginning of the rainy season—which parches up everything and has a prejudicial influence on both animal and vegetable life. On the whole the climate of Syria—if the Jordan valley and the moister districts are excepted—is not unhealthy, though intermittent fevers are not uncommon in some places.

Ancient Syrians. Of the political relations of Syria in ancient times we know but little. Each town with its surrounding district seems to have constituted a small separate state, the conduct of affairs naturally devolved upon the noble families. At a very early period—as early probably as the 15th century B.C.—Syria became the meeting-place of Egyptian and Babylonian elements, resulting in a type of western Asiatic culture peculiar to itself, which through the commerce of the Phœnicians was carried to the western lands of the Mediterranean basin. Industry especially attained a high state of development; rich garments were embroidered and glass and the like were manufactured. The extant inventories of spoil carried off by the ancient conquerors include a variety of utensils and stuffs. The influence exercised at all times on Syrian art by the powerful neighbouring states is abundantly confirmed by all the recent finds. The Syrians were more original in what related to religion: every place, every tribe, had its "lord" (Ba'al) and its "lady" (Ba'alat), the latter is generally called 'Ashtar or 'Ashtaret. Besides the local Baal there were "the god of heaven" (El) and other deities; human sacrifices as a means of propitiating the divine wrath were not uncommon. But in the Syrian mythology foreign influences frequently betray themselves. Over against its want of originality must be set the fact, not merely that Syrian culture spread extensively towards the west, but that the Syrians (as is shown by recently discovered inscriptions) long before the Christian era exercised over the northern Arabs a perceptible influence, which afterwards, about the beginning of the 1st century, became much stronger through the kingdom of the Nabatæans. The art of writing was derived by the Arabs from the Syrians.

elations with ancient Egypt. Something about the ancient political and geographical relations of Syria can be gleaned from Egyptian sources, especially in connexion with the campaigns of Thothmes III. in western Asia. The Egyptians designated their Eastern neighbours collectively as 'Amu. Syria up to and beyond the Euphrates is called more precisely Ṣahi (or Zahi), and is regarded as consisting of the following parts:—(1) Rutenu, practically the same as Palestine (occasionally Palestine with Cœlesyria is called Upper Rutenu, as distinguished from Lower Rutenu extending to the Euphrates); (2) the land of the Cheta (sometimes reckoned as belonging to Rutenu), with Kadesh on the Orontes as its capital; (3) Naharina, the land on both sides of the Euphrates (extending, strictly speaking, beyond the Syrian limits); (4) Kaftu, the coast land of the Phœnicians (Fenehu), along with Cyprus. The Canaanites in general are called Charu. From these lands the Egyptian kings often derived rich booty, so that in those days Syria must have been civilized and prosperous. Moreover, we possess enumerations of towns in the geographical lists of the temple of Karnak and in a hieratic papyrus dating about 200 years after Thothmes III. Some of these names can be readily identified, such as Aleppo, Kadesh, Sidon, and the like, as well as many in Palestine. Those materials, however, do not enable us to form even a moderately clear conception of the condition of the country at that time. It is certain that most of the cities are of very great antiquity. It appears that the Cheta were very probably a non-Semitic people and that their power for a time extended far beyond the Syrian limits. Their inscriptions have not yet been deciphered with certainty. Within Syria their kingdom extended westwards from the middle course of the Euphrates to the neighbourhood of Hamath; their capital appears to have been Carchemish. The most prevalent opinion identifies Carchemish with Jerabís on the Euphrates, an identification which is favoured by the recent discovery of important "Hittite" monuments at the place. Before then the so-called "Hamath stones" were the most important inscriptions of the Cheta we possessed, but numerous others, as well as various other remains, are now at our command, and show that the influence of the powerful Cheta kingdom extended far into Asia Minor (compare HITTITES). The kingdom disappeared at an early date, but some of the minor Cheta states continued to subsist down to the 12th century B.C. Che[ta]

Next to the Cheta the Aramæans were the people who held the most important towns of Syria, gradually advancing until at last they occupied the whole country. Of the Aramæan stocks named in Gen. x. 23, xxii. 21 *sq.*, very little is known, but it is certain that Aramæans at an early period had their abode close on the northern border of Palestine (in Maachah). A great part was played in the history of Israel by the state of Aram Dammesek, *i.e.*, the territory of the ancient city of Damascus (see vol. vi. p. 790); it was brought into subjection for a short time under David. The main object of the century-long dispute between the two kingdoms was the possession of the land to the east of the Jordan (Hauran, and especially Gilead). Another Aramæan state often mentioned in the Bible is that of Aram Zobah. That Zobah was situated within Syria is certain, though how far to the west or north of Damascus is not known; in any case it was not far from Hamath. Hamath in the valley of the Orontes, at the mouth of the Beká' valley, was from an early period one of the most important places in Syria; according to the Bible, its original inhabitants were Canaanites. The district belonging to it, including amongst other places Riblah (of importance on account of its situation), was not very extensive. In 733 B.C. Tiglath Pileser II. compassed the overthrow of the kingdom of Damascus; he also took Arpád (Tell Arfád), an important place three hours to the north of Aleppo. Hamath was taken by Sargon in 720. Henceforward the petty states of Syria were at all times subject to one or other of the great world empires, even if in some cases a certain degree of independence was preserved. Ara[means]

The foundation of numerous Greek cities shortly after Alexander's time was of great importance for Syria. ANTIOCH (*q.v.*), founded about 300 B.C. by Seleucus, became the capital of the Syrian kingdom of the Seleucidæ. Among other influential Greek towns were Apamea on the Orontes and Laodicea. The Seleucidæ had severe struggles with the Ptolemies for the possession of the southern part of Syria (comp. ISRAEL, vol. xiii. p. 420). Gre[ek] peri[od]

After having been reckoned for a short time (from 83 to 69 B.C.) among the dominions of Tigranes, king of Armenia, the country was conquered for the Romans by Pompey (64-63 B.C.). It is impossible here to follow in detail the numerous changes in the distribution of the territory and the gradual disappearance of particular dynasties which maintained a footing for some time longer in Chalcis, Abila, Emesa, and Palestine; but it is of special interest to note that the kingdom of the Arab Nabatæans (comp. vol. xvii. p. 160) was able to subsist for a considerable period towards the north as far as Damascus. In the year 40 B.C. Syria had to endure a sudden but brief invasion by the Parthians. The country soon became one of the most important provinces of the Roman empire; its proconsulship was from the first regarded as the most desirable, and this eminence became still more marked afterwards. Antioch, adorned with many sumptuous buildings, as the chief town of the provinces of Asia, became in point of size the third city of the empire; its port was Seleucia, surnamed Pieria. The high degree of civilization then prevailing in the country is proved by its architectural remains dating from the early Christian centuries; the investigations of De Vogüé have shown that from the 1st to the 7th century there prevailed in north Syria and the Hauran a special style of architecture,—partly no doubt following Græco-Roman models, but also showing a great deal of originality in details. Un[der] Ro[mans]

The administrative divisions of Syria during the Roman period varied greatly at different times; subjoined is an enumeration of them as they existed at the beginning of the 5th century. (1) Syria Euphratensis, which had for its capital Hierapolis (Syr. *Mabóg*, Arab. *Mambidj*, Gr. Βαμβύκη). The kingdom of Commagene, beyond the limits of Syria, belonged to Syria Euphratensis; its capital was Samosata, at the point where the Euphrates leaves the mountains, and it had other important towns on that river, such as Europus (the modern Barbalissus). (2) Syria I., or Cœlesyria, having Antioch as its capital. The name Cœlesyria (ἡ κοίλη Συρία) originally, no doubt, was applied to the valley between Libanus and Antilibanus, but was afterwards extended Ro[man] div[isions]

to the district stretching eastwards from the latter range (3) Syria II, or Syria Salutaris, with Apamea (Arab *Famiya*, the modern Kal'at el Mudik) on the Orontes as capital (4) Phœnice Maritima, capital, Tyre (5) Phœnice ad Libanum, capital, Emesa (Hims) To this division Damascus and Palmyra belonged, occasionally they were reckoned to Cœlesyria, the middle strip of coast being designated Syrophœnicia (6, 7, 8) Palestina I, II, and III For these, which from the time of Vespasian had governors of their own, see vol xviii p 177 (9) Arabia (capital, Bostra), which embraced all the region from the Hauran to the Arnon, and skirted the Jordan valley, stretching southwards to Petra Through the kingdom of the Nabatæans Roman influence penetrated from Syria far into northern Arabia

Under Mohammedan rule. In 616 Syria was subjugated for a brief period by the Persian Chosroes II, from 622 till 628 it was again Byzantine, 636 and the immediately following years saw its conquest by the Mohammedans (see MOHAMMEDANISM, vol xviii p 562) Mo'awiya, the first Ommayad caliph, chose Damascus for his residence, but in 750 the capital of the empire was removed by the 'Abbásids to Baghdád Under the early caliphs the Arabs divided Syria into the following military districts (*gonds*) (1) Filistin (Palestine), consisting of Judæa, Samaria, and a portion of the territory east of Jordan, its capital was Ramleh, Jerusalem ranking next (2) Urdun (Jordan), of which the capital was Tabariye (Tiberias), roughly speaking, it consisted of the rest of Palestine as far as Tyre (3) Damascus, a district which included Baalbec, Tripoli, and Beyrout, and also the Hauran (4) Hims, including Hamath (5) Kinnasrín, corresponding to northern Syria, the capital at first was Kinnasrín to the south of Haleb (Aleppo), by which it was afterwards superseded (6) The sixth district was the military frontier (*'awásim*) bordering upon the Byzantine dominions in Asia Minor The struggles of the Mohammedan dynasties for the possession of Syria cannot be gone into here, suffice it to say that throughout their course the country still enjoyed a considerable degree of prosperity

In the crusading period the kingdom of Jerusalem, whose rulers were never able to establish a foothold to the east of the Jordan, extended northwards to Beyrout, next it was the countship of Tripoli on the coast, and beyond that in north Syria was the principality of Antioch Syria suffered severely from the Mongol invasions (1260), and it never recovered its former prosperity

Turkish supremacy. In 1516 the Ottomans took it from the Egyptian Mamelukes Under the Turks its administrative divisions again varied at different times, out of the five pashalics of Aleppo, Tripoli, Damascus, Sidon (later 'Akka), and Jerusalem two vilayets were subsequently formed, having their capitals at Aleppo and Damascus Quite recently south Palestine has been made a separate vilayet from that of Damascus

Languages. Rude stone monuments (circles and dolmens) and other prehistoric remains show that Syria must have been inhabited from a very early period. Within historic times a great number of different nationalities have fought and settled within its borders, the majority belonging to the Semitic stock This last circumstance has rendered possible a considerable degree of fidelity in the tradition of the oldest local names After the Aramæans had absorbed what remained of the earlier population, they themselves were very powerfully influenced by Græco-Roman civilization, but as a people they still retained their Aramæan speech At present an Aramaic dialect largely mixed with Arabic is spoken in three villages on the eastern slope of Antilibanus (in Ma'lúla, Bakh'a, and Jub'adín), but this small survival is on the point of disappearing Throughout the whole country elsewhere the language spoken is Arabic, but with Aramaic elements, especially in the language of the peasants Ethnographically the Aramaic element of the population admits of being distinguished from the Arabic type, it is specially strong in the mountain districts The majority of the Christians dwelling in Syria may be regarded as representatives of the Aramæan race No traces of the earlier races, such as the Canaanites or Phœnicians, can any longer be distinguished, and every trace of the presence of Greeks, Romans, and Franks has completely disappeared

Arab elements of population. In the Arab immigration, two principal types are to be distinguished,—the pure Arab type of the nomad tribes (Bedouins) and the type of the sedentary town Arabs and peasants, which shows an intermixture of foreign and older elements The two confront each other in sharp contrasts Bedouin tribes are scattered throughout the whole country, despising agriculture and the settled life, they are found with their camels, sheep, and goats on the borders of the territories appropriated by the peasants Being more or less independent of the Government, especially in the district bordering on the steppe, they are able to exact black mail from their sedentary brethren Taxed thus on both hands, the life of the peasant is economically far from an easy one, hence it should be the duty of Government to restrain the influence of the nomads and to force them as far as possible to form fixed settlements In this respect the policy of the Turks during the 19th century to ensure the safety of the peasants and of travellers has been on the whole successful In the districts bordering on the coast there are no large nomadic tribes, and on the higher plateaus of the cultivated land the power of the Bedouins is much reduced, but south of Palestine and everywhere on the edge of the steppe they continue much as before The most powerful tribe of the Syrian desert is that of the 'Aneze, falling into numerous subdivisions, of which the Ruwala, Wuld 'Alí, Hesene, and Bischer may be mentioned The tribe, estimated to number 300,000 in all, extends far into Arabia and reaches the Euphrates The other Bedouin tribes of Syria have for the most part tolerably definite and circumscribed territories East of the Jordan the best known are the 'Adwán on the Balka and the Bani Sakhr in Moab The Bedouins to the south of the Dead Sea are called Ahl el Kibli ("the people of the south") in contradistinction to those of the north (Ahl esh Shemál) Finally, there occur sporadically in central and northern Syria nomadic Turkish tribes Gipsy hordes are also met with in considerable numbers

Religions. The religions as well as the ethnographical types are strongly divergent The bulk of the population are Mohammedan, the Bedouins have not much religion of any kind, but they profess Islam Besides orthodox Moslems there are also Shí'ite sects, such as that of the Metáwile (especially in northern Palestine), as well as a number of religious communities whose doctrine, combining philosophical and Christian with Mohammedan elements, is the outcome of the process of fermentation that characterized the first centuries of Islam To this last class belong the Ishmaelites, Nosairians, and especially the DRUSES (*q v*) In many cases it is obvious that the political antipathy of natives against the Arabs has found expression in the formation of such sects The Nosairians, for instance, and no doubt the Druses also, were originally survivals of the Syrian population The Jews are found exclusively in the larger centres of population, in every case they have immigrated back from Europe The Christians are an important element, constituting probably as much as a fifth of the whole population, the majority of them belong to the Orthodox Greek Church, which has two patriarchs in Syria, at Antioch and Jerusalem Catholics—United Greeks, United Syrians, and Maronites—are numerous The mission of the American Presbyterian Church, which has had its centre in Beyrout for the last sixty years, has done much for Syria, especially in the spread of popular education, numerous publications issue from its press, and its medical school has been extremely beneficial The Catholic mission has done very good work in what relates to schools, institutes, and the diffusion of literature The Christians constitute the educated portion of the Syrian people, but the spirit of rivalry is producing stimulative effects on the Mohammedans, who have greatly fallen away from that zeal for knowledge which characterized the earlier centuries of their faith

Area and population. Accurate statistics of any kind for Syria cannot be had, even the area of the land under cultivation is unknown The returns of population are, according to the Turkish official documents, only approximations The total population may safely be put at less than 2,000,000, an official estimate in 1872-73 gave 1,365,680, of whom 976,322 were Mohammedans Probably, however, this was an under-estimate Reclus (*Nouv Géogr Univ*, Paris, 1884) gives the area of Syria as 183,000 square kilomètres (70,638 square miles) and the population as 1,150,000

Commerce and industry. From the Egyptian and Assyrio Babylonian monuments we learn that in ancient times one of the principal exports of Syria was timber, this has now entirely ceased But it continues to export wheat, and with good roads the amount could be very largely increased Other articles of export are silk cocoons, wool, hides, sponges, and fruits (almonds, raisins, and the like), the amounts of cotton, tobacco, and wine sent out of the country are small The only good harbours are those of Beyrout and Alexandretta (Scanderoon) The caravan trade with the East has almost entirely ceased, and the great trade routes from Damascus northwards to Aleppo and eastwards through the wilderness are quite abandoned The traffic with Arabia has ceased to be important, being limited to the time of the going and returning of the great pilgrim caravan to Mecca, which continues to have its mustering place at Damascus The native industries in silk, cotton, and wool have been almost entirely destroyed by the import trade from Europe The land is poor in minerals, including coal, water power also is deficient, so that the introduction of European industries is attended with difficulties even apart from the insecurity of affairs, which forbids such experiments as the improvement of agriculture by means of European capital As regards the cultivation of the soil Syria remains stable, but the soil is becoming relatively poorer, the value of the imports constantly gaining upon that of the exports

Literature—Ritter, *Erdkunde von Asien*, vol xvii, parts 1 and 2, Berlin, 1854-55, Burckhardt, *Travels in Syria and the Holy Land*, London, 1822, Lortet, *La Syrie d'aujourd'hui*, Paris, 1884, Baedeker, *Palestine and Syria*, Murray's *Syria and Palestine*, Porter, *Five Years in Damascus*, 2 vols, London, 1855, Burton and Drake, *Unexplored Syria*, 2 vols, London, 1872, A v Kremer, *Mittelsyrien u Damascus*, Vienna, 1853 For the art history of Syria De Vogüé's *Syrie Centrale architecture civile et religieuse du 1er au 7me siècle* (Paris, 1865-77) may be consulted, and on its trade Zwiedineck v Sudenhorst, *Syrien u seine Bedeutung fur den Welthandel*, Vienna, 1873 (A SO)

SYRIAC LITERATURE

THE literature of Syria, as known to us at the present day, is, with the exception of translations from the Greek and some other languages, a Christian literature. The writings of the Syrian heathens, such as the so-called Sābians (see SABIANS) of Harrān, which were extant, at least in part, even in the 13th century,[1] seem to have now wholly disappeared. The beginnings of this literature are lost in the darkness of the earliest ages of Christianity. It was at its best from the 4th to the 8th century, and then gradually died away, though it kept up a flickering existence till the 14th century or even later. We must own—and it is well to make the confession at the outset—that the literature of Syria is, on the whole, not an attractive one. As Renan said long ago,[2] the characteristic of the Syrians is a certain mediocrity. They shone neither in war, nor in the arts, nor in science. They altogether lacked the poetic fire of the older—we purposely emphasize the word—the older Hebrews and of the Arabs. But they were apt enough as pupils of the Greeks; they assimilated and reproduced, adding little or nothing of their own. There was no Al-Fārābī, no Ibn Sīnā, no Ibn Rushd, in the cloisters of Edessa, Ken-neshrē, or Nisibis. Yet to the Syrians belongs the merit of having passed on the lore of ancient Greece to the Arabs, and therefore, as a matter of history, their literature must always possess a certain amount of interest in the eyes of the modern student. The Syrian Church never produced men who rose to the level of a Eusebius, a Gregory Nazianzen, a Basil, and a Chrysostom; but we may still be thankful to the plodding diligence which has preserved for us in fairly good translations many valuable works of Greek fathers which would otherwise have been lost. And even Syria's humble chroniclers, such as John of Ephesus, Dionysius of Tell-Mahrē, and Bar-Hebræus, deserve their meed of praise, seeing that, without their guidance, we should have known far less than we now know about the history of two important branches of the Eastern Church, besides losing much interesting information as to the political events of the periods with which their annals are occupied.

As Syriac literature commences with the Bible, we first briefly enumerate the different versions of Holy Scripture.

Pĕshīttā.

The most important of these is the so called Pĕshīttā (*mappaktā pĕshīttā*), "the simple" or "plain version," the Syriac vulgate. This name is in use as early as the 9th or 10th century.[3] As to the Old Testament, neither the exact time nor place of its translation is known; indeed, from certain differences of style and manner in its several parts, we may rather suppose it to be the work of different hands, extending over a considerable period of time. It would seem, however, as a whole, to have been a product of the 2d century, and not improbably a monument of the learning and zeal of the Christians of Edessa. Possibly Jewish converts, or even Jews, took a part in it, for some books (such as the Pentateuch and Job) are very literally rendered, whereas the coincidences with the LXX (which are particularly numerous in the prophetical books) show the hand of Christian translators or revisers. That Jews should have had at any rate a consultative share in this work need not surprise us, when we remember that Syrian fathers, such as Aphraates, in the middle of the 4th century, and Jacob of Edessa, in the latter half of the 7th, had frequent recourse, like Jerome, to the scholars of the synagogue. To what extent subsequent revision may have been carried it is not easy to say, but it seems tolerably certain that alterations were made from time to time with a view to harmonizing the Syriac text with that of the LXX. Such an opportunity may, for instance, have been afforded on a considerable scale by the adoption of Lucian's text of the LXX at Antioch in the beginning of the 4th century (see SEPTUAGINT, vol. xxi. p. 669). On all these points, however, we know nothing for certain, and may well repeat the words of Theodore of Mopsuestia in his commentary on Zephaniah i. 6:[4] ἡρμήνευται δὲ ταῦτα εἰς μὲν τὴν Σύρων παρ' ὅτου δή ποτε· οὐδὲ γὰρ ἔγνωσται μέχρι τῆς τήμερον ὅστις ποτὲ οὗτος ἐστίν.

Canonical books of Old Testament.

The canonical books of the Old Testament according to the Pĕshīttā are substantially those of the Hebrew Bible. In the Massoretic MSS. (see below), whether Nestorian or Jacobite, the books of Chronicles, Ezra, and Nehemiah are passed over, and in the Nestorian the book of Esther also. But, on the other hand, it must be noticed that all these books are cited by Aphraates, and that they all appear in the *Codex Ambrosianus*. Of the Chronicles there is a MS. of the 6th century in the British Museum, Add. 17104. Esther appears in a volume of equal age (Add. 14652) as one of the constituent parts of the "Book of Women," the others being Ruth, Susanna, Judith, and the history of Thecla, the disciple of St Paul, which last is excluded from Biblical MSS. The oldest dated MS. of any portion of the Old Testament at present known to us is Add. 14425 in the British Museum (Gen., Exod., Num., Deut.), transcribed at Āmid by a deacon named John in 464.

Apocrypha.

The deutero-canonical books or apocrypha, translated by different hands from the Greek,[5] are nearly the same as in the LXX.[6] The *Codex Ambrosianus*,[7] for example, contains Wisdom, the Epistle of Jeremiah, and two Epistles of Baruch; the Song of the Three Children, Bel and the Dragon, and Susanna; Judith, Siracides or Ecclesiasticus; the Apocalypse of Baruch; the fourth book of Esdras; and five books of the Maccabees, the fourth being the history of Simona and her sons, and the fifth *Josephi de Bello Judaico lib. vi.*[8] To these must be added from other MSS. the first or third book of Esdras, the book of Tobit, and the prayer of Manasses. Of the first book of the Maccabees two recensions are extant, as far as chap. xiv. 24. The book of Tobit presents the text of the LXX as far as chap. vii. 11.[9]

Canonical books of New Testament.

The canonical books of the New Testament are the four Gospels, the Acts of the Apostles (to which are annexed the three catholic epistles, viz., James, 1 Peter, and 1 John), and the fourteen epistles of St Paul. The shorter apostolic epistles, viz., 2 and 3 John, 2 Peter, and Jude, and the Apocalypse of St John, were rejected by the early Syrian Church.[10]

Tatian's Diatessarōn and the Curetonian.

As to the Pĕshīttā version of the Gospels (P), a variety of critical questions arise when we consider it in connexion with two other works, the *Dia-tessarōn* of Tatian (T) and the *Curetonian Gospels* (Sc).[11] Tatian, the friend of Justin Martyr, afterwards counted a heretic, composed out of the four Gospels a work which received the title of Τὸ διὰ τεσσάρων εὐαγγέλιον, in Syriac more briefly *Dia-tessarōn*, or *Evangelion da-Mĕhallĕtē*, "the Gospel of the Mixed." It is a subject of controversy whether Tatian wrote this work in Greek or in Syriac, and whether he compiled it from the Greek Gospels or from a previous Syriac version. According to Zahn[12] and Baethgen,[13] the author's language was Syriac, his sources Greek. They hold that this was the only Gospel in use in the Syrian Church for nearly a century, but that about the year 250, under the influence of Western MSS. of the Greek

[8] See *Das 6te Buch d. Bellum Judaicum übersetzt u. kritisch bearbeitet*, by Dr H. Kottek, Berlin, 1886; only capp. 1 and 2.

[9] See the Syriac note on p. xii. of De Lagarde's edition.

[10] The principal editions of the Peshīttā are contained in the Paris polyglott of Le Jay and the London polyglott of Walton, to which latter is attached the immortal *Lexicon Heptaglotton* of Edmund Castell. The Old Testament (without the apocrypha) was edited by S. Lee in 1823 for the Bible Society, and is frequently bound up with the New Testament of 1826. The first edition of the New Testament was that of J. A. Widmanstad, with the help of Moses of Mārdīn (Vienna, 1555). Those of Tremellius (1569), Trost (1621), Gutbir (1664), and Leusden and Schaaf (1708, 1717) are well known. To the last named belongs Schaaf's admirable *Lexicon Syriacum Concordantiale*. The American missionaries at Urūmiyah have published both the Old and New Testaments in ancient and modern Syriac, the former in 1852, the latter in 1846.

text (see Westcott and Hort, *The New Testament in the Original Greek*, Introd, §§ 118, 214), a version of "the Separate Gospels," *Evangelion da-Mĕpharrĕshē*, was introduced [1] The translator, according to Baethgen,[2] made use of T as far as he could, and of this text Sc is, in the opinion of these scholars, the solitary survival in our days The evidence for this view does not, however, appear to be conclusive It seems that a Syriac version of the four Gospels, as well as of the other parts of the New Testament, must have existed in the 2d century, perhaps even before the version of the Old Testament From this Tatian may have compiled his *Dia tessarōn*, or he may have written that work in Greek and others may have done it into Syriac Be that as it may, T certainly gained great popularity in the early Syrian Church, and almost superseded the Separate Gospels Aphraates quoted it[3], Ephraim wrote a commentary upon it[4], the *Doctrine of Addai* or Addæus (in its present shape a work of the latter half of the 4th century) transfers it to the apostolic times[5], Rabbūlā, bishop of Edessa (411-435), promulgated an order that "the priests and deacons should take care that in every church there should be a copy of the Separate Gospels (*Evangelion da-Mĕpharrĕshē*), and that it should be read"[6], and Theodoret, bishop of Cyrrhus (423-457), swept up more than two hundred copies of it in the churches of his diocese, and introduced the four Gospels in their place τὰ τῶν τεττάρων εὐαγγελιστῶν ἀντεισήγαγον εὐαγγέλια[7] The result of these and similar well meant efforts is that not a single copy of T has come down to our times [8] Both Aphraates and Ephraim, however, made use of the Separate Gospels The former seems to have employed a text which Baethgen calls a slightly revised form of Sc (*op cit*, p 95), we would rather speak of it as a revised form of the old Syriac Gospels of the 2d century The latter made use of a more thorough Edessene revision, closely approaching in form to, if not identical with, P (Baethgen, p 95, Zahn, p 63) Our oldest MSS of P are, however, more than a hundred years later than Ephraim's time We cannot, therefore, expect very important textual results from the collation of even such MSS as Add 14470, 14453, 14459, ff 1-66, and 17117, in the British Museum, all of which may be safely ascribed to the latter part of the 5th or the beginning of the 6th century Early in the 5th century Rabbūlā, bishop of Edessa, the friend and correspondent of Cyril of Alexandria, occupied himself with "translating the New Testament out of the Greek into the Syriac, because of its variations, exactly as it was" [9] This probably means, as has been suggested by Nestle, that Rabbūlā undertook a revision of the Syriac text according to a Greek MS or MSS in his possession, that is to say, still further assimilated P of that day to a Greek (possibly, from his connexion with Cyril, Alexandrian) text We do not as yet know, however, whether this revision was merely a private effort, or what influence, if any, it exercised on the history of P, more likely it was a first step in the direction of the Philoxenian version (see below) The result of these successive revisions as regards Sc has been that it survives in but one mutilated codex, and that written at comparatively so late a date as 450 470,[10]—a phenomenon which has its parallel in the case of the Itala codex *c* of the Gospels, copied in the 11th century The greater part of this volume is in the British Museum (Add 14451)[11], but there are three leaves of it in the royal library at Berlin, forming the fly-leaves of the MS marked Orient Quart 528 [12] Crowfoot's attempt to retranslate Sc into Greek is a failure (*Fragmenta Evangelica*, 1870 72), Baethgen's work (*Evangelienfragmente*, &c) will perhaps be found more satisfactory

The scholars of the Monophysite branch of the Syrian Church were, however, by no means satisfied even with the revised text of P, and demanded a yet more accurate reproduction of the Greek text in use among them Accordingly Aksĕnāyā or Philoxenus, bishop of Mabbōgh (485 519), undertook to satisfy this want, and with the assistance of his chorepiscopus, Polycarp, produced a literal translation of the whole Bible in the year 508 [13] This seems at first to have met with considerable approval, Moses of Aggēl, for example, who flourished from 550 to 570,[14] refers to the version of the New Testament and of the Psalms evidently as the standard work of the day [15] But it was in its turn superseded by two later revisions, and MSS of it are now very rare Portions of Isaiah survive in the British Museum, Add 17106, ff 74 87,[16] and the text of the Gospels in the codex A 2, 18 of the Biblioteca Angelica at Rome, of the 11th or 12th century,[17] and perhaps also in the Beirūt (Beyrout) MS described by the Rev Isaac H Hall [18] At the beginning of the 7th century the work of retranslation and revision was again taken in hand by the Monophysites, the scene of their labours being the different convents in the neighbourhood of Alexandria There, in the years 616 617,[19] Paul, bishop of Tellā dhĕ Mauzĕlath or Constantina, undertook a version of the hexaplar text of the LXX at the request of the patriarch Athanasius I [20] Of parts of this many MSS are extant in the British Museum and the Bibliothèque Nationale at Paris, and the Biblioteca Ambrosiana at Milan possesses the second volume of a codex of the entire work, which has been reproduced by photo-lithography under the direction of Ceriani [21] This version not only exhibits the asterisks and obeli of Origen's text of the LXX, but the marginal notes contain many readings of the other Greek translators, which have been largely utilized by Field in his noble work *Origenis Hexaplorum quæ supersunt* (2 vols, Oxford, 1875) At the same time and place the New Testament of Philoxenus was thoroughly revised by Thomas of Harkel or Heraclea,[22] bishop of Mabbōgh,[23] who, being driven from his diocese, betook himself to Alexandria and worked there in the convent of St Antony at the Enaton (or Nine mile village) [24] This version comprises not only all the books contained in the Pĕshīttā but also the four shorter epistles [25] The lapse of another century brings us to the last attempt at a revision of the Old Testament in the Monophysite Church Jacob, bishop of Edessa, undertook, when living in retirement in the convent of Tell 'Addā or Teleda,[26] in 704 705, to revise the text of the Pĕshīttā with the help of the Greek versions at his disposal,[27] thus producing a curious eclectic or patchwork text Of this work there are but five volumes extant in Europe, four of which came from the Nitrian Desert and form parts of a set which was written in the years 719-720 It would seem, therefore, never to have attained popularity [28]

Monophysite versions

Philoxenus

Paul of Tellā

Thomas of Harkel

Jacob of Edessa

One other version remains to be noticed, namely, that used by

[1] Zahn, *op cit*, pp 104 106

[2] *Op cit*, pp 59, 60, 72 *sq*

[3] Wright's edition, p [illegible], l 10, "as it is written at the head of the Gospel of our Lifegiver, In the beginning was the Word"

[4] Now extant only in the old Armenian version, translated by the Mechitarist Aucher, and revised by G Mösinger under the title of *Evangelii Concordantis Expositio facta a S Ephraemo*, Venice, 1876

Malkite version. the Christian population of the Malkite (Greek) Church in Palestine, written in an Aramaic dialect more akin to the language of the Jewish Targūms than to that of the Pĕshīttā.[1] A lectionary containing large portions of the Gospels in this dialect was described by Assemani in the catalogue of the Vatican library,[2] studied by Adler,[3] and edited by Count Fr. Miniscalchi Erizzo under the title of *Evangeliarium Hierosolymitanum* (2 vols., Verona, 1861-64). It was written in a convent at a place called Ābūd,[4] not very far from Jerusalem, in the year 1030, and the scribe claims to have copied sundry other service books for the use of his church (see Assemani, *op. cit.*, p. 102). Fragments of other evangeliaria have been published by Land, from MSS. at London and St Petersburg, in his *Anecd. Syr.*, iv. pp. 114-162, 213-222, of the Acts of the Apostles, p. 168, and of the Old Testament (translated from the Greek), pp. 103-110, 165-167, 222-223. According to the same authority (p. 231), the calendar in the Vatican MS. must have been drawn up about the middle of the 9th century. Few, if any, of the extant fragments appear to be of older date. Nöldeke places the origin of the version in the 4th or 5th century, certainly not later than 600 (*loc. cit.*, p. 525).[5]

All the above revisions of the text of the Syriac Bible according to the Greek are, as we have seen, the work of Monophysites, with the single exception of the last, which proceeded from the Malkites. The Nestorian community obstinately adhered to the old Pĕshīttā, and the solitary attempt made to introduce a revised text among

Mār-abhā I. them seems to have been an utter failure. Mār-abhā I.,[6] a convert from Zoroastrianism, who was catholicus from 536 to 552, went to Edessa, studied Greek there under a teacher named Thomas,[7] and with his help translated the whole of the Old Testament into Syriac, and perhaps also the New. This statement rests on the authority of the author of the *Kitāb al Majdal* (Mārī ibn Sulaimān,[8] about the middle of the 12th century, supplemented and abridged by 'Amr ibn Mattā of Tīrhān, who lived towards the middle of the 14th century),[9] of 'Abhd-ishō, bishop of Nisībis (died 1318), and of Bar Hebræus (died 1286), and there appears to be no reason to doubt their word.[10]

Massoretic MSS. Before quitting the subject of the versions of Holy Scripture we must devote a few words to the Massoretic MSS. of the Nestorians and Jacobites.[11] In the year 1721 Assemani made mention in the *Bibliotheca Orientalis* (ii. 283), on the authority of Bar Hebræus in the *Ausar Rāzē*, of a "versio *Karkaphensis*, hoc est *Montana*, qua videlicet incolæ montium utuntur."[12] About the meaning of these words scholars disputed, and some searched for MSS. of the alleged version, but in vain. At last, N. Wiseman (afterwards cardinal), guided by the light of another passage in the *Bibliotheca Orientalis* (ii. 499, 500, No. xxii.), recognized in Cod. Vat. clui. a copy of what he believed to be the Karkaphensian version.[13] Later researches, more especially those of the Abbé Martin, have corrected these errors. The MSS. of the Karkaphensian tradition, of which there are ten in our European libraries, are now known to contain a philological and grammatical tradition of the pronunciation and punctuation of Holy Writ and sometimes of other writings.[14] Syria was rich in schools and colleges; most of its towns possessed institutions where instruction was given, more especially to students of theology, in the reading and exposition of the Greek and Syriac Scriptures and their commentators. Such were the great "Persian school" of Edessa, which was destroyed, on account of its Nestorian tendencies, in 489, the school of Nisībis, of Māhōzē near Seleucia, of the monastery of Dōr Kōnī or Dair-Kunnā, of the monastery of Ken-neshrē or the Eagles' Nest, on the left bank of the Euphrates, opposite Jerābis, of the Dairā 'Ellāītā, or monastery of St Gabriel and St Abraham, at Mosul, and many others.[15] Every such school or college had its teachers of reading and elocution, *mahgĕyānē* and *makrĕyānē* (or *makeryānē*), who taught their pupils to pronounce, add the vowel-points, and interpunctuate correctly,[16] before they were passed on to the higher classes of the *eskōlāyē bādhōkē* or *mall'phānē*, that is, the professors of exegesis and doctors of theology.[17] The more difficult words and phrases of Scripture were gradually collected and written down so as to form "collectanea," *lukkātē dha shĕmāhē*, or "fasciculi," *kurrāsē dha shĕmāhē*, and the union of these composed a *kĕthābhā dhak'rāyāthā*, or "book of readings," in which it was shown by means of vowel points and other signs how each word was to be pronounced and accentuated.[18] One such volume in the British Museum (Add. 12138, dated 899) represents the work of a Nestorian student in the convent of Mār Gabriel at Harrān;[19] but the other MSS. extant in the different libraries of Europe[20] are of Jacobite origin and have a common source, the scholastic tradition of the convent of Karkaphĕthā, or "the Skull," at the village of Maghdal or Mijdal near Rēsh-'amā or Rās 'ain.[21] Such are, for example, Cod. Vat. No. clii., now cliii., described by Assemani (*Catal.*, iii. 287) and Wiseman (*Horæ Syr.*, p. 151), Cod. Paris, Ancien fonds 142, described by Zotenberg (*Catal.*, p. 30, No. 64) and Martin (*Tradition Karkaphienne*, p. 36), Cod. Brit. Mus. Add. 7183, described by Rosen (*Catal.*, p. 64, No. xlii.), and 12178, described by Wright (*Catal.*, p. 108). From these and similar MSS., as well as from the words of Bar-Hebræus,[22] it appears that the Karkĕphāyē were the monks of the convent of Karkaphĕthā, that they were Westerns or Occidentals, therefore Jacobites, and that one of their chief authorities, if not the actual originator of the compilation, was Jacob bishop of Edessa. Accordingly, the marginal notes indicate various readings from Syriac MSS., from the LXX., and from the Harklensian version, as well as from different fathers and teachers.[23] To the collection of words and phrases from the Pĕshīttā version is added in several of these MSS. a similar, though shorter, collection from the Harklensian version and from the principal works of the Greek fathers which were read in translations in the schools,[24] followed by tracts on different points of orthography, grammar and punctuation.[25]

We have spoken above (p. 824) of the deutero-canonical books of the Old Testament. Other apocrypha may now be noticed more briefly, *e.g.*, Ps. cli. (in the hexaplar version of Paul of Tellā), the works *Parva Genesis*, or *Liber Jubilæorum*, a fragment of which has been edited by Ceriani (*Monumenta*, vol. ii. fasc. 1, p. ix.), the Testament of Adam,[26] the History of Joseph and Āsyath (Asenath), translated by Moses of Aggēl,[27] the History of Sanhērīb, his Vizir Aḥīkār or Ḥīkār, and his Disciple Nādhān.[28] Many similar books exist in Arabic, some of them probably translated from lost Syriac originals. The names of Daniel and Ezra "the scribe" are prefixed to late apocalyptic works,[29] and even to almanacs containing prognostications of the weather, &c.[30] The list of apocrypha of the New Testament is also tolerably extensive. We may mention the *Protevangelium Jacobi*, the Gospel of Thomas the Israelite, or of the Infancy of our Lord, the Letters of Abgar and our Lord, the Letters of Herod and Pilate, prayers ascribed to St John the Baptist, the *Transitus*, *Assumptio*, or Κοίμησις *Beatæ Virginis*, extant in four or five redactions,[31] Acts of the Apostles, such as St John, St Philip, St Matthew and St Andrew, St Paul and Thecla, and St Thomas,[32] the Doctrine of St Peter,[33] and the Apocalypse of St Paul.[34] Others

of these apocrypha are extant in Arabic, but the Syriac originals have not yet been recovered. To these may be added such works as the *Didascalia Apostolorum*, edited (anonymously) by P. de Lagarde in 1854; extracts from the *Constitutiones Apostolorum*, ascribed to Clement, in the same editor's *Reliquiæ Juris Eccles. Antiq.*, pp. 2-32, 44-60; and the *Doctrina Apostolorum*, in Cureton's *Ancient Syriac Documents*, pp. 24-35, and in *Reliquiæ Juris Eccles. Antiq.* (under the title of *Doctrina Addæi*), pp. 32-44.

Service books. Into a description of the service-books of the Syrian Church in its different sects—Nestorians, Jacobites, Maronites, and Malkites—we cannot here enter.[1] The bare enumeration of the various psalters, lectionaries, missals, &c., would far exceed our present limits. The oldest Syriac psalter in our European collections is not earlier than 600 (Brit. Mus. Add. 17110), and the series of lectionaries commences with the 9th century. Of anaphoræ or liturgies it would be easy to specify some sixty.[2] The oldest of all is a fragment of the anaphora of Diodorus of Tarsus (in the British Museum, Add. 14699, ff. 20, 21), of the 6th century, which has been edited and translated by Bickell.[3]

Besides the versions of Holy Writ and other works enumerated above, the literature of Syria comprises a vast amount of matter, interesting not merely to the Orientalist but also to the classical scholar, the theologian, and the historian. Some portions of this literature we must now endeavour to pass under review.

Bardesānes. The long series of Syrian writers is headed by the name of Bar Daisān or Bardesānes, "the last of the Gnostics."[4] He was born at Edessa on 11th July 154,[5] and seems to have been the son of heathen parents of rank. Of the manner of his conversion to Christianity, and how he came to deviate from orthodoxy, we are uninformed. Part of his life he spent at the court of Edessa; then he betook himself as a missionary to the rude mountaineers of Armenia, and finally settled down in the fortress of Anium, where he probably remained till his death in 222.[6] He wrote, we are told, a *History of Armenia*, which Moses of Chorene used in a Greek translation; *Hypomnemata Indica*, compiled from the oral information which he obtained from an Indian embassy passing through Edessa on its way to the Roman court; and polemical treatises against the polytheism of the heathens and the dualism of Marcion. He and his son Harmonius were poets, and their hymns were greatly admired and imitated. Even Ephraim could not help admitting their merits, whilst he reviled them.[7] Of these works, however, only a few fragments have been preserved by later writers.[8] The famous dialogue Περὶ εἱμαρμένης or *De Fato*, which the voice of antiquity has unanimously ascribed to Bardesānes, was in reality composed by his disciple Philip, and doubtless presents us with an accurate account of his master's teaching. The Syriac title is *Kĕthābhā dhĕ Nāmōsē dh'Athrawāthā* (The Book of the Laws of the Countries).[9]

Simeon bar Sabbā'ē and Millēs. Of Simeon bar Sabbā'ē ("the Dyers' Son"), bishop of Seleucia and Ctesiphon, and Millēs, bishop of Susa, we know little beyond the fact of their martyrdom in the great persecution of the Christians by Shābhōr or Sapor II., which began in 339-340.[10] Simeon is said by 'Abhd-īshō'[11] to have written "epistles,"[12] which seem to be no longer extant. To him are also ascribed sundry hymns,[13] and a work entitled *Kĕthābhā dh'Abhāhāthā* (The Book of the Fathers), which, according to Sachau, treats of the heavenly and earthly hierarchy.[14] The writings of Millēs are stated by 'Abhd-īshō' (*loc. cit.*) to have been "epistles and discourses (*mēmrē*) on various subjects", but of these time has also robbed us.

Jacob of Nisibis. The name of Jacob (or St James) of Nisibis[15] is far more widely known. As bishop of that city he was present at the council of Nicæa. He lived to witness the outbreak of war between the Romans and the Persians, and is said to have delivered the city by his prayers from the latter power. He died in the same year (338).[16] To him has been ascribed, on the authority of Gennadius of Marseilles[17] and of the ancient Armenian version,[18] a collection of homilies, the Syriac text of which has only been recovered and published within the last few years. George, bishop of the Arab tribes, writing to a friend in the year 714, is aware that the author was a certain "Persian sage," *hakkīmā Phārsāyā*, and discusses his date and position in the church,[19] but does not think of identifying him with Jacob of Nisibis. Later writers are better informed.

Aphraates. Bar-Hebræus knows the name of Pharhādh as the author;[20] 'Abhd-īshō' gives the older form of Aphrahat or 'Αφραάτης;[21] and he is also cited by name by Elias of Nisibis (11th century) in his *Chronicle*.[22] The real author of the twenty-two alphabetical *Homilies* and the separate homily "On the Cluster" is now, therefore, known to have been Aphraates, a Persian Christian, who took the name of Jacob, and was subsequently famous as "the Persian sage." He was probably bishop of the convent of Mār Matthew near Mosul, and composed his works, as he himself tells us, in the years 337, 344, and 345, during the great persecution under Sapor II.[23]

Ephraim Syrus. A junior contemporary of Aphraates was Ephraim,[24] commonly called Ephraem Syrus, "the prophet of the Syrians," the most celebrated father of the Syrian Church and certainly one of its most voluminous and widely read writers. He was born of heathen parents at Nisibis, but became the pupil of the bishop Jacob, and finished his education at Edessa. The incidents of his career are too well known to need recapitulation here.[25] His death took place in June 373.[26] His works have been largely translated into Greek,[27] Armenian, Coptic, Arabic, and Ethiopic.[28] They consist of commentaries on the Scriptures, expository sermons, and a vast mass of metrical homilies and hymns on every variety of theological subject.[29] Many of these last are composed in his favourite seven-syllable metre, in stanzas of different length; but he frequently used other metres and mixed strophic arrangements.[30] Of Ephraim's commentaries on the Old Testament but little has reached us in the original Syriac.[31] Most of what has been published in *Ephraemi Opera Syr.*, vols. i. and ii., is derived from a large *Catena Patrum*, compiled by one Severus, a monk of Edessa, in 861.[32] Of his commentary on the *Diatessarōn*, preserved only in an early Armenian translation, we have spoken above (p. 825). In the same language there is extant a translation of his commentary on the Pauline epistles.[33] Vol. ii. of the Roman edition contains some exegetical discourses (pp. 316-395), the number of which has been largely increased by Overbeck (*S. Ephraemi Syri*, &c., *Opera Selecta*, pp. 74-104). In the same work will be found two of the discourses against early heresies addressed to Hypatius and Domnus (pp. 21-73; comp. Wright, *Catal.*, p. 766, col. 2), two tracts on the love of the Most High (pp. 103-112), and the epistle to the

and by Perkins, *Journal of the American Oriental Society*, viii. p. 182 *sq.*; reprinted in the *Journal of Sacred Literature*, January 1865, p. 372 *sq.*

27 Even Photius speaks with respect of the rhetorical talent of Ephraim, so far as he could judge of it from these imperfect translations (ed. Bekker, p. 160).

28 See *B. O.*, i. 149 *sq.*

29 *Ibid.*, i. 63-149; iii. 1, 61.

30 Compare, for instance, Bickell, *Carm. Nisib.*, Introd., p. 31. The Syrian line consists of a certain fixed number of syllables, four, five, six, seven, eight, twelve, &c. In the older writers there is no intentional rime, which first appears, we believe, among the Westerns, in Antonius Rhetor (9th century). Real metres, like those of the Greeks and Arabs, coupled in the latter case with rime, were wholly unknown to the Syrians. Hebrew poetry barely rises, as regards outward form, beyond the level of Arabic rimed prose; the Syrians, whilst destitute of rime, at least imposed upon themselves the restraint of a limited but fixed number of syllables.

31 Genesis and Exodus in Cod. Vat. cx., and five leaves of Genesis in Cod. Vat. cxx. (see Assemani, *Catal.*, iii. p. 125).

32 Cod. Vat. ciii., Brit. Mus. Add. 12144. Severus used for Genesis a commentary different from that in Cod. Vat. cx.; see Bickell, *Conspectus*, p. 19; comp. Pohlmann, *S. Ephraemi Syri Commentariorum in s. scripturam textus in codd. vatt. manuscriptus et in edit. Rom. impressus*, 2 parts, 1862-64.

33 See Bickell, *Conspectus*, p. 20.

monks who dwelt in the mountains (pp 113 131) Of metrical writings the same book contains (pp 339 354) the hymns against Julian the Apostate (pp 1 20), and the conclusion of the hymns on Paradise (wanting in the Roman ed, vol iii 598)[1] Other metrical homilies were published by Zingerle[2], but far more important, as having a real historical interest, are the *Carmina Nisibena*, or "Hymns relating to the City of Nisibis," edited by Bickell in 1866 These poems, which deal in great part with the history of Nisibis and its bishops and of adjacent cities (such as Anzit or Hanzit, Edessa, and Harrān), were composed, according to Bickell (Introd, p 6 *sq*), between the years 350 and 370 or thereabouts[3] A large quantity of hitherto unpublished matter is also contained in Lamy, *S Ephraemi Syri Hymni et Sermones*, vol i, 1882, and vol ii, 1886,—*e g*, fifteen hymns on the Epiphany, a discourse on our Lord, several metrical homilies (in particular for Passion week, the Resurrection, and New or Low Sunday), hymns on the Passover or unleavened bread (*De Azymis*) and on the Crucifixion, acts of Ephraim from the Paris MS Ancien fonds 144, commentaries on portions of the Old Testament, other metrical homilies, and hymns on the nativity, the Blessed Virgin Mary, Lent, &c The so called *Testament* of Ephraim[4] has been printed in the *Opera Græca*, ii pp 395 410 (with various readings at p 433), and again by Overbeck (*op cit*, pp 137 156)[5]

Ephraim's pupils

Notwithstanding his vast fecundity and great popularity as a theological writer, Ephraim seems not to have had any pupils worthy to take his place In the *Testament* we find mentioned with high commendation the names of Abhā, Abraham, Simeon, Mārā of Aggēl, and Zenobius of Gēzīrtā,[6] to whom we may add Isaac[7] and Jacob[8] Two, on the other hand, are named with decided reprobation as heretics, namely, Paulonas (Παυλωνᾶς) or Paulinus (Παυλῖνος) and Arwadh or Arwat[9] Of these, Abhā is cited by later writers and compilers as the author of a commentary on the Gospels, a discourse on Job, and an exposition of Ps xlix 9[10] Paulonas or Paulinus is probably the same who is mentioned by 'Abhd īshō'[11] as having written "*madhrāshē* or metrical homilies, discourses against inquirers, disputations against Marcion, and a treatise concerning believers and the creed" Zenobius, who was deacon of the church of Edessa, according to the same authority,[12] composed treatises against Marcion and Pamphylius (?), besides sundry epistles He was also the teacher of Isaac of Antioch, of whom we shall speak shortly

Balai and Cyrillōnā

Better known than any of these disciples of Ephraim are two writers who belong to the close of this century and the beginning of the next, Balai and Cyrillōnā The date of Balai or Balæus, chorepiscopus (as it seems) of the diocese of Aleppo, is fixed by his being mentioned by Bar Hebræus[13] after Ephraim, but before the time of the council of Ephesus (431) Acacius, bishop of Aleppo, whom he celebrates in one of his poems, must therefore, as Bickell says,[14] be the same Acacius who had a share in converting Rabbūlā to Christianity,[15] and died at an extreme old age (it is said 110 years) in 432 His favourite metre was the pentasyllabic, which is known by his name, as the heptasyllabic by that of Ephraim, and the twelve syllable line by that of Jacob of Serūgh Some of his poems have been edited by Overbeck in the often cited collection *S Ephraemi Syri, &c, Opera Selecta*, pp 251-336, namely, a poem on the dedication of the newly built church in the town of Kenneshrīn (Kinnesrīn), five poems in praise of Acacius, the late bishop of Aleppo, the first and eighth homilies on the history of Joseph, specimens of prayers, and a fragment on the death of Aaron[16] Cyrillōnā composed a poem "on the locusts, and on (divine) chastisement, and on the invasion of the Huns,"[17] in which he says "The North is distressed and full of wars, and if Thou be neglectful, O Lord, they will again lay me waste If the Huns, O Lord, conquer me, why do I seek refuge with the martyrs? If their swords lay me waste, why do I lay hold on Thy great Cross? If Thou givest up my cities unto them, where is the glory of Thy holy Church? A year is not yet at an end since they came forth and laid us waste and took my children captive, and lo, a second time they threaten our land that they will humble it" Now the invasion of the Huns took place in 395,[18] and thus poem must have been written in the following year (396) The few remaining writings of Cyrillōnā, composed in various metres, have been edited by Bickell in the *Z D M G*, xxvii p 566 *sq*, and translated by him in Thalhofer's *Bibliothek*, 41, pp 9 63[19] Bickell[20] is inclined to identify this Cyrillōnā with another writer of the same period, 'Abhsamyā, a priest of Edessa, Ephraim's sister's son and a pupil of Zenobius, but his reasons do not seem to us sufficient The *Chron Edess* (*B O*, i 401) states that 'Abhsamyā composed his hymns and discourses on the invasion of the Huns in 404, and Dionysius of Tell Mahrē (*B O*, i 169) speaks of him in the year 397 Bar Hebræus is less precise as to the date after mentioning the death of Chrysostom (in 407), he adds that about this time Theodore of Mopsuestia died (429) and 'Abhsamyā flourished, who "composed many discourses in the (heptasyllabic) metre of Mār Ephraim" on the invasion of the Huns[21] That 'Abhsamyā may have taken the name of Cyrillōnā at his ordination is of course possible, but it seems strange that none of these three writers should have mentioned it, if such were the case On Bar-Hebræus's statement regarding the metre which he used in his discourses we do not insist, he might easily make a mistake in such a matter

'Abhsamyā

Abbot Gregory

During the latter part of the 4th century, too, there lived in the island of Cyprus the abbot Gregory, who appears to have been sent thither from some monastery in Palestine as the spiritual head of the Syriac-speaking monks in the island[22] He cherished friendly relations with Epiphanius, afterwards bishop of Salamis or Constantia (367-403), and a monk named Theodore To these are addressed several of his discourses and letters, others are general exhortations to the monks under his charge[23] The discourses seem to be only portions of a work on the monastic life, which has not come down to us in a complete form, the "book" mentioned by 'Abhd īshō' in *B O*, iii 1, 191 In the letters he addresses Epiphanius as an older man speaking with authority to a younger, it is to be presumed, therefore, that they were written before Epiphanius became bishop

Lives of saints and martyrs

With the 5th century commences the native historical literature of Syria Previous to this time there existed martyrologies and lives of saints, martyrs, and other holy men, drawn up, in part at least, to meet the requirements of the services of the church. Such are, for example, the ancient martyrology in a manuscript of 411[24], the *Doctrine of Addai*, in its present shape a product of the latter half of the 4th century[25], the *Hypomnemata of Sharbel*, and the *Martyrdoms of Bar-samyā, Bishop of Edessa, and the Deacon Habbībh*, which all belong to about the same period[26] This sort of legendary writing was carried on to a much later date[27] The *History of Bēth Slōkh and its Martyrs*, for instance, can hardly have been composed before the 6th century, if so early[28], and the *Acts of Mārī* must be still later[29] No larger collection of such documents had, however, been attempted before the time of Mārūthā, bishop of Maipherkat,[30] a man of much weight and authority, who was twice sent by the emperor Theodosius II. on embassies to the Persian monarch Yazdegerd I., and presided at the councils of Seleucia or Ctesiphon, under the catholics Isaac and Yabh-alāhā

Marūthā of Maipherkat.

[1] The last hymn (p 351) is genuine, as the very fact of its being an acrostic shows (see Bickell, *Conspectus*, p 19), whereas the metrical homily on the baptism of Constantine (pp 355 361) is certainly spurious (Bickell, *loc cit*)

[2] *S P Ephraemi Syri Sermones duo*, Brixen, 1869 (see *B O*, i 119, col 1, No 31), *Monumenta Syriaca ex Romanis Codd collecta*, i 1 (*B O*, *loc cit*, No 30) Zingerle has rendered many of Ephraim's works into German, *e g*, *Die heilige Muse der Syrer Gesänge des h Kirchenvaters Ephraem*, 1833; *Gesänge gegen die Grübler über die Geheimnisse Gottes*, 1834, *Festkränze aus Libanons Garten*, 1846; *Des h Kirchenvaters Ephraem ausgewählte Schriften, aus d Griechischen und Syrischen uebersetzt*, 6 vols, 2d ed, 1845 47, *Die Reden des h Ephraem gegen die Ketzer*, 1850, *Reden des h Ephraem des Syrers über Selbstverleugnung und einsame Lebensweise, mit einem Briefe desselben an Einsiedler*, 1871 Translations into English have been attempted, though with less success, by Morris (*Select Works of S Ephraem the Syrian*, 1847) and Burgess (*Select Metrical Hymns and Homilies of Ephraem Syrus*, 1853, *The Repentance of Nineveh*, &c., 1853)

[30] Called by the Greeks Martyropolis, in Syriac Mēdhīnath Sāhdē, and by the Arabs Maiyāfāriķīn

respectively.[1] He is said, too, to have been a skilful physician.[2] To him 'Abhd-ishō' assigns the following works,[3]—"A book of martyrdoms, anthems and hymns on the martyrs, and a translation of the canons of the council of Nicæa, with a history of that council." The last named of these he undertook at the request of Isaac, catholicus of Seleucia, who died in 416.[4] The canons which pass under his name are those of the council of Seleucia in 410.[5] But his great work was the *Book of Martyrs*, containing accounts of those who suffered for the Christian faith under Sapor II., Yazdegerd I., and Bahrām V., to which he prefixed two discourses on the glory of the martyrs and on their torments. One of these narratives claims to have been recorded by an eye-witness, Isaiah, the son of Hadhbō (or Hadhabhū), of Arzan ('Αρζανηνή), one of the Persian king's horsemen.[6] Portions of this work survive in the British Museum in MSS. of the 5th and 6th centuries, as well as in some of later date both there and in the Vatican. They have been edited by S. E. Assemani in the first volume of the *Acta Sanctorum Martyrum*, 1748.[7] The commentary on the Gospels mentioned by Assemani is really by Mārūthā, the maphrian of Taghrith (Tekrit), who is also the author of the anaphora or liturgy.[8] Of him we shall have occasion to speak afterwards (see p. 838 *infra*). It is possible too that some of the above-mentioned

Ahā. Acts may belong not to the work of Mārūthā but to that of Ahā, the successor of Isaac in the see of Seleucia, who likewise wrote a history of the Persian martyrs and a life of his teacher 'Abhdā, the head of the school in the monastery of Dōr Kōnī or Dair-Kunnī (where the apostle Mārī was buried).[9]

Nestorian schism. About this time evil days came upon the Christian church in Syria. Paul of Samosāta, Diodore of Tarsus, and Theodore of Mopsuestia had paved the way for Nestorius. The doctrines of these writers were warmly espoused by many of the Syrian theologians; and the warfare raged for many years in and around Edessa, till it ended in the total destruction of the great Persian

Rabbūlā. school by the order of the emperor Zeno (488-489).[10] Rabbūlā, a native of Ken-neshrīn (Kinnesrīn), whose father was a heathen priest but his mother a Christian, was converted to Christianity by Eusebius, bishop of Ken-neshrīn, and Acacius, bishop of Aleppo. He voluntarily gave up all his property, forsook his wife, and became a monk in the convent of Abraham near his native city. On the death of Diogenes, bishop of Edessa, he was appointed his successor (411-412). His admiring biographer depicts him as a model bishop, and he certainly appears to have been active and energetic in teaching and preaching and attending to the needs of the poor.[11] In the theological disputes of the day he seems at first to have sided, if not with Nestorius, at least with those who were averse to extreme measures, such as John, patriarch of Antioch, and his partisans; but afterwards he joined the opposite party, and became a warm champion of the doctrines of Cyril, which he supported at the council of Edessa (431). From this time onward he was a staunch opponent of Nestorianism, and even resorted to such an extreme measure as burning the writings of Theodore of Mopsuestia. Hence Ibas in his letter to Mārī speaks of him as "the tyrant of Edessa," and Andrew of Samosāta, writing to Alexander of Hierapolis in 432, complains bitterly of his persecution of the orthodox (*i.e.*, the Nestorians). He died in August 435.[12] Of the writings of Rabbūlā but little has come down to us. There is a sermon extant in manuscript,[13] enjoining the bestowing of alms on behalf of the souls of the dead and prohibiting all feasting on the occasion of their commemoration. Another sermon, preached at Constantinople, is directed against the errors of Nestorius.[14] There are also extant canons and orders addressed to the monks and clergy of his diocese,[15] and a number of hymns, of which Overbeck has printed some specimens.[16] He also rendered into Syriac Cyril's treatise *De Recta in Dominum nostrum J. C. Fide ad Theodosium Imperatorem*[17] from a copy which was sent to him by the author.[18] His biographer intended to translate into Syriac a collection of forty-six of his letters, written in Greek "to priests and emperors and nobles and monks,[19]" but of these only a few remain, *e.g.*, to Andrew of Samosāta, condemning his treatise against the twelve anathemas of Cyril[20]; to Cyril, regarding Theodore of Mopsuestia[21]; and to Gemellinus of Perrhē, about certain monks and other persons who misused the sacred elements as ordinary food.[22]

Rabbūlā was succeeded in the see of Edessa (435) by Ihībhā or Ibas Hībhā (Græcized Ibas),[23] who in his younger days had been one of the translators of Theodore's works in the Persian school.[24] This, with his letter to Mārī the Persian[25] and other utterances, led to his being charged with Nestorianism. He was acquitted by the two synods of Tyre and Beirūt, but condemned by the second council of Ephesus (449),[26] and Nonnus was substituted in his room. He was restored, however, at the end of two years by the council of Chalcedon, and sat till October 457, when he was succeeded by Nonnus,[27] who in his turn was followed by Cyrus in 471. Besides the writings above mentioned, 'Abhd-ishō' attributes to Ibas[28] "a commentary on Proverbs, sermons and metrical homilies (*madhrāshē*), and a disputation with a heretic", but none of these appear to have come down to us.

During this stormy period the name of Acacius, bishop of Āmid, Acacius. is mentioned as the author of certain epistles.[29] The great event of Āmid. his life, which is referred by Socrates (bk. vii. 21) to the year 422, is thus briefly recorded in the *Martyrologium Romanum Gregorii XIII* (Malines, 1859), 9th April. "Amidæ in Mesopotamia sancti Acatii episcopi, qui pro redimendis captivis etiam ecclesiæ vasa conflavit ac vendidit." The said captives were Persian subjects, who were thus ransomed and sent back to their king and country.[30] Acacius was doubtless a favourer of Nestorianism, for his letters were thought worthy of a commentary by Mārī, bishop of Bēth Hardashēr,[31] the correspondent of Ibas.[32]

About the same time rose one of the stars of Syriac literature, Isaac of Isaac, commonly called the Great, of Antioch.[33] He was a native Antioch. of Āmid, but went as a young man to Edessa, where he enjoyed the teaching of Zenobius, the disciple of Ephraim.[34] Thence he removed to Antioch, where he lived as priest and abbot of one of the many convents in its immediate neighbourhood. In his younger days he would seem to have travelled farther than most of his countrymen, as it is stated that he visited Rome and other cities.[35] With this agrees what is recorded by Dionysius of Tell-Mahrē[36] as to his having composed poems on the secular games celebrated at Rome in 404, and on the capture of the city by Alaric in 410, which shows that he took a more than ordinary interest in the Western capital. Isaac died in or about 460, soon after the destruction of Antioch by the earthquake of 459, on which he wrote a poem.[37] Isaac's works are nearly as voluminous and varied as those of Ephraim, with which indeed they are often confounded in MSS. and in the Roman edition.[38] They were gathered into one corpus by the Jacobite patriarch John bar Shūshan or Susanna, who began in his old age to transcribe and annotate them, but was hindered from completing his task by death (1073).[39] Assemani has given a list of considerably more than a hundred metrical homilies from MSS. in the Vatican.[40] Of these part of one on the Crucifixion was edited by Overbeck,[41] and another on the love of learning by Zingerle.[42] But it has been left to Bickell to collect and translate all the extant writings of this Syrian father and to commence the publication of them. Out of nearly 200 metrical homilies his first volume contains in 307 pages only fifteen, and his second brings

[42] *Monumenta Syriaca*, i. 13-20; see also some extracts in Zingerle's *Chrestom. Syr.*, pp. 299 *sq.*, 387 *sq.* Zingerle has translated large portions of the homilies on the Crucifixion into German in the *Tubinger Theolog. Quartalschrift*, 1870, i. Further, Cardāhī, *Liber Thes.*, pp. 21-25.

ns in 353 pages only as far as No 37.[1] Some of these poems have a certain historical value, such as the second homily on fasting, probably written soon after 420,[2] the two homilies on the destruction of the town of Bēth Ḥūr by the Arabs (c. 457),[3] and the two against persons who resort to soothsayers.[4] Others possess some interest as bearing on the theological views of the author, who combats the errors of Nestorius and Eutyches.[5] One of the longest and most wearisome is a stupendous poem of 2137 verses on a parrot which proclaimed ἅγιος ὁ Θεός in the streets of Antioch.[6] Another on repentance runs to the length of 1929 verses. In prose Isaac seems to have written very little; at least Bickell[7] mentions only "various questions and answers, an ascetic narrative and ascetic rules."

Dādhā. Concerning Isaac's contemporary Dādhā we know but little.[8] He was a monk from the neighbourhood of Āmid, who was sent by the people of that city to Constantinople on account of the ravages of war and famine, to obtain remission of the taxes or some similar relief, and was well received by the emperor. He is said to have written about three hundred tracts on various topics connected with the Scriptures and on the saints, besides poems (*madhrāshē*).

Simeon the Stylite. Here, too, we may record the name of Simeon the Stylite, who died in 459 or soon after.[9] The Monophysites contend that he held their theological views, and accordingly we find in a MS of the 8th century a letter of his to the emperor Leo regarding Theodoret of Cyrrhus, who had come to him and tried to pervert him to the opinions of the Dyophysites,[10] and in another MS, of about the same age, three letters to the emperor Leo, to the abbot Jacob of Kaphrā Rĕḥīmā, and to John I., patriarch of Antioch, all tending to prove that he rejected the council of Chalcedon.[11] A third MS, of the 6th century, contains certain "precepts and admonitions" addressed by him to the brethren.[12] There is extant in very old MSS[13] a *Life* of Simeon, full of absurd stories, which has been edited by S. E. Assemani in the *Acta Sanctorum Martyrum*, vol. ii. 268 *sq.* At the end of it (p. 394) there is a letter by one Cosmas,[14] priest of the village of Panīr, written in the name of his congregation to the Stylite, promising implicit obedience to all his precepts and orders, and requesting his prayers on their behalf; but there is nothing whatever to show that this Cosmas was the author of the *Life* or had any share in writing it.[15]

Dādh-īshō'. About this time we find Dādh-īshō', the catholicus of Seleucia (421-456),[16] composing his commentaries on the books of Daniel, Kings, and Bar-Sīrā or Ecclesiasticus.[17] But the chief seat of Nestorian scholarship and literary activity was still the Persian school of Edessa, where Bar-saumā and other teachers were actively engaged in defending and propagating their peculiar tenets.

Bar-saumā of Nisibis. Bar-saumā, if we may believe the scurrilous Monophysite Simeon of Bēth Arshām,[18] was originally the slave of one Māra of Bēth Kardū,[19] and bore at Edessa the nickname of *Sāḥē bēth ḳĕnayyā*.[20] He was at Edessa in 449, when his expulsion was called for by the rabble.[21] In what year it actually took place we do not know, but we afterwards find him busy in the East under the catholicus Bābhōyah or Babuæus (from about 457 to 483)[22] and his successor Acacius (from about 484 to 496), during which period he was bishop of Nisibis.[23] Of his personal character and work this is not the place to attempt to form a judgment; but the reader should beware of placing implicit trust in the statements of bitter and unscrupulous theological opponents like Simeon of Bēth Arshām, Bar Hebræus, and Assemani. Bar-saumā does not appear to have written much, as 'Abhd-īshō'[24] mentions only parænetic and funeral sermons, hymns of the class called *turgāmē*,[25] metrical homilies (*madhrāshē*), letters, and an anaphora or liturgy.

Narsai. A fellow worker with him both at Edessa and Nisibis was Narsai (or Narsē), of Ma'allethā or Ma'althāyā,[26] whom Simeon of Bēth Arshām calls "the Leper,"[27] whereas his co-sectarians style him "the Harp of the Holy Spirit." He was especially famous as a writer of hymns and other metrical compositions, his favourite metre being that of six syllables.[28] He fled from Edessa to escape the wrath of the bishop Cyrus (471-498), probably in the year 489, and died at Nisibis early in the next century.[29] Narsai's works, as enumerated by 'Abhd-īshō',[30] consist of commentaries on the first four books of the Pentateuch, Joshua, Judges, and Ecclesiastes, Isaiah and the twelve minor prophets, Jeremiah, Ezekiel, and Daniel, twelve volumes of metrical discourses (360 in number),[31] a liturgy, expositions of the order of celebrating the Eucharist and of baptism, parænetic and funeral sermons, hymns of several sorts,[32] and a book entitled *On the Corruption of Morals*.

Mārī the Persian. Mārī the Persian has been already mentioned as the correspondent of Ibas. Besides the commentary on the epistles of Acacius (see Persian above, p. 829), he wrote a commentary on the book of Daniel and a controversial treatise against the magi[33] of Nisibis.[34]

Acacius. Acacius, catholicus of Seleucia (c. 484-496), composed discourses on fasting and on the faith, as also against the Monophysites, and translated into Persian for the king Kawādh a treatise on the faith by Elisha, bishop of Nisibis, the successor of Bar-saumā.[35] Assemani tries hard to cleanse Acacius from the stain of Nestorianism, but, as Abbeloos remarks,[36] "vereor ne Æthiopem dealbare voluerit, nam omnia tum Jacobitarum tum Nestorianorum monumenta, quæ ipse recitat, contrarium testantur."

Mīkhā. Mīkhā or Micah, another member of the band of exiled Edessenes,[37] became bishop of Lāshōm.[38] He wrote a commentary on the books of Kings, a discourse on his predecessor Sabhr-īshō', another on a person whose name is written Kntropos,[39] and a tract entitled *The Five Reasons of the Mautĕbhē*.[40] To these writers may be added two others,—

Yazīdādh. Yazīdādh,[41] who is also said to have belonged to the Edessene school and to have compiled "a book of collectanea (*luḳḳāṭē*),"[42] and Ara, who wrote a treatise against the magi or Persian priesthood, and another against the followers of Bardesānes with the contemptuous title of *Ḥubhshōsh yāthā* or "the Beetles."[43]

Translations from Greek. The Persian school at Edessa was, as we have already hinted, the chief seat of the study of Greek during the early days of the Syrian literature. Of the most ancient translators we know no thing, but the oldest MSS are Edessene, viz., the famous MS in the British Museum, Add. 12150, dated towards the end of 411, and the equally well known codex at St Petersburg, written in 462. The former contains the *Recognitiones* of Clement, the discourses of Titus of Bostra against the Manichees, the *Theophania* of Eusebius, and his history of the confessors in Palestine; the latter, the *Ecclesiastical History* of Eusebius. Now, as the text presented by these MSS has evidently passed through the hands of several successive scribes, it seems to follow that these books were translated into Syriac in the lifetime of the authors themselves, or very soon after, for Eusebius died in 340 and Titus in 371. Very likely the one or the other may have had a friend at the chief seat of Syriac learning who was willing to perform for him the same kind office that Rabbūlā under took for Cyril.[44] A little later on our information becomes fuller and more exact.

Ma'nī. Ma'nā,[45] a Persian by race,[46] from the town of Bēth Hardashēr, was resident at Edessa in the earlier part of the 5th century, and is mentioned by Simeon of Bēth Arshām among the distinguished Nestorian scholars whom he holds up to ridicule.[47] His nickname was *Shāthē ḳĕṭmā*, "the Drinker of Ashes." Ma'nā devoted himself to the task of translating into Syriac the commentaries of Theodore of Mopsuestia during the lifetime of that great theologian, who did not die till 429. He must, however, have withdrawn from Edessa at a comparatively early period, as he was bishop of Persis[48] prior to 420, in which year (the last of his reign) Yazdegerd I. made him catholicus of Seleucia, in succession to Yabh-alāhā.[49] He had, it appears, translated a number of books from Syriac into

1 *S. Isaaci Antiocheni, Doctoris Syrorum, Opera Omnia*, ed. G. Bickell, part i., 1873; part ii., 1877. We hope soon to receive the remaining parts at his hands.

24 *Ibid.*, iii. 1, 66. 25 See Badger, *The Nestorians*, ii. 19.
26 Hoffmann, *Auszüge*, p. 208; Badger, *The Nestorians*, i. 174.
27 Perhaps in a spiritual sense only, though Assemani thinks otherwise; see *B. O.*, i. 352 and note 5, 354; iii. 1, 63. 28 *B. O.*, iii. 1, 65, note 6.

29 See Bar Hebræus, *Chron. Eccles.*, ii. 77; *B. O.*, ii. 407. 30 *B. O.*, iii. 1, 65, 66.
31 Some of these are probably contained in the Berlin MSS Sachau 174-176 (*mīmrē dha-medhabbĕrānūthā*, on the life of our Lord) and 219 (two poems on Joseph, and two others).
32 Two of them are often found in the Nestorian Psalter. See, for example, Brit. Mus. Add. 7156 (Rosen, *Catal.*, p. 12, col. 2, No. 3a, c) and Add. 17219 (Wright, *Catal.*, p. 134, col. 2, No. 3 a, c).
33 *Mĕghūshē*, from *magu*, *mag*, the Persian priesthood, the head of whom in each district was the *magupat*, *mogpet*, or *mōbedh*. See Nöldeke, *Geschichte der Perser und Araber zur Zeit der Sasaniden*, p. 450. 34 *B. O.*, iii. 1, 171.
35 *Ibid.*, iii. 1, 389. Elisha is called by some authorities Hosea; *ibid.*, ii. 407, iii. 1, 429. 36 Bar Hebræus, *Chron. Eccles.*, ii. 71, note 2.
37 *B. O.*, i. 352-353. His enemies gave him the nickname of Dagon.
38 Now Lāsim, a short distance south-west of Dāḳūḳ or Ṭāūḳ, in Bēth Garmai; see Hoffmann, *Auszüge*, p. 274.
39 Vocalized Kentropos or Kantropos; *B. O.*, iii. 1, 170, 1. 2.
40 Meaning probably the division of the Psalter into three kathismata (Bickell, *Conspectus*, p. 92); see *B. O.*, iii. 1, 71, note 2.
41 For Yazed-dādh or Īzid-dādh, like Yazed-panāh, Yazed-bōzēdh; see Hoffmann, *Auszüge*, p. 88, No. 796. 42 *B. O.*, iii. 1, 226.
43 Of Ara we seem to know absolutely nothing; his very *floruit* is uncertain, and he may have belonged to the previous century; *B. O.*, iii. 1, 230.
44 See above, p. 829, and compare Merx, "De Eusebianæ Historiæ Eccles. Versionibus, Syriaca et Armeniaca," in *Atti del IV° Congresso Internazionale degli Orientalisti*, Florence, 1880, i. 199 *sq.*, especially pp. 201-202. It may here be mentioned that the literature of Armenia is largely indebted in its earliest days to that of Syria, not only for the translation of Eusebius's *Eccles. History*, but for such works as the *Doctrine of Addai* and the *Homilies* of Aphraates, wrongly ascribed to Jacob of Nisibis.
45 So the name is written by Mārī bar Shĕlēmōn, whom Assemani follows, *B. O.*, iii. 1, 376, pronouncing it, however, Ma'nē or Maanes. Elias of Nisibis also gives Ma'nā (Bar Hebræus, *Chron. Eccles.*, ii. 53, note 2), but Bar Hebræus himself (*loc. cit.*) has Maghnā, which Abbeloos Latinizes Magnes.
46 His Persian name is unknown to us. 47 *B. O.*, i. 352.
48 Bar Hebræus, *Chron. Eccles.*, ii. 55, 63. 49 *B. O.*, ii. 401.

Persian (Pahlavi), and thus probably ingratiated himself with the king.[1] However, he soon fell under the royal displeasure, was degraded from his office, and ordered to retire to Persis, where he resumed his former duties,[2] and so incurred the anger of Yazdegerd's successor, Pērōz.[3] Ma'nā's work, the exact extent of which is not known to us, was carried on and completed by other members of the Persian school,—such as Acacius the catholicus and Yazdādh, John of Bēth Garmai, afterwards bishop of Bēth Sīrī (or Sērāï?), and Abraham the Mede, disciples of Narsai, Mīkhā, afterwards bishop of Lāshōm in Bēth Garmai, Paul bar Kakai (or Kakī), afterwards bishop of Lādhān in al Ahwāz, 'Abhshotā (?) of Nineveh, and others,[4]—who are expressly said to have "taken away with them" (*appēk 'ammĕhōn*) from Edessa, and disseminated throughout the East, the writings of Theodore and Nestorius.[5] Ibas himself was one of these translators in his younger days (see above, p. 829). About the same time with Ma'nā's translations began the Aristotelian studies of the Syrian Nestorians. To understand and translate the writings of their favourite Greek theologians, Paul of Samosāta, Diodore of Tarsus, Theodore of Mopsuestia, and Nestorius himself, not to mention Theodoret[6] of Cyrrhus, required a considerable knowledge of the Aristotelian logic. Hence the labours of

Probus Probus (Πρόβος, in Syriac *Prōbhos*, *Prōbhā*, or *Prōbhē*), who translated and commented on the Περὶ ἑρμηνείας,[7] and probably treated in a similar manner other parts of the *Organon*.[8] It is not easy to fix his date precisely. 'Abhd ishō'[9] makes him contemporary with Ibas and another translator named Kūmī. If the Berlin MS. Sachau 226 can be trusted, he was archdeacon and archiater at Antioch. Hoffmann[10] has assigned reasons for supposing him not to be anterior to the Athenian expositor Syrianus (433-450?).

Monophysite schism. Whilst the Nestorians were thus making rapid progress all over the East, another heresy was spreading in the West. Eutyches had found followers in Syria, among others Bar saumā the archimandrite, a man famous for his piety and asceticism,[11] who repre-

Bar saumā, the archimandrite. sented the abbots of Syria at the second council of Ephesus,[12] and was afterwards condemned by the council of Chalcedon.[13] He died in 458.[14] His life was written by his disciple Samuel, in much the same style as that of Simeon Stylites, and is extant in several MSS. in the British Museum.[15] His memory has always been held in the greatest reverence by the Jacobites. The Armenians, according to Assemani,[16] keep his commemoration on the 1st of February, the Syrians and Copts on the 3d. The decisions of the council of Chalcedon produced an immediate and irreparable breach in the Eastern Church; and the struggle of the rival factions was carried on with desperate fury alike at Constantinople, Antioch, and Alexandria. In Syria the persecution of the Monophysites was violent during the years 518-521, under the emperor Justin, and again in 535 and the following years, under Justinian, when they seemed in a fair way of being completely crushed by brute force.

Jacob of Sĕrūgh. The first name to be mentioned here, as belonging to both the 5th and 6th centuries, is that of Jacob of Sĕrūgh, one of the most celebrated writers of the Syrian Church,[17] "the flute of the Holy Spirit and the harp of the believing church." There are no less than three biographies of him extant in Syriac,—the first, by his namesake Jacob of Edessa;[18] the second, anonymous;[19] the third, a lengthy metrical panegyric, said to have been written for his commemoration[20] by a disciple of his named George.[21] This, however, seems, from the whole tone of the composition, to be unlikely, and Bickell is probably right in supposing the author to be George, bishop of Sĕrūgh, a contemporary of Jacob of Edessa.[22] Jacob was born at Kurtam, "a village on the river Euphrates," probably in the district of Sĕrūgh, in 451. His father was a priest, and, as his parents had been childless for many years, his birth was regarded as a reward for their alms, prayers, and vows. Whether he was educated at Edessa or not, he soon acquired a great reputation for learning and eloquence. He appears to have led a life of quiet work and study, and to have devoted himself in particular to literary composition. He became periodeutes of Hawrā in Sĕrūgh, whence we find him writing to the Christians of Najrān, and to the city of Edessa when threatened by the Persians.[23] As periodeutes he is mentioned in eulogistic terms by Joshua the Stylite[24] (503). In 519, when sixty-eight years old, he was made bishop of Batnān, the chief town of Sĕrūgh, where he died on 29th November 521. Jacob's prose writings are not numerous.[25] A liturgy is ascribed to him, and an order of baptism, the former of which has been translated by Renaudot,[26] the latter edited by J. A. Assemani.[27] Further, he composed six festal homilies, one of which has been published by Zingerle,[28] who has also translated the whole of them into German;[29] a discourse showing that we should not neglect or despise our sins;[30] another for the night of Wednesday in the third week of Lent;[31] and some short funeral sermons.[32] To him we also owe a life of Mār Hannīnā (died in 500), addressed to one Philotheus.[33] Of his letters a considerable number have been preserved, particularly in two MSS. in the British Museum, Add. 14587 and 17163, ff. 1-48.[34] Of these Martin has edited and translated the three epistles to the monks of the convent of Mār Bassus at Hārim,[35] with a reply by the monks, and another letter to Paul, bishop of Edessa, from all of which it is evident that Jacob always was a Monophysite, and continued such to his death.[36] The letter to Stephen bar Sūdh-ailē is given, with an English version, by Frothingham;[37] and that to the Himyarite Christians of Najrān has been edited and translated by Schröter in the *Z. D. M. G.*, xxxi. (1877), p. 360 *sq.* It belongs to the year 519 or 520.[38] According to Bar-Hebræus,[39] he also wrote "a commentary on the six centuries of Evagrius, at the request of Mār George, bishop of the (Arab) tribes, who was his disciple." As George, bishop of the Arab tribes, was a contemporary of Jacob of Edessa, this statement seems to rest on some misapprehension; at all events no such work now exists. The paucity of Jacob's prose writings is more than compensated by a flood of metrical compositions, mostly in dodecasyllabic verse, or the four-syllable line thrice repeated. "He had," says Bar-Hebræus,[40] "seventy amanuenses to copy out his metrical homilies, which were 760[41] in number, besides commentaries and letters and odes (*madhrāshē*) and hymns (*sughyāthā*)." Of these homilies more than the half have perished, but nearly 300 are still preserved in European collections.[42] Very few of them have as yet been published, though many of them are by no means devoid of interest.[43] Indeed Jacob is on the whole far more readable than Ephraim or Isaac of Antioch.

Philoxenus of Mabbōgh. Very different from the gentle and studious bishop of Sĕrūgh was his contemporary and neighbour, the energetic and fiery Philoxenus of Mabbōgh. Aksĕnāyā or Philoxenus was a native of Tahal, somewhere in Bēth Garmai, and studied at Edessa in the time of Ibas.[44] He was ordained bishop of Hierapolis or Mabbōgh (Manbij) by Peter the Fuller, patriarch of Antioch, in 485, and devoted his

[43] Zingerle has given extracts in the *Z. D. M. G.*, xii., xiii., xiv., xv., and xx., and in his *Chrest. Syr.*, pp. 360-386. The homily on Simeon Stylites has been published by Assemani in the *Acta SS. Martyrum*, ii. 230 *sq.*; that on virginity, fornication, &c., by Overbeck, *S. Ephraemi Syri*, &c., *Opera Selecta*, p. 385 *sq.*; that on Alexander the Great (perhaps spurious) by Knös, *Chrest. Syr.*, 1807, p. 66 *sq.* (there is a German translation by A. Weber, *Des Mar Yakūb Gedicht über den gläubigen König Alexandrus*, 1852); on Habībh and on Guryā and Shamūnā, Edessene martyrs, with a *sūghīthā* on Edessa, by Cureton, *Ancient Syriac Documents*, pp. 86-98; on Sharbīl by Mösinger, *Mon. Syr.*, ii. 52; and on the chariot of Ezekiel, with an Arabic translation, *ibid.*, p. 76; two on the Blessed Virgin Mary by Abbeloos, *De Vita*, &c., pp. 203-301; on Jacob at Bethel, on our Lord and Jacob, the church and Rachel, Leah and the synagogue, on the two birds (Lev. xiv. 4), on the two goats (Lev. xvi. 7), and on Moses' vail, (Exod. xxxiv. 33) by Zingerle, *Mon. Syr.*, i. 21-90; on Tamar by J. Zingerle, 1871; on the palace which St Thomas built for the king of India in Heaven (perhaps spurious) by Schröter, in *Z. D. M. G.*, xxv. 321, xxviii. 584; on the fall of the idols by Martin, in *Z. D. M. G.*, xxix. 107; on the baptism of Constantine (perhaps spurious) by Frothingham, in the *Atti della Accademia dei Lincei* for 1881-82 (Rome, 1882). Bickell has translated into German (in Thalhofer, *Bibl.*, 58) the first homily on the Blessed Virgin Mary, that on Jacob at Bethel, on Moses' vail, and on Guryā and Shamūnā. Some of Jacob's homilies are extant in Arabic, and even in Ethiopic. His prayer as a child see in Overbeck, *op. cit.*, p. 382.

[44] *B. O.*, i. 353.

life to the advocacy of Monophysite doctrine. Twice he visited Constantinople in the service of his party, and suffered much (as was to be expected) at the hands of its enemies, for thus he writes in later years to the monks of the convent of Sĕnūn near Edessa: "What I endured from Flavian and Macedonius, who were arch bishops of Antioch and of the capital, and previously from Cal endion, is known and spoken of everywhere. I keep silence both as to what was plotted against me in the time of the Persian war among the nobles by the care of the aforesaid Flavian the heretic, and also as to what befell me in Edessa, and in the district of the Apameans, and in that of the Antiochians, when I was in the con vent of the blessed Mār Bassus, and again in Antioch itself, and when I went up on two occasions to the capital, like things were done to me by the Nestorian heretics."[1] He succeeded at last in getting rid of his enemy Flavian in 512, and in the same year he presided at a synod in which his friend Severus was ordained patri arch of Antioch.[2] His triumph, however, was but short-lived, for Justin, the successor of Anastasius, sentenced to banishment in 519 fifty four bishops who refused to accept the decrees of the council of Chalcedon, among whom were Severus, Philoxenus, Peter of Apamea, John of Tellā, Julian of Halicarnassus, and Māra of Āmid. Philoxenus was exiled to Philippopolis in Thrace,[3] and afterwards to Gangra in Paphlagonia, where he was murdered about the year 523. The Jacobite Church commemorates him on 10th December, 18th February, and 1st April. Philoxenus, however, was something more than a man of action and of strife: he was a scholar and an elegant writer. Even Assemani, who never misses an opportunity of reviling him,[4] is obliged to own (*B O*, ii 20) "scripsit Syriace, si quis alius, elegantissime, atque adeo inter optimos hujusce linguæ scriptores a Jacobo Edesseno collocari meruit." Unfortunately scarcely any of his numerous works have as yet been printed.[5] To him the Syriac Church owed its first revised translation of the Scriptures (see above, p 825), and he also drew up an anaphora[6] and an order of baptism.[7] Portions of his commentaries on the Gospels are contained in two MSS in the British Museum.[8] Besides sundry sermons, he composed thirteen homilies on the Christian life and character, of which there are several ancient copies in the British Museum. Of his controversial works the two most important are a treatise *On the Trinity and the Incarnation* in three discourses,[9] and another, in ten discourses, showing "that one (Person) of the Trinity became incarnate and suffered"[10], but there are many smaller tracts against the Nestorians and Dyophysites.[11] His letters are numerous and may be of some value for the ecclesiastical history of his time. Assemani enumerates and gives extracts from several of them,[12] but none of them have as yet been printed in full, with the exception of that to Abū Nafir of Hērtā (al Hīrah),[13] to the monks of Tell-'Addā,[14] and to the priests Abraham and Orestes of Edessa regarding Stephen bar Sūdh ailē.[15]

Stephen bar Sūdh-ailē

Contemporary with Jacob of Sĕrūgh and Philoxenus of Mabbōgh was the pantheist Stephen bar Sūdh-ailē,[16] with whom both of these writers corresponded,[17] and regarding whom the latter wrote the above-mentioned letter to the priests Abraham and Orestes. This man was the author of the work entitled *The Book of Hierotheus*, which he published under the name of Hierotheus, the teacher of St Dionysius of Athens,[18] and exercised a strong influence on the whole pseudo Dionysian literature.[19] Theodosius, patriarch of Antioch (887 896), wrote a commentary on the *Hierotheus*.[20] Bar Hebræus too made copious extracts from it, which he arranged and illustrated with a commentary chiefly derived from that of Theodosius.[21]

Stylite

At the same time with Jacob of Sĕrūgh and Philoxenus, and in the same neighbourhood, lived one of the earliest and best of the Syrian historians, the Stylite monk Yēshū' or Joshua. Of him we know nothing but that he originally belonged to the great convent of Zuknīn near Āmid, that at the beginning of the 6th century he was residing at Edessa, and that he dedicated his *Chronicle* of the Persian War[22] to an abbot named Sergius. His approving mention of Jacob[23] and Philoxenus[24] shows that he was a Monophysite. Joshua's *Chronicle* would have been entirely lost to us, had it not been for the thoughtfulness of a later writer, Dionysius of Tell-Mahrē (d 845), who incorporated it with his account of the reign of Anastasius in the smaller redaction of his own *History*. It was first made known to us by Assemani (*Bibl Orient*, i 260 283), who gave a copious analysis with some extracts, and it is now generally acknowledged to be one of the best, if not actually the best, account of the great war between the Persian and Byzantine empires during the reigns of Kawādh and Anastasius (502 506).[25] To the indefatigable Abbé Martin belongs the credit of publishing the *editio princeps* of the Syriac text.[26] The work was written in the year 507, immediately after the conclusion of the war, as is shown by the whole tone of the last chapter, and it is much to be regretted that the author did not carry out his intention of con tinuing it, or, if he did, that the continuation has perished.

Simeon of Kūkāyā

The interest which Jacob of Sĕrūgh took in every branch of literature was the means of bringing into notice a hymn-writer of humble rank, the deacon Simeon Kūkāyā, a potter by trade, as his name denotes. This man lived in the village of Gēshīr,[27] not far from the convent of Mār Bassus, and while he worked at his wheel composed hymns, which he wrote down on a tablet or a scroll, as might be convenient. Jacob heard of him from the monks, paid him a visit, admired his hymns, and took away some of them with him, at the same time urging the author to continue his labours.[28] A specimen of these *Kūkāyāthā* has been preserved in the shape of nine hymns on the nativity of our Lord, Brit Mus Add 14520, a MS of the 8th or 9th century.[29]

Simeon of Bēth Arshām

About the same time flourished Simeon, bishop of Bēth Arshām,[30] commonly called *Dārōshā Phārsāyā* or "the Persian Disputant." This keen Monophysite[31] was one of the few representatives of his creed in the Persian territory, and exhibited a wonderful activity, mental and bodily, on behalf of his co-religionists, traversing the Babylonian and Persian districts in all directions, and disputing with Manichees, Daisanites, Eutychians, and Nestorians.[32] After one of these disputations, at which the Nestorian catholicus Bābhai (498-503) was present,[33] Simeon was made bishop, a dignity which he had declined on several previous occasions. He visited Hērtā (al-Hīrah) more than once, and died during his third residence at Constantinople, whither he had come to see the empress Theodora.[34] Assemani states, on the authority of Dionysius of Tell Mahrē, that he was bishop of Bēth Arshām from 510 to 515, but the Syriac passage which he quotes merely gives the *floruit* of 510. If, how ever, the statements of John of Ephesus, who knew him personally, be correct, he was probably made bishop before 503, the date of Bābhai's decease.[35] His death must have taken place before 518, in which year Theodora departed this life. Besides an anaphora,[36] we possess only two letters of Simeon, which are both of consider-able interest. The one is entitled *On Bar saumā and the Sect of the Nestorians*[37], it deals with the origin and spread of Nestorianism in the East, but from the bitterest and narrowest sectarian point of view.[38] The other, which is much more valuable, is addressed to Simeon, abbot of Gabbūlā,[39] and treats of the persecution of the Christians at Najrān by Dhū Nuwās, king of al Yaman, in the year 523.[40] It is dated 524, in which year the writer was himself at Hērtā (al Hīrah).

1 *Ibid*, ii 15, comp the mention of him at Edessa by Joshua the Stylite in 498, *Chronicle*, ed Wright, chap xxx. 2 *Ibid*, pp 17, 18.
3 He was living there when he wrote to the monks of Sĕnūn in 522, *B O*, ii 20.
4 "Scelestissimus hæreticus" (*B O*, ii 11), "flagitiosissimus homo" (p 12), "ecclesiam Dei tanquam ferus aper devastaverit" (p 18).
5 *B O*, ii 23 *sq*, Wright, *Catal*, Index, p 1315.
6 Renaudot, ii 310, *B O*, ii 24. 7 *B O*, ii 24.
8 Add 17126, dated 511, and Add 14534, probably of equal age.
9 The Vatican MS (Assemani, *Catal*, iii p 217, No cxxxvii) is dated 504, see *B O*, ii 25 *sq*.
10 *B O*, ii 27 *sq*. The Vatican MS is dated 581, that in the British Museum Add 12164 *is at least as old*.
11 See *B O*, ii 45, Nos 15 17, and Wright, *Catal*, p 1315.
12 *B O*, ii 30 46. Others may be found in Wright, *Catal*, p 1315.

39 Al Jabbūl. Or is it Jablul, on the east bank of the Tigris, between an-Nu'mānyah and Wāsit?
40 First printed in *B O*, i 364 *sq*, according to the text offered by John of Ephesus in his *History*. There is, however, a longer and better text in a MS

John bar Cursus To the same age and sect as Simeon belonged John bar Cursus (Κούρσος),[1] bishop of Tellā or Constantina He was a native of Callinicus (ar Rakkah), of good family, and was carefully educated by his widowed mother, who put him into the army at the age of twenty He would not, however, be hindered from quitting the service after a few years and becoming a monk Subsequently, in 519, he was raised to the dignity of bishop of Tellā, whence he was expelled by Justin in 521 In 533 he visited Constantinople, and on his return to the East was seized by his enemies in the mountains of Sinjār, and dragged to Nisibis, Rās'ain, and Antioch, where he died in 538, at the age of fifty five, having been for a year and six days a close prisoner in the convent of the Comes Manassē by order of the cruel persecutor Ephraim, patriarch of Antioch (529 514) His life was written by his disciple Elias (of Dārā?) [2] The Jacobite Church commemorates him on the 6th of February Canons by John of Tellā are extant in several MSS in the British Museum and elsewhere [3] The questions put to him by Sergius with his replies have been published by Lamy [4] His creed or confession of faith, addressed to the convents in and around Tellā, is found in Brit Mus Add 14549 (*Catal* , p 431), and an exposition of the Trisagion in Cod Vat clix (*Catal* , iii 314) and Bodl Marsh 101 (Payne Smith, *Catal* , p 463, No 20)

Mārā III of Āmid Another of the unfortunate Monophysite bishops whom Justin expelled from their sees (in 519) was Mārā of Āmid, the third bishop of the name He was banished, with his syncelli and with Isidore, bishop of Ken-neshrīn (Kinnesrīn), in the first instance to Petra, but was afterwards allowed to go to Alexandria,[5] where he died in about eight years [6] According to Assemani (*Bibl Orient* , ii 52 , comp p 169), Mārā wrote a commentary on the Gospels It would seem, however, from a passage of Zacharias Rhetor,[7] that Mārā merely prefixed a short prologue in Greek to a copy of the Gospels which he had procured at Alexandria,[8] and that this MS contained (as might be expected) the pericope on the woman taken in adultery (John viii 2 11) That the Syriac translations of the prologue and pericope were made by himself is nowhere stated

John bar Aphtōnyā Yet another sufferer at the hands of Justin was John bar Aphtōnyā (Aphthonia, his mother's name) [9] He was abbot of the convent of St Thomas at Seleucia (apparently in Pieria, on the Orontes), which was famous as a school for the study of Greek literature Being expelled thence, he removed with his whole brotherhood to Ken neshrē (the Eagles' Nest) on the Euphrates, opposite Europus (Jerābis), where he founded a new convent and school that more than rivalled the parent establishment, for here Thomas of Heraclea, Jacob of Edessa, and others received their training in Greek letters [10] His *Life*, written by a disciple, is extant in Brit Mus Add 12174 [11] According to Dionysius of Tell Mahrē, as quoted by Assemani (*loc cit*), he died in 538 He wrote a commentary on the Song of Songs, some extracts from which are preserved in a *Catena Patrum* in the British Museum (Add 12168, f 138a), a considerable number of hymns,[12] and a biography of Severus of Antioch,[13] which must have been his last work, as he survived Severus only about nine months

Jacob Burdĕ'ānā We now come to the man who was the real founder of the Jacobite Church in Asia, and from whom the Jacobites took their name, Jacob bar Theophilus, surnamed "Burdĕ'ānā"[14], because his dress consisted of a *barda'thā* or coarse horse-cloth, which he never changed till it became quite ragged [15] What Assemani could learn regarding him he has put together in the *Bibl Orient* , ii 62-69[16], since then our sources of information have been largely increased, especially by the publication of the *Ecclesiastical History* of John of Ephesus by Cureton and of the same writer's *Lives* in Land's *Anecd Syr* , ii [17] On a careful study of these is based Kleyn's excellent book *Jacobus Baradæus, de Stichter der Syrische Monophysietische Kerk*, 1882 Jacob was the son of Theophilus bar Ma'nū, a priest of Tellā or Constantina, and the child of his old age After receiving a good education, he was entered at the monastery of Pĕsīltā (or the Quarry),[18] close by the village of Gum mĕthā in Mount Īzalā (or Īzlā),[19] not far from Tellā About 527 528 he and another monk of Tellā, named Sergius, were sent to Constantinople in defence of their faith, and, being favourably received by the empress Theodora, they remained there fifteen years Meantime the persecutions of the Monophysites, more especially that of 536 537 by Ephraim of Antioch, seemed to have crushed their party, despite all the efforts of the devoted John of Tellā and John of Hephæstus [20] This state of matters excited the religious zeal of al Hārith ibn Jabalah, the Arab king of Ghassān, who came to Constantinople in 542-543, and urged Theodora to send two or three bishops to Syria Accordingly two were conse crated by Theodosius, the exiled patriarch of Alexandria, namely, Theodore as bishop of Bostra, with jurisdiction over the provinces of Palestine and Arabia, and Jacob as bishop of Edessa, with juris diction over all Syria and Asia From this time forward Jacob's life was one of ceaseless toil and hardship He visited in person and on foot almost every part of his vast diocese, consecrating deacons and priests, strengthening the weak, and bringing back those who had erred from the true faith But to restore the Monophysite Church bishops were necessary, and the consecration of a bishop required the presence of at least three others Select ing a priest named Conon from Cilicia and another named Eugenius from Isauria, he travelled with them to Constantinople and thence to Alexandria with letters of recommendation from the patriarch Theodosius At Alexandria Conon was ordained bishop of Tarsus in Cilicia and Eugenius bishop of Seleucia in Isauria, whilst Antoninus and Antonius were consecrated for dioceses in Syria On his return to Syria other bishops were appointed to sees there and in Asia, among the latter the historian John of Ephesus , and so the work progressed, till at last Jacob's efforts were crowned by the enthroning of his old friend Sergius as patriarch of Antioch (in 544) Sergius died in 547, and the see remained vacant for three years, after which, by the advice of Theodosius, Jacob and his bishops chose Paul, an abbot of Alexandria, to be their patriarch Of the subsequent internal strifes among the Monophysites them selves we cannot here speak The aged Jacob set out once more in the year 578 to visit Damian, patriarch of Alexandria, but died on the Egyptian frontier in the convent of Mār Romanus or of Casion Here his remains rested in peace till 622, when they were stolen by the emissaries of Zacchæus, bishop of Tellā, and buried with much pomp in the monastery of Pĕsīltā [21] His commemora tion takes place on 28th November, 21st March, and 31st July Jacob's life was too active and busy to admit of his writing much We may mention an anaphora,[22] sundry letters,[23] a creed or confes sion of faith, preserved in Arabic and a secondary Ethiopic trans lation,[24] and a homily for the feast of the annunciation, also extant only in an Arabic translation [25]

Sergius of Rēs'ain Conspicuous among the scholars of this age for his knowledge of Greek, and more especially of the Aristotelian philosophy, was Sergius, priest and archiater of Rēs'ain He was, however, if Zacharias Rhetor may be trusted, a man of loose morals and ava ricious [26] He journeyed in 535 from Rēs'ain to Antioch to lodge a complaint before the patriarch Ephraim against his bishop Asylus [27] Just at this time the exiled Severus of Antioch and Theodosius of Alexandria, as well as the Stylite monk Zĕ'ōrā, were living with Anthimus of Constantinople under the protection of the empress Theodora This alarmed Ephraim, who seems to have found a willing tool in Sergius At any rate he sent him to Rome with letters to Agapetus, who travelled with him to Constantinople in the spring of 536, and procured the deposition and banishment of the Monophysites Sergius died at Constantinople almost imme diately afterwards, and Agapetus followed him in a few days, wherein John of Ephesus and Zacharias Rhetor clearly see the judgment of Heaven [28] As a man of letters Sergius was to the Monophysites what Probus was to the Nestorians he was the first[29] to make them acquainted with the works of Aristotle by means of translations and commentaries 'Abhd īshō', it is true, gives Sergius a place in his catalogue of Nestorian writers,[30] and states that he composed "expositions of logic" or "dialectics", but he merely does so in the same way and on the same grounds that he registers the name of Jacob of Edessa as the author of "annals and a chronicle" [31] The books were too valuable for him to insist on the heresy of the writers In the case of Sergius there was an additional reason The man was well known in the East,[32] many of his works being dedicated to his friend and

of the Museo Borgiano and in Brit Mus Add 14650, from which it has been reedited (with an excellent introduction, translation, and notes) by Guidi, *La Lettera di Simeone*, &c , Reale Accademia dei Lincei, 1881 To this work the reader is referred for all the documents bearing on the subject

1 The name of the father is also given as Cuicus and Cyriacus Assemani's Bursus (*B O* , ii 54) is a misreading

31 *Ibid* , 229

32 He may even be identical with the Sergius mentioned by Agathias as

pupil Theodore, afterwards Nestorian bishop of Marū or Merv (see p 837 *infra*)[1] What remains of Sergius's labours is mostly contained in a single MS of the 7th century (Brit Mus Add 14658)[2] Of translations from the Greek we find in this volume the *Isagoge* of Porphyry, followed by the so called *Tabula Porphyrii*,[3] the *Categories* of Aristotle,[4] the Περὶ κόσμου πρὸς Ἀλέξανδρον,[5] and a treatise on the soul,—not the well known Περὶ ψυχῆς, but a wholly different tractate in five short sections It also contains Sergius's own treatise on logic, addressed to Theodore, which is unfortunately imperfect, a tract on negation and affirmation, a treatise, likewise addressed to Theodore, *On the Causes of the Universe, according to the views of Aristotle, showing how it is a circle*, a tract *On Genus, Species, and Individuality*, and a third tract addressed to Theodore, *On the Action and Influence of the Moon*, explanatory and illustrative of Galen's Περὶ κρισίμων ἡμερῶν, bk iii,[6] with a short appendix "On the Motion of the Sun" Here too we find part (sections 11, 12) of his version of the *Ars Grammatica* of Dionysius Thrax, a larger portion (sections 11 20) being contained in Brit Mus Add 14620 (Wright, *Catal*, p 802)[7] There is a scholion of Sergius on the term σχῆμα in Brit Mus Add 14660 (see Wright, *Catal*, p 1162) In his capacity of physician, Sergius translated part of the works of Galen Brit Mus Add 14661 contains books vi viii of the treatise *De Simplicium Medicamentorum Temperamentis ac Facultatibus* (Wright, *Catal*, p 1187),[8] addressed to Theodore, and in Brit Mus Add 17156 there are three leaves, two of which contain fragments of the *Ars Medica*, and one of the treatise *De Alimentorum Facultatibus* (Wright, *Catal*, p 1188)[9] As one of the clergy, he wasted his time in making a translation of the works which passed under the name of Dionysius the Areopagite[10] Brit Mus Add 12151[11] contains this version with the introduction and notes of Phocas bar Sergius of Edessa,[12] a writer of the 8th century, as appears from his citing Athanasius II and Jacob of Edessa In Brit Mus Add 22370[13] we find Sergius's own introduction and the commentary of a later writer, Theodore bar Zarūdī[14]

Paul of Callinīcus

If Sergius was the Probus of the Monophysites, then Ma'nā was Paul, bishop of Callinicus (ar Rakkah),[15] who, being expelled from his see in 519, betook himself to Edessa and there devoted himself to the task of translating the works of Severus into Syriac We know for certain[16] that he edited versions of the correspondence of Severus and Julian of Halicarnassus on the corruptibility or incorruptibility of the body of Christ, with a discourse of Severus against Julian[17], of the treatise against the *Additions* or *Appendices* of Julian,[18] and against the last apology of Julian[19], of that against the Manichees, and of the *Philalethes*[20] Probably by him are the older translation of the *Homiliae Cathedrales*[21] and that of the correspondence of Sergius Grammaticus and Severus regarding the doctrine of the two natures in Christ,[22] possibly, too, the translation of the treatise against John Grammaticus of Cæsarea[23] and of some other works which are known to us only by a few scattered citations[24] Hence he is called by the Jacobites *Mĕphashshĕkānā dhakhĕthābhē*, "the Translator of Books"[25]

Civil Laws of the Emperors

This seems the proper place to make mention of a most important though anonymous work, the translation of the so called *Civil Laws of the Emperors Constantine, Theodosius, and Leo*, which lies at the root of all subsequent Christian Oriental legislation in ecclesiastical, judicial, and private matters[26] The Syriac version, made from a Greek original, exists in two manuscripts,[27] the older of which undeniably belongs to the earlier part of the 6th century The work itself appears, according to the researches of Bruns (*op cit*, pp 318 319), to date from the time of the emperor Basiliscus (Brit Mus Add 475 477), who was a favourer of the Monophysites, the Syriac translation is ascribed to a Monophysite monk of Mabbōgh or Hierapolis (*ibid*, p 155) The Paris MS probably represents a Nestorian revision of the 9th or 10th century at (Baghdad) Baghdādh (*ibid*, p 166) The oldest MS of the secondary Arabic version is dated 1352 (*ibid*, p 164), but it has been traced back to the time of the Nestorian lawyer Abu 'l Faraj 'Abdallāh ibn at-Taiyib (who died 1043), whether made by him or not (*ibid*, p 177) It belongs to the same class as the London Syriac, but is based on a better text, such as that of the fragment in Brit Mus Add 18295 (*ibid*, p 172)[28] Of the secondary Armenian translation the same is to be said as of the Arabic The oldest MS of it dates from 1328, but it probably goes as far back as the end of the 12th century (*ibid*, p 164) The Georgian version, of which there is a MS at St Petersburg, is most likely an offshoot of the Armenian

Ahū dh'emmēh

Another scholar, besides Sergius, whom 'Abhd ishō' wrongly claims as a Nestorian is Ahū-dh'emmēh, metropolitan of Taghrīth (Tekrit) He appears, on the contrary, to have been the head of the Monophysites in the Persian territory According to Bar Hebraeus,[29] he was appointed by Christopher, catholicus of the Armenians, to be bishop of Bēth 'Arbāyē,[30] but was promoted by Jacob Burdĕ'ānā in 559 to the see of Taghrīth, where he ordained many priests and founded two monasteries Among his numerous converts from heathenism was a youthful member of the royal family of Persia, whom he baptized by the name of George This excited the anger of Khosrau I Anōsharwān, who ordered the bishop to be beheaded (2d August 575) As a writer Ahū dh'emmēh seems to have been more of a philosopher than a theologian[31] He wrote against the Persian priesthood and against the Greek philosophers, a book of definitions, a treatise on logic, on freewill in two discourses, on the soul and on man as the microcosm, and a treatise on the composition of man as consisting of soul and body[32] He is also mentioned by later authors as a writer on grammar[33]

Anonymous historical romances

Somewhat before this time a monk of Edessa, whose name is unknown to us, tried his hand at the composition of a tripartite historical romance,[34]—a history of Constantine and his three sons, an account of Eusebius, bishop of Rome, and his sufferings at the hands of Julian the Apostate, and a history of Jovian or, as the Orientals usually call him, Jovinian, under Julian and during his own reign The whole purports to be written by one Aplōris or Aplōlāris (Apollinarius?), an official at the court of Jovian, at the request of 'Abhdāï, abbot of Sudrūn (?) Māhōzā, with a view to the conversion of the heathens All three parts contain but a very small quantity of historical facts or dates, and deal in the grossest exaggerations and inventions Yet the Syriac style is pure, and we gain from the book a good idea of the way in which the author's countrymen thought and spoke and acted This romance has been published by Hoffmann,[35] and Nöldeke has given a full account of it, with an abridged translation, in *Z D M G*, xxviii p 263 *sq* He places the time of composition between 502 and 532 It is curious to find that this romance must have been known in an Arabic translation to the

residing at the Persian court, where he translated into Greek a history of the kings of Persia, see *B O*, iii 1, 87, note 3, Renan, *De Philosophia Peripatetica apud Syros*, 1852, pp 24 25

1 *B O*, iii 1, 147, Renan, *op cit*, p 29

2 Wright, *Catal*, p 1154 *sq*, comp Renan, *op cit*, p 25 *sq*, *Journ Asiat*, 1852, 4th series, vol xix p 319 *sq*

3 There is a fragment of the *Isagoge* also in Brit Mus Add 1618 (Wright, *Catal*, p 788)

4 In the Vatican MS clviii (*Catal*, iii 305, No vi) this translation is wrongly ascribed to Jacob of Edessa, who could hardly have been more than a boy at the time when the MS in the British Museum was transcribed Besides, the version is not in his style The Paris MS Ancien fonds 161 naturally repeats this mistake (Zotenberg, *Catal*, p 202) In *Catal Bibl Palat Medic*, cod cxcvi, it is likewise erroneously attributed to Honain ibn Ishāk (comp Renan, *De Philos Peripat ap Syros*, p 34, note 3) The Berlin MS Alt Best 36 contains as No 7 a treatise of Sergius on the *Categories* addressed to Philotheus

5 Edited by Lagarde, *Anal Syr*, p 134 *sq*, see V Ryssel, *Ueber den textkritischen Werth d Syr Uebersetzungen griechischer Klassiker*, part i 1880, part ii 1881 In part i p 4 Professor Ryssel speaks of this version as "ein Meisterwerk der Uebersetzungskunst", and in part ii p 10 he says "Die Uebersetzung der Schrift περὶ κόσμου schliesst sich aufs engste an den Text des griechischen Originales an Dass wir deshalb diese Uebersetzung als eine im besten Sinne wortgetreue bezeichnen können, zeigt schon eine Vergleichung mit der lateinischen Bearbeitung des Apulejus von Madaura" This opinion serves to rectify the judgement of Ibn Abī Osaibi'ah (i 204) that Sergius was only a mediocre translator, and that his work needed revision by the later Honain ibn Ishāk

6 See Sachau, *Inedita Syr*, pp 101 126

7 This identification is due to Merx, see *Dionysii Thracis Ars Grammatica*, ed Uhlig, p xliv *sq* Merx has treated of an old, but independent, Armenian version in the same book, p lvii *sq*

8 See Merx's article in *Z D M G*, xxxix (1885), p 237 *sq*

9 See Sachau, *Ined Syr*, pp 88 94

10 See Frothingham, *Stephen bar Sudaili*, p 3

11 See Wright, *Catal*, p 493

12 *B O*, i 468 Assemani erroneously places him before Jacob of Edessa

13 See Wright, *Catal*, p 500

14 There are also old MSS of Sergius's version in the Vatican, *Catal*, iii Nos cvii (p 56), ccliv (p 542) Bar Hebraeus states (*Hist Dynast*, p 158, transl, p 99) that Sergius translated into Syriac the *Syntagma* of the Alexandrian priest and physician Aaron, and added to it two books, but Steinschneider (*Al Fārābī*, p 166, note 2) says that this is a mistake, and that the real author of the two additional books was the Arabic translator Māsarjawaih or Māsarjis The translator of the Geoponica, *Al Falāhah ar Rūmīyah* (Leyden, cod 414 Warn, *Catal*, iii 211) and joint translator of the Μεγάλη σύνταξις of Ptolemy (Leyden, cod 680 Warn, *Catal*, iii 80), by name Serjis or Serjūn (Sergius or Sergōnā) ibn ar Rūmī, seems to be a quite different person of later date

15 *B O*, ii 46 He is to be distinguished from his namesake and contemporary, Paul, bishop of Edessa, who was banished to Euchaita in 522 (*B O*, i 409 411), restored to his see in 526 (*ibid*, p 413), and died in the following year, whereas Paul of Callinicus was working at Edessa in 528 (see p 838 *infra*)

16 Thanks in part to a note at the end of Cod Vat cxl (*Catal*, iii 223, comp *B O*, *loc cit*)

17 Completed in 528, Cod Vat cxl, Brit Mus Add 17200 (Wright, *Catal*, p 554)

35 *Julianos der Abtrünnige*, 1880

historian at Tabarī, who treats it as a genuine historical document.[1] From him it has passed to the *Kāmil* of Ibn al Athīr, i. 283 *sq.*, and the *Akhbār al Bashar* of Abu 'l Fidā (*Hist. Anteislamica*, ed. Fleischer, p. 84). Ibn Wādih al Ya'kūbī seems in his *Annals*[2] to have drawn from the same source, though independently of at Tabarī, and so also al-Mas'ūdī, *Murūj adh Dhahab*, ii. 323. Bar Hebræus has also made some use of it in his *Chronicon*, ed. Bruns and Kirsch, pp. 68 69. No doubt, too, it is the work attributed by 'Abhd-ishō' to the grave ecclesiastical historian Socrates, who, as he says,[3] wrote "a history of the emperors Constantine and Jovinian."

Another, but much inferior, romance, of which Julian is the hero, is contained in Brit. Mus. Add. 7192, a manuscript of the 7th century. It has been edited by Hoffmann, *op. cit.*, pp. 242 259, and translated by Nöldeke, *Z. D. M. G.*, xxviii. 660-674. We shall not be far wrong in assigning it likewise to the 6th century, though it is probably rather later than that just noticed.

Chronicon Edessenum. Of real historical value, on the contrary, is the anonymous *Chronicon Edessenum*, fortunately preserved to us in the Vatican MS. clxiii.,[4] and edited by Assemani in *B. O.*, i. 388-417. There is an English translation of it in the *Journ. of Sacred Lit.*, 1864, vol. v. (new ser.), p. 28 *sq.* It begins with A. Gr. 180, but the entries are very sparse till we reach A. Gr. 513 (202 A.D.). The last of them refers to the year 540, about which time the little book must have been compiled. The author made use of the archives of Edessa and other documents now lost to us, as well as of the *Chronicle* of Joshua the Stylite (see above, p. 832). In religious matters he is not a violent partisan, nor given to the use of harsh words, a thing to be noted in the age in which he lived.

John of Asia or Ephesus. Another writer of first-rate importance as a historian is John, bishop of Asia or Ephesus, "the teacher of the heathen," "the overseer of the heathen," and "the idol breaker," as he loves to style himself.[5] He was a native of Āmid,[6] and must have been born early in the 6th century, according to Land about 505. He was ordained deacon in the convent of St John in 529, when he must have been at least twenty years of age.[7] In 534 the terrible pestilence of the reign of Justinian broke out, and at that time John was in Palestine,[8] having, doubtless, fled from Āmid to avoid the persecution of the Monophysites by Abraham bar Kīlī (?) of Tellā, bishop of Āmid (from about 520 to 546), and Ephraim bar Appian of Āmid, patriarch of Antioch (529-544), "a much worse persecutor than Paul or Euphrasius."[9] In 535 we find him at Constantinople, where in the following year, according to Bar Hebræus,[10] he became bishop of the Monophysites in succession to the deposed Anthimus. Be this as it may, he was certainly received with great favour by Justinian, whose friendship and confidence he enjoyed for thirty years, and "had the administration of the entire revenues of all the congregations of the believers (*i. e.*, the Monophysites) in Constantinople and everywhere else."[11] Wishing to root out heathenism in Asia Minor, obviously for political as well as religious reasons, the emperor appointed John to be his missionary bishop.[12] In this task he had great success, to which his faithful friend and fellow-labourer for thirty-five years, Deuterius, largely contributed.[13] He interested himself, too, in the missionary efforts of Julian, Theodore, and Longinus among the Nubians and Alodæi.[14] In 546 the emperor employed him in searching out and putting down the secret practice of idolatry in Constantinople and its neighbourhood.[15] After the death of his patron the fortunes of John soon underwent a change. Bk. i. of the third part of his *History* commences with the persecution under Justin in 571, in which he suffered imprisonment.[16] His friend Deuterius, whom he had made bishop of Caria, was also persecuted, and died at Constantinople.[17] From this time forward John's story is that of his party, and the evidently confused and disordered state of his *History* is fully explained and excused by his own words in bk. ii. 50, where he tells us[18] "that most of these histories were written at the very time when the persecution was going on, and under the difficulties caused by its pressure; and it was even necessary that friends should remove the leaves on which these chapters were inscribed, and every other particle of writing, and conceal them in various places, where they sometimes remained for two or three years. When therefore matters occurred which the writer wished to record, it was possible that he might have partly spoken of them before, but he had no papers or notes by which to read and know whether they had been described or not. If therefore he did not remember that he had recorded them, at some subsequent time he probably again proceeded to their detail; and therefore occasionally the same subject is recorded in more chapters than one; nor afterwards did he ever find a fitting time for plainly and clearly arranging them in an orderly narrative." Some of the chapters are actually dated at various times from A. Gr. 886 (575 A.D.) to 896 (585). The time and place of his death are unknown, but he cannot have lived long after 585, being then about eighty years of age.[19] His greatest literary work is his *Ecclesiastical History* in three parts, the first two of which, as he himself tells us,[20] embraced, in six books each, the period from Julius Cæsar to the seventh year of Justin II., whilst the third, also in six books, carried on the tale to the end of the author's life. The first part is entirely lost. Of the second we have copious excerpts in the *Chronicle* of Dionysius of Tell-Mahrē[21] and in two MSS. in the British Museum.[22] The third has fortunately come down to us, though with considerable lacunæ, in Brit. Mus. Add. 14640 (of the 7th century).[23] This book is worthy of all praise for the fulness and accuracy of its information and the evident striving of the author after impartiality. The Syriac style, however, is very awkward and involved, and abounds in Greek words and phrases. Of scarcely less value for the history of his own time is another work entitled *Biographies of Eastern Saints*, men and women, contained in Brit. Mus. Add. 14647, ff. 1-135.[24] These lives were gathered into one corpus about 569, as appears from the account of the combination of the monasteries of Āmid during the persecution of 521, which was put on paper in 567,[25] and from the history of the convent of St John, extending from its foundation in 389 to 568.[26] To these lives Land has added three more, which are ascribed in MSS. to John, but do not seem to have been included in this collection.[27]

Zacharias Rhetor. The name of Zacharias Rhetor or Scholasticus, bishop of Mitylēnē in Lesbos,[28] must next be mentioned, for, though a Greek author, his work has entered into the Syriac literature as part of a compilation by a Syrian monk. The *Ecclesiastical History* of Zacharias seems to have terminated about the year 518, whereas his Syriac translator was writing as late as 569,[29] and even later. The MS. in the British Museum, Add. 17202,[30] cannot be younger than the beginning of the 7th century, and is clearly the compilation of a Monophysite, who used Zacharias as his chief authority in books iii.-vi., whereas books i., ii., and vii.-xii. were gathered from different sources, such as Moses of Aggēl (about 550-570), Simeon of Bēth Arshām (see above, p. 832), Mārā of Āmid (see above, p. 833), the correspondence of Julian of Halicarnassus and Severus of Antioch (see above, p. 834), the history of John of Ephesus,[31] &c. In a Syriac MS. in the Vatican (No. cxlv.)[32] we find a series of extracts from this Syriac work (f. 78 *sq.*) as a continuation of copious excerpts from the Greek histories of Socrates and Theodoret. The last of these, on the public buildings, statues, and other decorations of the city of Rome, has been carefully re-edited and annotated by Guidi.[33]

We turn from the historians to the ascetic writers of this century, who seem to have been more prized by their countrymen, though far less valuable to us. And first we mention the author who is commonly called John Sābhā[34] or "the Aged," placing him here on the authority of Assemani (*B. O.*, i. 433), for 'Abhd-ishō' claims him Sābhā as a Nestorian (*B. O.*, iii. 1, 103). His *floruit* is given as about

1 At Tabarī, *Annales*, i. 840 *sq.*, see Nöldeke, in *Z. D. M. G.*, xxviii. 291-292, and *Geschichte der Perser und Araber zur Zeit der Sasaniden*, p. 59 *sq.*
2 Ed. Houtsma, i. 182 183. 3 *B. O.*, iii. 1, 41. 4 See *Catal.*, iii. 329.
5 See *Eccles. Hist.*, ed. Cureton, bk. ii. ch. 4 and bk. iii. ch. 36; Land, *Anecd. Syr.*, ii. 256, l. 25. 6 *B. O.*, ii. 83; Bar Hebræus, *Chron. Eccles.*, i. 195.
7 *B. O.*, ii., *Dissert. de Monophysitis*, p. cxxv.; Land, *Anecd. Syr.*, 174, ll. 8, 9.
8 *B. O.*, ii. 85, 86. 9 *E. H.*, ed. Cureton, bk. i. ch. xli.; comp. *B. O.*, ii. 51.
10 *Chron. Eccles.*, i. 195. 11 *E. H.*, ed. Cureton, bk. v. ch. 1.
12 *Ibid.*, bk. ii. ch. 44, bk. iii. ch. 36, 37; comp. *B. O.*, ii. 85.

14 *Ibid.*, bk. iv. ch. 6 8, 49 53; comp. Bar Hebræus, *Chron. Eccles.*, i. 229. How just his views were as a missionary may be seen from bk. iv. ch. 50, where he says "that it was not right that to an erring and heathen people, who asked to be converted to Christianity and to learn the fear of God, there should be sent by letter, before everything that was necessary for their edification, confusion and offence and the revilings of Christians against Christians."
15 *B. O.*, ii. 85.
16 *E. H.*, ed. Cureton, bk. i. ch. 17, bk. ii. ch. 4 7. Of unjust legal proceedings he complains in bk. ii. ch. 41, where he loses his προάστειον, &c.
17 *E. H.*, ed. Cureton, bk. ii. ch. 44. 18 Payne Smith's translation, p. 163.
19 See Land, *Joannes Bischof von Ephesos, der erste Syrische Kirchenhistoriker*, 1856. A very useful book.
20 *E. H.*, ed. Cureton, bk. i. ch. 3. 21 *B. O.*, ii. 100; comp. pp. 85 90.
22 Add. 14647 (dated 688), ff. 136 139, and 14650 (dated 875), ff. 189 206. Edited by Land, *Anecd. Syr.*, ii. 289 329 and 385 391. See also a small fragment, *ibid.*, 363, from Add. 12154, f. 201b.
23 Edited by Cureton, 1853. There is an English translation by R. Payne Smith, 1860, and a German one by Schönfelder, 1862.
24 Edited by Land, *Anecd. Syr.*, ii. 1 288.
25 *Anecd. Syr.*, ii. 212, l. 17; see also p. 191, last two lines.
26 *Ibid.*, ii. 288, ll. 2, 3.
27 *Ibid.*, ii. 343 362. That of Jacob Burde'ānā (*ibid.*, p. 364) is not his, at least in its present shape (see above, p. 833). There is a slightly different redaction of it in the Bibl. Nation. at Paris, Anc. fonds 144 (Zotenberg, *Catal.*, p. 187).
28 See Land, *Joannes Bischof von Ephesos*, p. 35 *sq.*, and *Anecd. Syr.*, iii., Preface.
29 Land, *Anecd. Syr.*, iii. pp. xi., xii., and p. 5, l. 21 *sq.*
30 See Wright, *Catal.*, p. 1046 *sq.*
31 Not a few chapters in books vii.-x. seem to be derived, in part at any rate, from the second part of the *Ecclesiastical History*.
32 *Catal.*, iii. 253; *B. O.*, ii. 54 *sq.*; Mai, *Scriptorum Veterum Nova Collectio*, x. pp. xi.-xiv., 332 388. The MS., which Assemani calls "pervetustus, Syriacis literis strongylis exaratus" (p. 253), is not likely to be earlier than the middle of the 8th century, as it contains a work of the patriarch Elias, who sat from 708 to 728.
33 *Il Testo Siriaco della Descrizione di Roma*, &c., from the *Bullettino della Commissione Archeologica di Roma*, fasc. iv. anno 1884 (Rome, 1885). It is also extant in a shorter form in Brit. Mus. Add. 12154, f. 158a (see Wright, *Catal.*, p. 984; Guidi, p. 235 *sq.*).
34 There is some uncertainty about his name. In *B. O.*, i. 434, Assemani gives ܝܘܚܢܢ ܗܘ ܕܕܝܠܬܐ, John of Dīlāitā, which, he says (p. 433), is a convent at Nineveh, on the opposite bank of the Tigris from Mosul. In vol. iii. 1, 103 he prints ܝܘܚܢܢ ܗܘ ܕܕܝܠܬܗ, which he renders Joannes

550 His writings consist of short sermons or tracts, exclusively intended for the training and study of monks and cœnobites, and a number of letters 'Abhd-ishō' (*loc cit*) says "he composed two volumes, besides mournful epistles, on the monastic life" They were collected[1] by his brother, who has prefixed a brief apology, at the end of which the reader may find a curious example of affected humility (*B O*, i 435)[2] Two short specimens of the style of "the spiritual old man," *ash Shaikh ar rūhānī*, are printed in Zingerle's *Monumenta Syr*, i 102 104

Isaac of Nineveh A little junior to John Sābhā was the even more widely known Isaac of Nineveh,[3] to whom the Nestorians also lay claim[4] His date is fixed, as Assemani points out, by the facts of his citing Jacob of Sĕrūgh and corresponding with Simeon Stylites the younger or Thaumastorites, who died in 593 According to the Arabic biography, printed in *B O*, i 444, he was a monk of the convent of Mār Matthew at Mosul, and afterwards became bishop of that city, but soon resigned his office and retired to the desert of Skētē in Egypt, where he composed his ascetic works According to 'Abhd-ishō' (*B O*, iii 1, 104), Isaac "wrote seven volumes on the guidance of the Spirit, and on the Divine mysteries and judgements and dispensation" Many of his discourses and epistles have been catalogued by Assemani, *B O*, i 446 460 The MS Vat cxxiv contains the first half of his writings (*Catal*, iii 143), and similarly MSS Brit Mus Add 14632 and 14633[5] The Arabic translation is divided into four books, the Ethiopic is naturally derived from the Arabic A Greek version was made from the original Syriac by two monks of St Saba, near Jerusalem, named Patricius and Abraamius, on which see Assemani, *B O*, i 445, and Bickell, *Conspectus*, p 26 The only printed specimens of his discourses are two in Zingerle's *Monumenta Syr*, i 97-101

Abraham of Nephtar Another author of this class, but of less mark, is Abraham of Nephtar,[6] who flourished towards the end of the 6th century and in the early part of the 7th[7] Him too the Nestorians claim as theirs[8] 'Abhd-ishō' speaks of "various works" of his,[9] but our libraries seem to contain only eight short discourses, the titles of which are given by Assemani, *B O*, i 464[10] They have been translated into Arabic, and there was also a Persian version of them by Job the monk (*B O*, iii 1, 431)

Moses of Aggēl We record here the name of Moses of Aggēl as being one of those who, after Rabbūlā, undertook the translation of the writings of Cyril of Alexandria into Syriac He made a version of the *Glaphyra*, at the request of a monk named Paphnutius, from whose letter[11] we learn that the treatise *On Worship in Spirit and in Truth* had been already translated,[12] whilst from the reply of Moses, as quoted in *B O*, ii 82 83, it is obvious that he was writing after the death of Philoxenus and the chorepiscopus Polycarp Hence we may place him soon after the middle of the century, say from 550 to 570 Much later he cannot be, because his translation of the History of Moses and Āsyath (see above, p 826) has been admitted into the Syriac compilation that passes under the name of Zacharias Rhetor (see above, p 835)[13]

Peter of Callinicus Peter of Callinicus (ar Rakkah), Jacobite patriarch of Antioch, 578 591,[14] deserves mention on account of his huge controversial treatise against Damian, patriarch of Alexandria, manuscripts of parts of which, of the 7th and 8th centuries, are extant in the Vatican and the British Museum[15] Other writings of his are an anaphora,[16] a short treatise against the Tritheists,[17] sundry letters,[18] and a metrical homily on the Crucifixion of our Lord[19] In the dispute between him and Damian was involved his syncellus and successor Julian, who defended Peter against an attack made upon him by Sergius the Armenian, bishop of Edessa, and his brother John[20]

Of the numerous Nestorian writers of the 6th century we unfortunately know but little more than can be learned from the catalogue of 'Abhd-ishō' Their works have either been lost, or else very few of them have as yet reached our European libraries

Abraham of Nisibis The successor of Narsai (above, p 830) in the school of Nisibis was his sister's son Abraham,[21] who must have fled from Edessa with his uncle[22] His principal writings are commentaries on Joshua, Judges, Kings, Ecclesiasticus, Isaiah, the twelve minor prophets, Daniel, and the Song of Songs[23]

John of Nisibis To him succeeded as teacher John, also a disciple of Narsai[24] He wrote commentaries on Exodus, Leviticus, and Numbers, Job, Jeremiah, Ezekiel, and Proverbs, also controversial treatises against the Magi or Persian priesthood, the Jews, and (Christian) heretics, a book of questions on the Old and New Testaments, and various hymns It the discourses on the plague at Nisibis[25] and the death of Khosrau I Anōsharwān be really by him, he was alive as late as 579, in the spring of which year that monarch died[26]

John was followed by Joseph Hūzāyā,[27] another disciple of Narsai,[28] Joseph and the first Syriac grammarian Of him Bar Hebræus observes[29] Hūzāyā that "he changed the Edessene (or Western) mode of reading into the Eastern mode which the Nestorians employ, otherwise during the whole time of Narsai they used to read like us Westerns" He was the inventor of some of the Syriac signs of interpunction,[30] and wrote a treatise on grammar[31] and another on words that are spelled with the same letters but have different meanings[32]

Mār-abhā I Of Mār abhā[33] the Elder, catholicus from 536 to 552, we have already spoken above as a translator of the Scriptures (p 826) He was a convert from the Zoroastrian religion, and seems to have been a man of great talent and versatility, as he mastered both the Greek and Syriac languages Receiving baptism at Hērtā (al-Hīrah) from a teacher named Joseph, he went for the purposes of study to Nisibis, and afterwards to Edessa, where he and his teacher Thomas[34] translated into Syriac the liturgy of Nestorius[35] They visited Constantinople together, and, escaping thence at some risk of their lives, he took themselves to Nisibis, where Mār abhā became eminent as a teacher On being chosen catholicus he opened a college at Seleucia and lectured there Unluckily, he got into controversy, it is said, with the Persian monarch Khosrau I Anōsharwān (531-579), who banished him to Ādharbāigān (Azerbijan) and destroyed the Nestorian church beside his palace at Seleucia Mār abhā, however, had the temerity to return to Seleucia, was thrown by the king into prison, and died there[36] His dead body was carried by one of his disciples to Hērtā, where it was buried and a monastery erected over the grave He wrote[37] commentaries on Genesis, the Psalms, and Proverbs, and the epistles of St Paul to the Romans, Corinthians, Galatians, Ephesians, Philippians, and Hebrews, various homilies, synodical epistles[38], and ecclesiastical canons[39] In these last he opposed the practice of marriage at least among the higher orders of the clergy, the bishops and catholics What is meant by his "canones in totum Davidem" may be seen from such MSS of the

Daliathensis, *i e*, from ad Dāliyah, الدالية, probably meaning Dāliyat Mālik ibn Tauk, on the right bank of the Euphrates below ar Rakkah and Rahbat Mālik ibn Tauk In the Vatican *Catalogue* he calls him Daliathensis, writing, however, in Syriac ܕܕܠܝܬܐ But how can ܕܕܠܝܬܗ mean "of ad Dāliyah" (ܕܕܠܝܐ)? Following the analogy of ܡܪܝ ܕܒܩܘܒܐ, ܕܡܪܝ ܕܩܘܒܐ, and the like, it ought rather to mean "John of the Vine Branches," or "John with the Varicose Veins," or (as in Arabic) "John of the Buckets"

[1] See Wright, *Catal*, p 863, ? In the *B O*, i 431, Assemani gives an Arabic version of it from a Vatican MS

[2] For a list of them in Syriac and Arabic, see *B O*, i 435 444, and comp Wright, *Catal*, pp 582, 584, 860, 870 (No 16) There is also an Ethiopic version, *Baqāwī Manfasāwī*, made from the Arabic, see Zotenberg, *Catal des MSS Éthiopiens de la Bibl Nation*, No 115, p 134

[3] *B O*, i 444

[4] *Ibid*, iii 1, 104

[5] Wright, *Catal*, pp 569, 576

[6] Also written Nethpar and Nephrath, see Assemani, *Catal Vat*, iii 138 But as we can find no trace of any such town as Nephtar, the name of ܢܦܬܪ may have some other origin

[7] *B O*, iii 1, 191, note 1

[8] Compare Wright, *Catal*, p 187, No 154

[9] *B O*, iii 1, 191

[10] There seem to be ten in Cod Vat cccxxix, see Mai, *Scriptt Vett Nova Coll*, v 65

[11] Cod Vat cvii (*Catal*, iii 58), Guidi, *Rendiconti della R Accademia dei Lincei*, May and June, 1886, p 399 *sq*

[12] Brit Mus Add 12166, ff 155 258, bears date 553 (Wright, *Catal*, p 491)

[13] Of the Vatican MS of the *Glaphyra* only five leaves remain (*Catal*, iii 54), and the MS in the British Museum, Add 14555, is very imperfect (Wright, *Catal*, p 483) As Guidi has shown, these two MSS are merely the *disjecta membra* of one codex

[14] *B O*, i 69, 332, Bar Hebræus, *Chron Eccles*, i 250

[15] *B O*, ii 77 82, comp Bar-Hebræus, *Chron Eccles*, i 257

[16] *B O*, ii 77

[17] Brit Mus Add 12155, f 231b (Wright, *Catal*, p 951)

[18] Wright, *Catal*, p 1314

Psalter as Brit. Mus. Add. 7156[1] and Munich, cod. Syr. 4 (Orient. 147).[2] Hymns of his are also extant.[3]

Abraham of Kashkar.

Under Mār abhā flourished Abraham of Kashkar (al-Wāsit), distinguished for his acquaintance with philosophy and for his ascetic virtues. He introduced certain reforms into the Persian monasteries. After living for some time in a cave at Hazzah,[4] he betook himself to Jerusalem and thence to Egypt. Returning to his old haunt, he led the life of a hermit for thirty years, travelling into the far north as a missionary. He died at Hazzah, but his body was secretly removed to his native place Kashkar. He wrote a treatise on the monastic life, which was translated into Persian by his disciple Job the monk.[5]

He must, it would seem, be distinguished from another Abraham of Kashkar, who lived about the same time, and with whom Assemani has confounded him.[6] This Abraham was a student at Nisibis under Abraham the nephew of Narsai. Thence he went to Hērtā (al Hīrah), where he converted some of the heathen inhabitants, visited Egypt and Mount Sinai, and finally settled down as a hermit in a cave on Mount Īzlā, near Nisibis, where a great number of followers soon gathered about him and a large monastery was built. He introduced stricter rules than heretofore among the cœnobites.[7] His death did not take place till towards the end of the century.[8]

Theodore of Merv.

Theodore, bishop of Marū or Merv, was appointed to this see by Mār abhā in place of David, whom he had deposed, about 540. He seems to have been much addicted to the study of the Aristotelian dialectics, since several of the translations and treatises of Sergius of Rās'ain are dedicated to him.[9] Among his own works[10] there is mentioned "a solution of the ten questions of Sergius." He also composed a commentary on the Psalms and a metrical history of Mār Eugenius and his companions,[11] who came from Klysma and introduced asceticism into Mesopotamia about the beginning of the 4th century. What may have been the contents of the "liber variargumenti" which he wrote at the request of Mār abhā himself it is hard to guess, in the default of any copy of it.

Gabriel of Hormizdshīr.

Theodore's brother Gabriel, bishop of Hormizdshīr,[12] is stated by 'Abhd īshō'[13] to have written two controversial books against the Manichees and the Chaldæans (astrologers), as also about 300 chapters on various passages of Scripture which needed elucidation and explanation.

Joseph of Seleucia.

The successor of Mār abhā in the see of Seleucia was Joseph, in 552. He studied medicine in the West and practised in Nisibis, where he lived in one of the convents. Having been introduced by a Persian noble to the notice of Khosrau I, he cured that monarch of an illness, and ingratiated himself with him so much that he favoured his appointment to the office of catholicus. Of his strange pranks and cruelties as archbishop some account, doubtless highly coloured, may be read in *B. O.*, iii. 1, 432-433, and Bar Hebræus, *Chron. Eccles.*, ii. 95-97. He was deposed after he had sat for three years, but he lived twelve years longer, during which time no successor was appointed. He promulgated twenty-three canons,[14] and, according to Elias, bishop of Damascus (893),[15] after his deposition drew up a list of his predecessors in the dignity of catholicus, wherein he would seem to have paid special attention to those who had shared the same fate with himself. At least Bar Hebræus[16] (perhaps not a quite trustworthy witness in this case) gives currency to the charge of his having forged the consolatory epistles of Jacob of Nisibis and Mār Ephraim to Pāpā of Seleucia on his deposition.

Paul the Persian.

A little later in the century, under the sway of his successor Ezekiel (a disciple of Mār abhā and the son-in-law of his predecessor Paul), 567-580,[17] there flourished Paul the Persian,[18] of Dērshahr or Dērshahr,[19] a courtier of Khosrau I Anōsharwān.[20] He is said by Bar Hebræus[21] to have been distinguished alike in ecclesiastical and philosophical lore, and to have aspired to the post of metropolitan bishop of Persis, but, being disappointed, to have gone over to the Zoroastrian religion. This may or may not be true; but it is certain that Paul thought more of knowledge than faith, for thus he speaks:[22] "Scientia enim agit de rebus proximis et manifestis et quæ sciri possunt, fides autem de omnibus materiis quæ remotæ sunt, neque conspiciuntur neque certa ratione cognoscuntur. Hæc quidem eum dubio est, illa autem sine dubio. Omne dubium dissensionem parit, dubii absentia autem unanimitatem. Scientia igitur potior est fide, et illam præ hac eligendum est." Bar Hebræus speaks of Paul's "admirable introduction to the dialectics (of Aristotle),"[23] by which he no doubt means the treatise on logic extant in a single MS. in the Brit. Mus.[24] It has been edited, with a Latin translation and notes, by Land.[25]

Bōdh.

About this same time Assemani[26] places the periodeutes Bōdh, who is said to have had the charge of the Christians in the remoter districts of the Persian empire as far as India. Among his writings are specified "discourses on the faith and against the Manichees and Marcionites," as well as a book of "Greek questions," probably philosophical, bearing the strange title of *Aleph Mīgīn*.[27] All these have perished, but his name will go down to remote posterity as the translator into Syriac of the collection of Indian tales commonly called *Kalīlah and Dimnah*.[28] Of this work a single copy has come down to our time, preserved in an Oriental library. A transcript of it was first procured by Bickell,[29] who, in conjunction with Benfey, edited the book (Leipsic, 1876); and since then three additional copies of the same original have been got by Sachau.[30] That Bōdh made his Syriac translation from an Indian (Sanskrit) original, as 'Abhd īshō' asserts, is wholly unlikely; he no doubt had before him a Pahlavī or Persian version.[31]

Hannānā of Hĕdhaiyabh.

Just at this period the Nestorian Church ran a great risk of disruption from an internal schism. Hannānā of Hĕdhaiyabh, the successor of Joseph Hūzāyā in the school of Nisibis, who had, it is said, a following of 800 pupils,[32] had dared to assail the doctrines and exegesis of Theodore of Mopsuestia and to follow in some points those of Chrysostom.[33] He commenced his work at Nisibis, under the metropolitan Ahā dh'abhū(hi),[34] by publishing a revised edition of the statutes of the school.[35] During the time of the catholicus Ezekiel (567-580)[36] he brought forward his theological views, which were condemned at a synod held under the next catholicus, Īshō' yabh of Arzōn (581-595),[37] and at another synod presided over by his successor, Sabhr-īshō' (596-604).[38] On the death of this latter a struggle took place between the rival factions, the orthodox Nestorians putting forward as their candidate Gregory of Tell-Besmē,[39] bishop of Nisibis, whilst the others supported Gregory of Kashkar, a teacher in the school of Māhōzē or Sēlīk (Seleucia).[40] The influence of the Persian court decided the matter in favour of the latter, who was a *persona grata* in the eyes of the queen Shīrīn and her physician Gabriel of Shiggār (Sinjār),[41] a keen Monophysite, who naturally availed himself of this opportunity to harm the rival sect of Christians. Gregory was not, however, a partisan of Hannānā, but an orthodox Nestorian, as appears from the account given of the synod over which he presided,[42] by which the Nicene creed was confirmed, the commentaries of Theodore of Mopsuestia approved, and the memory and writings of Bar-saumā vindicated against his assailants. He died at the end of three years (607), and the archiepiscopal see remained vacant till after the murder of Khosrau II Parwēz in 628, during which time of persecution Bābhai the archimandrite distinguished himself as the leader and guide of the Nestorian Church. In the overthrow of Khosrau the oppressed Nestorians bore a part, more especially Shamtā[43] and Kurta, the sons of the noble Yazdīn, who had been the director of the land-tax of the whole kingdom and had amassed an enormous fortune, which the king confiscated.[44] To return to Hannānā, his works, as enumerated by 'Abhd īshō',[45] are—commentaries on Genesis, Job, Psalms, Proverbs, Ecclesiastes, the Song of Songs, the twelve minor prophets, the Gospel of St Mark, and the epistles of St Paul; expositions of the (Nicene) creed and the liturgy; on the occasions of the celebration of Palm

Sunday, Golden Friday,[1] rogations,[2] and the invention of the cross, a discourse on Palm Sunday, and various other writings in which he attacked the teaching of Theodore of Mopsuestia, and which the church therefore placed on its *index expurgatorius* [3]

Joseph of Hazzā — The doctrines of Hannānā found a warm champion in Joseph of Hazzā (Arbēl or Irbil),[4] with whom Bābhai the archimandrite entered into controversy [5] He is said to have composed some 1900 tracts, of which 'Abhd īshō' mentions about a dozen as "profitable," whence we may conjecture that the rest were more or less deeply tinged with heresy The chief of them are—on theory (or speculation) and practice, the book of the treasurer, containing the solution of abstruse questions, on misfortunes and chastisements, on the reasons of the principal feasts of the church, the book of the histories of the Paradise of the Orientals, containing many notices of ecclesiastical history, an exposition of the vision of Ezekiel and of the vision of St Gregory, of the book of the merchant[6], of (pseudo)Dionysius (the Areopagite), and of the *capita scientiæ* or heads of knowledge (of Evagrius), besides epistles on the exalted character of the monastic life Joseph appears to have been made a bishop in his latter days, and to have taken the name of 'Abhd īshō', at least a MS in the India Office (No 9) contains a tract on Zech iv 10 (f 241b), and three series of questions addressed by a pupil to his teacher, by "Mār 'Abhd īshō', who is Joseph Hazzāyā" (f 293a) [7]

Īshō' yabh I of Arzōn — The successor of Ezekiel as catholicus of the Nestorians was Īshō' yabh of Arzōn, 581 595 [8] He was a native of Bēth 'Arbāyē, educated at Nisibis under Abraham (see above, p 836), and subsequently made bishop of Arzōn ('Αρζανηνή) He managed to ingratiate himself with the Persian monarch Hormizd IV (579 590), by whose influence he was raised to the archiepiscopate, and he continued to stand in favour with his son and successor Khosrau II Parwēz, as well as with the Greek emperor Maurice Doubtless both found the Christian archbishop a convenient ambassador and agent in public and private affairs, for Maurice had given his daughter Maria in marriage to Khosrau [9] He was also a friend of the Arab king of Hērtā (al Hīrah), Abū Kābūs Nu'mān ibn al Mundhir, who had been converted to Christianity, with his sons, by Simeon, bishop of Hērtā, Sabhr īshō', bishop of Lāshōm, and the monk Īshō' zēkhā [10] On a pastoral visit to this part of his diocese, the catholicus was taken ill, and died in the convent of Hind (the daughter of Nu'mān) at al Hīrah Among his works are mentioned[11] a treatise against Eunomius, one against a heretical (Monophysite) bishop who had entered into argument with him, twenty two questions regarding the sacraments of the church,[12] an apology,[13] and synodical canons and epistles

Mēshīhā zēkhā — Mēshīhā zēkhā, also called Īshō' zēkhā or Zēkhā īshō', was a monk of Mount Izlā [14] When many of his brotherhood were expelled from their convent by Bābhai the archimandrite,[15] he betook himself to the district of Dāsen,[16] and founded there a monastery, which was henceforth known as Bēth Rabban Zēkhā īshō' or, for shortness' sake, Bēth Rabban simply [17] He was the author of an ecclesiastical history, which 'Abhd īshō' praises as being "exact"

Dādh īshō' — Dādh īshō' was the successor of Abraham of Kashkar as abbot of the great convent on Mount Izlā,[18] apparently during the life time of the latter, who lived to a great age (see above p 837) [19] He composed a treatise on the monastic life and another entitled *On Silence in Body and in Spirit*, a discourse on the consecration of the cell, besides funeral sermons and epistles He also translated or edited a commentary on *The Paradise of the Western Monks* (probably meaning the *Paradise* of Palladius and Jerome), and annotated the works of Isaiah of Scete [20]

Bar 'idtā — Hereabout too is the date of the monk Bar-'idtā,[21] the founder of the convent which bears his name,[22] a contemporary of Bābhai of Izlā and Jacob of Bēth 'Ābhē [23] He was the author of a monastic history, which is often quoted by Thomas of Margā,[24] and seems to have been a work of considerable value He must be distinguished from a later Bar 'idtā, of the convent of Sēlībhā, near the village of Heghlā on the Tigris,[25] with whom Assemani has confounded him [26]

Simeon Barkāyā — In the *Bibl Orient*, iii 1, 230, 'Abhd-īshō' mentions an historian Simeon whose name is given by Assemani as Simeon Karkhāyā, with the additional information that he was bishop of Karkhā and flourished under the patriarch Timothy I about 800 His name seems, however, to have been wrongly read, and he appears to have lived at a much earlier date At least Elias bar Shīnāyā speaks in his *Chronicle*[27] of one Simeon Barkāyā[28] as the author of a chronicle (in at least two books), who wrote in the reign of the Persian king Khosrau II Parwēz, A Gr 902=591 A D

Sabhr-īshō' — The name of Sabhr īshō' the catholicus carries us over into the 7th century He was a native of Pērōz ābādh in Bēth Garmai, became bishop of Lāshōm, and was raised to the archiepiscopate in 596 by the favour of Khosrau II Parwēz [29] On the murder of his father in law Maurice (November 602), Khosrau resolved upon war, and took the field in 604, when he besieged and captured the fortress of Dārā, the first great success in a fearful struggle of twenty-five years Bar Hebræus states that Sabhr īshō' accompanied him and died during the siege [30], but other authorities say, doubtless more correctly, that he died at Nisibis [31] He is said to have been the author of an ecclesiastical history, of which a fragment, relating to the emperor Maurice, was supposed to be extant in Cod Vat clxxxiii, but Guidi has shown that this is incorrect, and that the said fragment is merely an extract from a legendary life of Sabhr īshō' by some later hand (*Z D M G*, xl, pp 559 561) [32]

Simeon of Bēth Garmai — About the same time with Sabhr īshō', if Assemani be right,[33] we may place Simeon of Bēth Garmai, who translated into Syriac the *Chronicle* of Eusebius This version seems unfortunately to be entirely lost

Period of Graeco Persian war — With the 7th century begins the slow decay of the native literature of the Syrians, to which the frightful sufferings of the people during the great war with the Persians in its first quarter largely contributed [34] During all those years we meet with scarcely a name of any note in letters, more especially in western Syria Paul of Tellā and Thomas of Harkel were, it is true, labouring at the revised versions of the Old and New Testaments in Alexandria,[35] but even there they were scared by the Persian hosts, who took possession of the city in 615 or 616, shortly after the capture of Jerusalem by another army in 614 [36] A third diligent worker under the same adverse circumstances was the abbot Paul, who fled from his convent in Syria to escape the Persian invasion, and took refuge in the island of Cyprus

Abbot Paul — Here he occupied himself with rendering into Syriac the works of Gregory Nazianzen [37] Of this version, which was completed in two volumes in 624, there are several old MSS in the British Museum [38] This Paul was also the translator of the *Octoëchus* of Severus, of which there is a MS in the British Museum, Add 17134, dated 675 [39] To this collection he himself contributed a hymn on the holy chrism and a translation of the "Gloria in excelsis"

Mārūthā — The name of Mārūthā [40] is the first that deserves mention here, more, however, on account of his ecclesiastical weight and position than his literary merit He was a native of Shurzak (?), a village in the diocese of Bēth Nuhādhrē,[41] was ordained priest in the convent of Naidus, lived for twenty years in the convent of Zakkāi or Zacchæus at Callinicus (ar Rakkah), and went thence to Edessa for purposes of study On returning to the East, he resided in the convent of Mār Matthew at Mosul, where he occupied himself with remodelling its rules and orders He sided with the Monophysite party at the Persian court, and, after the death of the physician Gabriel,[42] found it advisable to retire to 'Ākōlā (al Kūfah) [43] He was elevated to the dignity of metropolitan bishop of Taghrīth in 640, after the establishment of peace between the Greeks and

Persians,[1] and was the first real maphriān (maphrĕyānā) and organizer of the Jacobite Church in the East, which so rapidly increased in numbers and influence that he was called upon to ordain bishops for such remote regions as Segestān (Sīstān) and Harēw (Herāt). Mārūthā died in 649. His life was written by his successor Denḥā.[2] Mārūthā compiled a liturgy and wrote a commentary on the Gospels, both of which are sometimes wrongly assigned to the elder Mārūthā of Maiperkaṭ.[3] He was also the author of short discourses on New (or Low) Sunday, and on the consecration of the water on the eve of the Epiphany, as well as of some hymns and sedrās.[4]

Severus Sēbōkht. Contemporary with Mārūthā, under the patriarch Athanasius Gammālā (died in 631[5]) and his successor John, flourished Severus Sēbōkht[6] of Nisibis,[7] bishop of the convent of Ḳen-neshrē, at this time one of the chief seats of Greek learning in western Syria.[8] He devoted himself, as might be expected, to philosophical and mathematical as well as theological studies.[9] Of the first we have specimens in his treatise on the syllogisms in the *Analytica Priora* of Aristotle, his commentary on the Περὶ ἑρμηνείας, and his letters to the priest Aitīlāhā of Mosul on certain terms in the Περὶ ἑρμηνείας, and to the periodeutes Yaunān or Jonas on some points in the logic of Aristotle.[10] Of his astronomical and geographical studies there are a few examples in Brit. Mus. Add. 14538, ff. 153-155,[11] such as whether the heaven surrounds the earth in the form of a wheel or sphere, on the habitable and uninhabitable portions of the earth, on the measurement of the heaven and the earth and the space between them, and on the motions of the sun and moon.[12] In the Royal Library at Berlin there is a short treatise of his on the astrolabe.[13] More or less theological in their nature are his letter to the priest and periodeutes Basil of Cyprus, on the 14th of Nīsān, A. Gr. 976 (665 A.D.),[14] a treatise on the weeks of Daniel,[15] and letters to Sergius, abbot of Skiggār (Sinjār), on two discourses of Gregory Nazianzen.[16] He is also said to have drawn up a liturgy.[17]

John I. John I., Jacobite patriarch of Antioch, was called from the convent of Eusēbhōnā at Tell 'Addā to the archiepiscopal throne in 631, and died in December 648.[18] Bar-Hebræus tells us that he translated the Gospels into Arabic at the command of the Arab emīr 'Amr ibn Sa'd. He is better known as the author of numerous sedrās and other prayers, whence he is commonly called Yōhannān dĕ-sedhrau(hī), or "John of the Sedrās." He also drew up a liturgy.[19]

Muhammadan conquest of Syria. During the second quarter of this century, from 633 to 636, the Muhammadan conquest of Syria took place. The petty Arab kingdoms of the Lakhmites (al-Ḥīrah), the Tha'labites and Kindites, and the Ghassānites, as well as the wandering tribes of Mesopotamia, were absorbed, and the Persians were beaten back into their own country, quickly to be overrun in its turn. The year 638 witnessed the last effort of the Greek empire to wrest Syria from the invaders; the Muslim yoke was no longer to be shaken off. The effects of this conquest soon begin to make themselves manifest in the literature of the country. The more the Arabic language comes into use, the more the Syriac wanes and wastes away; the more Muhammadan literature flourishes, the more purely Christian literature pines and dwindles; so that from this time on it becomes necessary to compile grammars and dictionaries of the old Syriac tongue, and to note and record the correct reading and pronunciation of words in the Scriptures and other books, in order that the understanding of them may not be lost.

Jacob of Edessa. Among the small band of Monophysite scholars who made themselves conspicuous during the latter half of the 7th century the most famous name is that of Jacob of Edessa.[20] He was a native of 'Ēn-dĕbhā (the Wolf's well), a village in the district of Gumyah (al-Jūmah), in the province of Antioch. The date of his birth is not mentioned, but it may have been about 640 or a little earlier.[21] He studied under Severus Sēbōkht at the famous convent of Ḳen-neshrē, where he learned Greek and the accurate reading of the Scriptures. Thence he went to Alexandria, but we are not told how long he remained there. After his return to Syria he was appointed bishop of Edessa in 679-680,[22] but Bar-Hebræus says that he was ordained by the patriarch Athanasius II., 684-687, which seems more probable, as they were intimate friends. If he was appointed in 684, the three or four years for which he held this office would terminate in 687-688, in which latter year Julian Rōmāyā (or "the Soldier")[23] was elected patriarch. Apparently Jacob was very strict in the enforcement of canonical rules, and thereby offended a portion of his clergy. He would seem to have appealed to the patriarch and his fellow-bishops, who were in favour of temporizing; whereupon Jacob burnt a copy of the rules before the gate of Julian's convent, at the same time crying aloud, "I burn with fire as superfluous and useless the canons which ye trample under foot and heed not." He then betook himself to the convent at Kaisūm, a town near Samosāta, and Habbībh was appointed to Edessa in his stead. After a while the monks of Eusēbhōnā invited Jacob to their convent, and there he taught for eleven years the Psalms and the reading of the Scriptures in Greek, the study of which language had fallen into desuetude. Owing to disputes with some of the brethren "who hated the Greeks," he left this house and went to the great convent at Tell-'Addā, where he worked for nine years more at his revised version of the Old Testament.[24] On the death of Habbībh Jacob was recalled to Edessa, where he resided for four months, at the end of which time he returned to Tell 'Addā to fetch his library and pupils, but died there on 5th June 708.[25] In the literature of his country Jacob holds much the same place as Jerome among the Latin fathers. He was, for his time, a man of great culture and wide reading, being familiar with Greek and with older Syriac writers. Of Hebrew he probably understood very little, but he was always ready, like Aphraates, to avail himself of the aid of Jewish scholars, whose opinion he often cites. He appears before us as at once theologian, historian, philosopher, and grammarian, as a translator of various Greek works, and as the indefatigable correspondent of many students who sought his advice and assistance from far and near. As a theologian, Jacob wrote commentaries on the Old and New Testaments, which are cited by later authors, such as Dionysius bar Salībī[26] and Bar Hebræus, as well as in the large *Catena* of the monk Severus,[27] further, scholia on the whole Scriptures, of which specimens may be found in *S. Ephraemi Opera Syr.*[28] and in Phillips's *Scholia on some Passages of the Old Testament* (1864).[29] His discourses on the six days of creation are extant at Leyden and Lyons.[30] This was his latest work, being unfinished at the time of his death; it was completed by his friend George, bishop of the Arab tribes. Like many other doctors of the Syrian Church, Jacob drew up an anaphora or liturgy,[31] and revised the liturgy of St James, the brother of our Lord.[32] He also composed orders of baptism,[33] of the consecration of the water on the eve of the Epiphany,[34] and of the solemnization of matrimony,[35] with which we may connect his translation of the order of baptism of Severus[36] and the tract upon the forbidden degrees of affinity.[37] The *Book of Treasures*[38] contained expositions of the Eucharistic service, of the consecration of the water, and of the rite of baptism, probably identical with or similar to those which are found separately in MSS.[39] He likewise arranged the horologium or canonical hours of the ferial days,[40] and drew up a calendar of feasts and saints' days for the whole year.[41] Of his numerous canons,[42] those addressed to the priest Addai have been edited by Lamy, *Dissert. de Syrorum Fide*, &c., p. 98 *sq.*, and De Lagarde, *Reliquiæ Juris Eccles. Antiquissimæ*, p. 117 *sq.*[43]

1 The circumstances are given in detail by Bar Hebræus (*Chron. Eccles.*, ii. 119 *sq.*) and Assemani (*B. O.*, ii. 419).

Under this head we may mention the *Scholion de Diaconissis earumque Munere* (*Catal Vat*, ii 319) and the *Scholion de Foribus Ecclesiæ dum Ordinationes aut alia Sacra celebrantur occludendis* (Cod Vat ccciv, in Mai, *Script Vett Nova Coll*, v) Jacob also composed homilies, of which a few survive in manuscript for example—(1) that Christians are not to offer a lamb after the Jewish fashion, nor oxen and sheep, on behalf of the deceased, nor to use pure wine and unleavened bread in celebrating the Eucharist, (2) against the use of unleavened bread, (3) against the Armenians as Dyophysites, and because they offend against these doctrines[1], (4) against certain impious men and transgressors of the law of God, who trample under foot the canons of the church[2] To these may be added his metrical discourses on the Trinity and the incarnation of the word[3] and on the faith against the Nestorians[4] Whether the treatise *De Causa omnium Causarum*[5] really belongs to him can hardly be decided till it has been published The remarks in the *Bodleian Catalogue*, p 585, note, point to a writer of much later date The loss of Jacob's *Chronicle* is greatly to be regretted, only a few leaves, all more or less mutilated, remain to us in Brit Mus Add 14685[6] The author's design was to continue the *Chronicle* of Eusebius on the same plan, from the twentieth year of the reign of Constantine down to his own time The introduction was divided into four sections, the first of which treated of the canon of Eusebius and the error of three years in his calculation, the second of the dynasties contemporary with the Roman empire, but omitted by Eusebius, the third explained what dynasties were coordinated by Jacob with the Roman empire, and the fourth contained separate chronologies of each of these dynasties Then followed the chronological canon, beginning with Olympiad cclxxvi The last monarchs mentioned in the mutilated MS are Heraclius I of Constantinople, Ardashēr III of Persia, and the caliph Abū Bakr This work, which was finished by the author in 692,[7] has been extensively used by subsequent Syrian historians, both Jacobite and Nestorian, such as Bar Hebræus,[8] Elias bar Shīnāyā,[9] &c, and it is therefore admitted by 'Abhd ishō' into his list of books (*B O*, iii 1, 229) As a translator of Greek works Jacob deserves notice, not so much on account of any Aristotelian labours of his,[10] as because of his version of the *Homiliæ Cathedrales* of Severus, a work of capital importance, which he finished in 701[11] He also revised and corrected, with the help of Greek MSS, the abbot Paul's version of the *Octoechus* of Severus (see above, p 838)[12] The statement of Bar Hebræus[13] that Jacob translated the works of Gregory Nazianzen seems to be erroneous He merely retouched, we believe, the version of the abbot Paul (see above, p 838), to which he probably added notes, illustrative extracts from the writings of Severus, and Athanasius's redaction of the Συναγωγὴ καὶ ἐξήγησις ἱστοριῶν appended to the homily *In Sancta Lumina*[14] He made the Syriac version of the history of the Rechabites as narrated by Zosimus, which he is said to have translated from Hebrew into Greek and thence into Syriac[15] Of philosophical writings of his we may specify the *Enchiridion*, a tract on philosophical terms[16] The metrical composition on the same subject contained in two Vatican MSS may perhaps also be by him[17] As a grammarian Jacob occupies an important place in Syriac literature Nestorian scholars, such as Narsai and his pupils, more especially Joseph Hūzāyā (see above, p 836), had no doubt elaborated a system of accentuation and interpunction, which vies in minuteness with that of the Jews, and had probably begun to store up the results of their studies in Massoretic MSS of the Bible, like those of which we have already spoken (above, p 826) But Jacob was the first to give a decided impulse to these pursuits among the Western Syrians, and to induce the monks of Eusēbhōnā and Tell 'Addā to compile Massoretic MSS like those of their brethren in the East, and to pay attention to minute accuracy in the matter of the diacritical points and the signs of interpunction Hence we usually find appended to such MSS of the Jacobite schools the epistle of Jacob to George, bishop of Serūgh, on Syrian orthography,[18] and a tract by him on the pointing of verbal and nominal forms and on the signs of interpunction and accentuation, besides a tract of apparently earlier date on the same signs, with a list of their names, by Thomas the deacon[19] Further, Jacob's acquaintance with the Greek language and Greek MSS suggested to him a striking simplification of the system of vowel-points which was now probably beginning to be introduced among the Easterns[20] He saw that all the vowel sounds of the Syriac language, as spoken by the Edessenes, could be represented by means of the Greek vowel letters, a style of pointing which would be far clearer to the reader than a series of minute dots Accordingly he, or his school, put ⲁ for ă, o for ŏ (ā), ε for e, H for ī, oy for u, and this system has been adhered to by the Western Syrians or Jacobites since his time[21] Jacob wished, however, to go a step further, and sought to introduce a reform for which his countrymen were not prepared The constant perusal of Greek MSS had accustomed him to see the vowels placed on an equality with the consonants as an integral part of the alphabet, and, considering how much this contributed to clearness of sense and facility of reading, he desired to see the like done in Syriac For this purpose he himself designed a set of vowel signs, to be written on a line with and between the consonants[22], and for the purpose of making this invention known to his countrymen he wrote a *Syriac Grammar*,[23] in which he used them largely in the paradigms The innovation, however, found no favour, and the work was supposed to be utterly lost, until a few fragments (partly palimpsest) were simultaneously discovered by the present writer and Dr Neubauer[24] Finally, amid all his labours as priest and bishop, teacher and author, Jacob found time to correspond with a large number of persons in all parts of Syria, and these epistles are often among his most interesting writings[25] One of his principal correspondents was John the Stylite of the convent of Litarba (Λίταρβα plur, but also Λίταργον, Ἀύταργον, al-Athārib, near Aleppo), others were Eustathius of Dārā, Kyriaсōnā of Dārā, the priest Abraham, the deacon George, and the sculptor Thomas[26] To the priest Addai he wrote on the orders of baptism and the consecration of the water,[27] to the deacon Bar-hadh-bĕ shabbā against the council of Chalcedon,[28] to the priest Paul of Antioch on the Syriac alphabet, in reply to a letter about the defects of the said alphabet as compared with the Greek,[29] and to George, bishop of Serūgh, on Syriac orthography (see above)

After Jacob we may name his friend Athanasius of Balad, who Athanasius II
also studied under Severus Sēbōkht at Ken neshrē, and devoted of Balad
himself to the translation of Greek works, philosophical and theological, in the convent of Mār Malchus in Tūr 'Abhdīn or at Nisibis, where he for a time officiated as priest He was advanced to the patriarchate in 684 and sat till 687 or 688[30] In the year 645 he translated the *Isagōgē* of Porphyry, with an introduction, which seems to be chiefly derived from the preface of the Greek commentator Ammonius[31], and he also edited a version of an anonymous

[7] See Elias bar Shīnāyā in Rosen, *Catal*, p 88, col 1 [8] *B O*, ii 313 314

[9] See, for example, the notes in Abbeloos, *Bar Hebr æi Chron Eccles*, ii 55, 103, 107, 123, Baethgen, *Fragmente syr u arab Historiker*, extracted from Elias bar Shīnāyā, p 3, and the anonymous epitomizer in Land, *Anecd Syr*, i 2 22, transl pp 103 121 (Brit Mus Add 14643, Wright, *Catal*, p 1040)

[10] Even the translation of the *Categories* in Cod Vat clviii (*Catal*, iii 306, comp Renan, *De Philos Peripat ap Syros*, p 34) is not by him, but by Sergius of Rās'ain (see above, p 834)

[11] See *B O*, i 491, Cod Vat cxlii, Brit Mus Add 12159, dated 868 (Wright, *Catal*, p 534 sq)

[12] *B O*, i 487, Cod Vat xciv, written between 1010 and 1033, Brit Mus Add 17134, dated 675 (Wright, *Catal*, p 330 sq)

[13] *B O*, ii 307, col 2, iii 1, 23, col 1

[14] See Wright, *Catal*, pp 423 427 [15] *Ibid*, p 1128 [16] *Ibid*, p 984

[17] Cod Vat xxxvi and xcv (*Catal*, ii 243 and 516) In the latter there are three other poems ascribed to him, the first theological, the second with the title *De Philosophis et Bonis Artibus*, and the third entitled *On the Mind* In the MSS these poems are said to be by Jacob of Serūgh, which seems altogether unlikely

[18] See *B O*, i 477 (No 6) and p 478 (No 8)

[19] See, for example, *Catal Vat*, iii 290, Brit Mus, Rosen, pp 69, 70 (Wright, p 110), Paris, Zotenberg, *Catal*, p 30 The letter and tracts have been published by Phillips, *A Letter by Mār Jacob, Bishop of Edessa, on Syriac Orthography*, &c (1869, the third Appendix, pp 85 96, 1870), and Martin, *Jacobi ep Edesseni Epistola ad Georgium episc Sarugensem de Orthographia Syriaca* (1869) On the possible identity of Thomas the deacon with Thomas of Harkel, see Phillips, third Appendix, p 90

[20] In the year 899 we find the fully developed Nestorian system of vowel points in use (Brit Mus Add 12138, see the facsimile in Wright's *Catal*, pl xiii) We may therefore fairly place its beginnings as early as Jacob's time

[21] The credit of inventing this vowel system is usually given to Theophilus of Edessa, who died in 785 786 (*B O*, i 64, 521), though Wiseman brought forward to our mind convincing arguments in his *Horæ Syriacæ*, pp 181 188, in favour of the claims of Jacob We have now, however, a MS of Jacob's own time in which these Greek vowels are distinctly appended to Syriac words See Brit Mus Add 17134, f 83b, in Wright's *Catal*, p 337, col 2, and pl vi In this plate, the handwriting of which cannot well be placed later than about 700, we find in l 1 the vowel ϒ (ypsilon) in the word [illegible], and in l 23 the vowel o in [illegible], both in black ink, besides others in red ink in lines 6, 17, 18, 21, 22, and 31 No one can doubt, we think, that these vowels were added *a pr manu*, especially if he compares their forms, particularly the *a*, with those of the Greek letters on the margin of pl v

[22] See Bar Hebræus in his *Kethābhā dhē Semhē*, as quoted by Martin, *Jacques d'Edesse et les Voyelles Syriennes* (*Journ Asiat*, 1869, vol xiii pp 458 459), or pp 194-195 of Martin's edition Jacob had already before him the example of the Mandaites, from whose alphabet his figure of [illegible] for e appears to be borrowed

[23] *B O*, i 475, 477

[24] See Brit Mus Add 17217, ff 37, 38, 14665, f 28, in Wright's *Catal*, pp 1168 73 These were reprinted, with the Oxford fragments (Bodl 159), by Wright in *Fragments of the* ܬܘܪܨ ܡܡܠܠܐ ܢܗܪܝܐ *or Syriac Grammar of Jacob of Edessa* (1871)

[25] Some are metrical, see Brit Mus Add 12172, ff 65a, 73a, 17168, f 15a

[26] See all these in Brit Mus Add 12172, ff 65 135 (Wright, *Catal*, pp 592 604) Three of these letters have been published, two by Wright in the *Journal of Sacred Literature*, new series, x (1867), p 430 sq, and one by Schröter in *Z D M G*, xxiv (1870), pp 261 300

[27] *B O*, i 486, No 11, Brit Mus, Add 14715, f 170a, see also Add 12154, ff 47a, 52b [28] Brit Mus Add 14631, f 11b [29] *B O*, i 477, No 7

[30] *B O*, ii 335, Bar Hebræus, *Chron Eccles*, i 287, 293 Dionysius of Tell Mahrē places his death as late as 704

[31] Cod Vat clviii, Paris, Anc fonds 161 According to Renan, *De Philos Peripat ap Syros*, p 30, note 4, the MSS clxxviii and cxcvi of the Bibl Palat Medic contain this translation and not that of Honain.

Isagōgē, which is found in Brit. Mus. Add. 14660.[1] At the request of Matthew, bishop of Aleppo, and Daniel, bishop of Edessa, he undertook in 669 a translation of select epistles of Severus of Antioch, and of these the sixth book survives in two MSS.[2] He also busied himself with Gregory Nazianzen, as is evidenced by a scholion introductory to the homilies[3] and the version of the Συναγωγὴ καὶ ἐξήγησις ἱστοριῶν.[4] The only other writings of his with which we are acquainted are an encyclical letter, prohibiting Christians from partaking of the sacrifices of their Muhammadan rulers,[5] and a couple of sedrās.[6]

Januarius Candidatus. Contemporary with him, and probably an alumnus of the same school, was the translator of the poems of Gregory Nazianzen, in the year 655, whom Assemani calls Senorinus Chidulatus of Āmid.[7] He has, however, misread the name. In the MS., as Professor Guidi informs us, it stands ܝܢܘܪܝܣ ܩܢܕܝܕܛܘܣ, not ܣܢܘܪܝܣ. The former part of the name seems to be Ἰανουάριος, the latter is apparently (as Guidi suggests) a corruption of Κανδίδατος. Whether the poems in Brit. Mus. Add. 18821 and 14547[8] belong to the translation of Januarius Candidatus or not, we cannot at present determine.

George, bishop of the Arab tribes. Another scholar of note at this time is George, bishop of the Arab tribes, the pupil and friend of Athanasius II. and Jacob.[9] He was ordained, it would seem, in 687 or 688, two months after the death of Athanasius, and is said to have died in the first year of Athanasius III., who was consecrated in April 724. His diocese comprised the 'Akōlāyē or Arabs of 'Ākōlā (al-Kūfah), the Tū'āyē (?), the Tanūkh, the Tha'labites, the Taghlibites, and in general the nomad Arabs of Mesopotamia. Of his works the most important is his translation of the *Organon* of Aristotle, of which there is a volume in the British Museum, Add. 14659, comprising, in its imperfect condition, the *Categories*, Περὶ ἑρμηνείας, and the first book of the *Analytics*, divided into two parts, with introductions and commentaries.[10] Of this version a specimen has been edited by Hoffmann, *De Hermeneuticis*, &c., p. 22 *sq.*, besides small fragments at pp. 30, 38, 45, and 53. He also compiled a large collection of scholia on the homilies of Gregory Nazianzen, which exhibits a wide range of reading,[11] and completed the *Hexaëmeron* of Jacob of Edessa (see above, p. 839).[12] His other writings are—a commentary, or more likely scholia, on the Scriptures, cited in the *Catena* of Severus and by Bar Hebræus in his *Ausar Rāzē*;[13] a short commentary on the sacraments of the church, treating of baptism, the holy Eucharist, and the consecration of the chrism;[14] a homily in twelve-syllable metre on the holy chrism in two shapes;[15] another homily on solitary monks, in heptasyllabic metre;[16] and a treatise on the *Calendar* in twelve-syllable metre,[17] cited by Elias bar Shīnāyā.[18] Like Jacob of Edessa, he carried on an extensive literary correspondence, of which some specimens have luckily been preserved in Brit. Mus. Add. 12154, ff. 222-291, dated from 714 to 718. Several of them are addressed to John the Stylite of Litarba, one of whose letters to Daniel, an Arab priest of the tribe of the Tū'āyē, is appended, f. 291. The most important of them is one written to the priest and recluse Yēshū' of Inmb (near 'Azāz, north of Aleppo), part of which relates to Aphraates and his works (see above, p. 827).[19]

Daniel of Salah. Contemporary with these scholars was Daniel of Salah (a village north-east of Midyād in Tūr-'Abdīn),[20] who wrote commentaries on the Psalms and Ecclesiastes.[21] The former was in three volumes, and was composed at the request of John, abbot of the convent of Eusebius at Kaphrā dhĕ-Bhārthā (Kafr al-Bārah, near Apamea).[22] There is an abridgement of it in Brit. Mus. Add. 17125, f. 81 *sq.* The commentary on Ecclesiastes is known to us only from the extracts preserved in Severus's *Catena*.[23]

George of Martyropolis. Regarding George, bishop of Martyropolis,[24] we can add little or nothing to the scanty information collected by Assemani.[25] This scholar has, however, made a mistake in placing him so early as "circa annum Christi 580." About a century later would probably be nearer the mark. Two of his pupils were Constantine, bishop of Harrān, who may have flourished during the latter part of the 7th century, and his successor Leo, who lived at the very end of it and the beginning of the 8th.[26] Constantine wrote several controversial works against the Monophysites, viz.,—an exposition of the creeds of the councils of Nicæa and Chalcedon, a treatise against Severus (of Antioch), an "anagnōsticon" concerning an alleged mutilation of the Trisagion,[27] and a reply to a treatise of Simeon (II., Monophysite bishop of Harrān).[28] Leo's only literary effort appears to have been a letter to the Jacobite patriarch Elias, whom we have next to notice.

Elias belonged originally to the Dyophysite party in the Syrian Patriarch Church, but was converted to the Monophysite sect by the study of the writings of Severus. He was a monk of the convent of Gubbā Barrāyā, and for eighteen years bishop of Apamea (or Fāmiyah), before he was raised to the patriarchate of Antioch (in 709). He died in 724.[29] The only work of his known to us is an *Apology*, addressed to Leo, bishop of Harrān, in answer to a letter from him asking the reasons for Elias's change of creed.[30] It was probably written during the time of his episcopate. In it, besides George of Martyropolis and Constantine of Harrān, he cites John of Damascus, among whose Greek works is a tract against the Jacobites, addressed to the bishop Elias in defence of Peter, archbishop of Damascus.

Lazarus of Bēth Kandasā. Lazarus of Bēth Kandasā is known to us only through his disciple George of Bēth Nīkē as the compiler of a commentary on the New Testament, of which there are two volumes in the British Museum, the one (Add. 14682) containing the Gospels of St John and St Mark, the other (Add. 14683) the third and fourth parts of the Pauline epistles from Galatians to Hebrews.[31] The commentary on the epistles is merely an abridgement of Chrysostom; in that on the Gospels use is also made of Jacob of Sĕrūgh, and occasionally of Theodore of Mopsuestia,[32] Cyril of Alexandria, and Ephraim. He also quotes a passage of nine lines from the Sibylline oracles (ed. Friedlieb, viii. 287-296). At the end of part third of the Pauline epistles there is in Add. 14683 a chronological section, terminating with the accession of the 'Abbāsī caliph al-Mahdī in 775, which probably fixes the date of the author.[33] Much later he cannot have lived, as Add. 14683 is a MS. of the 10th century, having been presented to the convent of St Mary Deipara in Skete by the patriarch Abraham (or Ephraim), who sat from 977 to 981. In Brit. Mus. Add. 18295 there is a scholion by Lazarus explanatory of a passage in (pseudo-)Dionysius Areopagita.[34]

Daniel bar Moses. About this time too may have lived the chronicler Daniel bar Moses the Jacobite, who is cited as an authority by Elias bar Shīnāyā in the years 122, 127, and 131 of the Hijrah, *i.e.*, from 740 to 749 A.D.[35]

Theophilus of Edessa. Theophilus bar Thomas of Edessa[36] is stated by Bar Hebræus[37] to have been by religious profession a Maronite. He was addicted to the study of astrology, and an anecdote is related by Bar-Hebræus of his correspondence with Hasanah, the concubine of the caliph al-Mahdī, which fixes the date of his death in 785. He was the author of a history, which Bar-Hebræus cites[38] and commends. He also translated into Syriac "the two books of the poet Homer on the conquest of the city of Ilion."[39] This evidently means a version of the entire *Iliad* and *Odyssey*, incredible as it may appear. De Lagarde was, we believe, the first to discover citations of this work by Jacob, or Severus, bar Shakkō, bishop of

1 See Wright, *Catal.*, p. 1161, and comp. Renan, *op. cit.*, p. 31.

7 Cod. Vat. xcvi. (*Catal.*, ii. 521); see *B. O.*, ii. cxlix., 502, col. 2, iii. 1, 23, note.
8 Wright, *Catal.*, pp. 775, 438, col. 1.
9 *B. O.*, i. 494; Bar Hebræus, *Chron. Eccles.*, i. 293, 303; Hoffmann, *De Hermeneuticis apud Syros Aristoteleis*, pp. 148-151; Renan, *De Philos. Peripat. ap. Syros*, pp. 32-33. 10 See Wright, *Catal.*, p. 1163.
11 Brit. Mus. Add. 14725, ff. 100-215. It was evidently written after the death of Athanasius II., as shown by the remark on f. 132a (Wright, *Catal.*, p. 443, col. 1). The commentary contained in Brit. Mus. Add. 17197, ff. 1-25 (Wright, *Catal.*, p. 441) is perhaps that of Elias, bishop of Singār (Sinjār), who flourished about 750, and is expressly stated (*B. O.*, ii. 339) to have compiled a commentary on the first volume of Gregory Nazianzen (as translated by Paul). He followed the older exposition of Benjamin, bishop of Edessa. This Benjamin was the writer of a letter on the Eucharistic service and baptism (Wright, *Catal.*, p. 1004, col. 2).
12 See Land, *Anecd. Syr.*, i. p. 4.
13 *B. O.*, i. 494-495; comp. Wright, *Catal.*, p. 909, col. 2.
14 Wright, *Catal.*, p. 985.
15 *B. O.*, i. 332; *Catal. Vat.*, iii. 102, No. 188; Wright, *Catal.*, p. 848, No. 78.
16 *Bodleian Catal.*, p. 425, No. 88. 17 *B. O.*, i. 495; *Catal. Vat.*, iii. 532.
18 Rosen, *Catal.*, p. 88, Nos. 32, 33; comp. also the "Table of the New Moons," in *Catal. Vat.*, ii. 402.
19 It has been printed by De Lagarde, *Anal. Syr.*, pp. 108-134, and partly reprinted by Wright, *The Homilies of Aphraates*, pp. 19-37. Ryssel has translated and annotated it in *Ein Brief Georgs, Bischofs der Araber, an d. Presbyter Jesus*, 1883. 20 See Hoffmann in *Z. D. M. G.*, xxxii. 741.
21 According to a note in Payne Smith's *Catal.*, p. 62, he was bishop of Tellā dhĕ Mauzĕlath; but at the time when he wrote his commentary on the Psalms he was certainly only a priest and abbot of a convent (see Wright, *Catal.*, p. 605, col. 2).
22 MSS.—part i., Pss. i.-l., Brit. Mus. Add. 17187; part ii., Pss. li.-c., Add. 14670, 14668 (only three leaves) (see Wright, *Catal.*, pp. 605-606); Cod. Vat. clv., Pss. i.-lxviii. (*Catal. Vat.*, iii. 297); part iii., Pss. ci.-cl., in Arabic, Berlin, Sachau 55. It is frequently cited by Bar Hebræus in the *Ausar Rāzē* in Severus's *Catena*, and also by Antonius Rhetor (Wright, *Catal.*, p. 831, col. 1).

23 *Catal. Vat.*, iii. 17; Wright, *Catal.*, p. 909.
24 *I.e.*, Mayperkat or Mayyāfārikīn. Assemani calls him bishop of Taghrith or Tekrit.
25 *B. O.*, i. 465, iii. 96. The epistles to Christopher against Probus and John Grammaticus of Alexandria, and to the monks of the convent of Mār Matthew, are also cited in Brit. Mus. Add. 17197 (Wright, *Catal.*, p. 607).
26 Assemani places Constantine as early as 630 and Leo about 640 (*B. O.*, i. 466-467). But in the *Catal. Vat.* they are more correctly described as "uterque S. Johannis Damasceni æqualis" (vol. iii. 255).
27 These three are mentioned by Assemani, *B. O.*, i. 466.
28 Wright, *Catal.*, p. 607, col. 2.
29 *B. O.*, ii. 95, 337; Bar Hebræus, *Chron. Eccles.*, i. 297; Baethgen, *Fragmente*, pp. 46, 123. Dionysius of Tell Mahrē wrongly places his death some years later, in 729.
30 Two MSS. of this work survive, but both imperfect, the one at Rome, Cod. Vat. cxlv. (*Catal.*, iii. 253), the other in the British Museum, Add. 17197 (Wright, *Catal.*, p. 606). 31 See Wright, *Catal.*, pp. 608-612.
32 Sachau, *Theodori Mops. Fragmenta Syr.*, pp. 101 and 62.
33 The words of George of Bēth Nīkē, *buhhānā dhe dhogmā* (Wright, *Catal.*, p. 611, col. 2), probably refer to the liturgical disputes which arose among the Jacobites about this time (*B. O.*, ii. 341) and attained considerable importance a little later (p. 343). See Bar Hebræus, *Chron. Eccles.*, i. 331.
34 See Wright, *Catal.*, p. 1184.
35 See Baethgen, *Fragmente*, p. 2; Bar Hebræus, *Chron. Eccles.*, ii. 152, note 2.
36 *B. O.*, i. 521; Cardāhī, *Liber Thesauri*, p. 39.
37 *Hist. Dynast.*, p. 228 (transl., p. 147). 38 *Op. cit.*, p. 98 (transl., p. 63).
39 *Op. cit.*, p. 228 (transl., p. 148). Also at p. 40 (transl., p. 26) Bar Hebræus says that "the poet Homer bewailed her (fall) in two books, which Theophilus the astrologer of Edessa translated from Greek into Syriac."

Mār Matthew, who died in 1241.[1] Cardāh (*Liber Thesauri*, p. 40) quotes the rendering of *Iliad* ii. 204, but without saying where he found it. Theophilus is often spoken of as the first to use the Greek vowels in pointing Syriac words, but we have seen above (p. 840, note 21) instances of their occurrence in MSS. older than his time. Perhaps, however, he may have finally settled some details of the system and assisted in bringing it into more general use.[2]

George of Bē'elthān.

George of Be'elthān, a village near Hims, was educated at the convent of Ken-neshrē, and became the syncellus of Theodore, bishop of Samosāta, who prophesied great things of him. On the death of Athanasius III. a synod was held at Mabbōgh, at the close of 758, when a large majority of those present raised George, who was only a deacon, to the see of Antioch.[3] At the instigation of the anti-patriarch David, the caliph al Mansūr scourged him and threw him into prison, where he remained for nine years, till he was set free by his son and successor al Mahdī. He was taken ill during one of his diocesan journeys at Kalaudiyah (Claudia), in the far north of Mesopotamia, and died in the convent of Bar saumā near Mehtēne (Malatyah), in 790.[4] During his long imprisonment George is said to have composed many discourses and metrical homilies. He was also the author of a commentary on the Gospel of St Matthew, the unique but imperfect MS. of which has been described by Assemani in *Catal. Vat.*, iii. 293.

Cyriacus.

Cyriacus, a man of Taghlitan family[5] and a monk of the convent of Bīzōnā, otherwise called the convent of the Pillar, near Callinicus, was ordained patriarch of the Jacobites in 793, and died at Mosul in 817. The record of his troubled life may be read in Bar-Hebræus's *Chron. Eccles.*, i. 329 *sq.*; *B. O.*, ii. 116, 341-344. In the year 798 he endeavoured to effect a union with the Julianists, whose patriarch was Gabriel, and a creed was drawn up and signed by them and sundry other bishops, which has been preserved in Brit. Mus. Add. 17145, f. 27b.[6] Besides an anaphora[7] and canons,[8] he wrote a homily on the parable of the vineyard[9] and a synodical epistle on the Trinity and the incarnation addressed to Mark, patriarch of Alexandria, which is extant only in Arabic.[10]

The number of Nestorian writers during the 7th and 8th centuries is relatively much larger than that of Jacobite, and the loss of many of their writings is much to be regretted, especially those bearing on ecclesiastical and political history. Want of space compels us, however, to omit many names which we would otherwise gladly have noticed.

Bābhai the archimandrite.

Our list begins with the name of Bābhai the archimandrite,[11] called Bābhai the Elder, to distinguish him from the later Bābhai bar Nĕsībhnāyē. He was a native of the village of Bēth 'Amāthā or Bā-'amāthā in Bēth Zabhdai, and succeeded Mār Dādh-īshō' (see above, p. 838) as abbot of the great convent on Mount Izlā. On the death of the catholicus Gregory of Kashkar in 607 (see above, p. 837) a time of persecution followed, during which the Nestorian Church was ruled by Bābhai with a firm and skilful hand. The bishops of Nisibis, Hĕdhaiyabh, and Karkhā dhĕ Bēth Slōkh (or Bēth Garmai) entrusted him with the duties of inspector of convents, with the express object of rooting out all who held the doctrines of the *Mĕṣallĭyānē*,[12] as well as the followers of Hannānā of Hĕdhaiyabh and Joseph of Hazzā.[13] So well did he acquit himself in this post[14] that, after the murder of Khosrau II. in 628, when his successor Kawādh II. Shērōe permitted a synod to be held, he would have been unanimously elected to the dignity of catholicus, had he only given his consent, in default of which the choice fell upon Īshō'-yabh of Gĕdhālā (628-644). As a writer Bābhai would seem to have been very prolific, for no less than eighty-three or eighty-four works are set down to his account.[15] The principal of these, as enumerated by 'Abhd-īshō', are—a commentary on the whole text of Scripture; on the commemorations of the Blessed Virgin Mary and St John, and other commemorations and feasts throughout the year; on the reasons of the celebration of Palm Sunday and of the festival of the holy cross[16]; a discourse on the union (of the two natures in our Lord, against the Monophysites)[17]; exposition of the *Centuries* of Evagrius[18]; exposition of the discourses of Mark the monk (on the spiritual law)[19]; rules for novices; canons for monks; (controversial) letters to Joseph Hazzāyā; history of Diodore of Tarsus and his followers; on Matthew the wanderer, Abraham of Nisibis, and Gabriel Katrāyā.[20] To these must be added an account of the life and martyrdom of his contemporary George, a convert from Zoroastrianism, whose heathen name was Mihrāmgushnasp,[21] and a few hymns, contained in Nestorian psalters.[22]

Īshō'-yabh II.

The successor of Bābhai was, as we have just mentioned, Īshō'-yabh II. of Gĕdhālā,[23] who was elected in 628 and sat till 644.[24] He studied at Nisibis, and was bishop of Balad at the time of his elevation to the patriarchate. He was sent in 630 by Bōrān, the daughter of Khosrau II., on an embassy to Heraclius, the emperor of Constantinople, whom he met at Aleppo, and to whom, we are told, he restored the holy cross, which had been carried off by the Persians when they captured Jerusalem in 614.[25] Foreseeing the downfall of the enfeebled Persian monarchy, Īshō'-yabh prudently made conditions on behalf of his flock with the Muhammadan ruler, it is said through the intervention of a Christian chief at Najrān and of Yēshū' (or Īshō'), bishop of that place.[26] The deed or ordinance containing the terms of agreement was renewed and confirmed by 'Omar ibn al Khattāb.[27] According to 'Abhd-īshō', the principal writings of Īshō'-yabh were a commentary on the Psalms and sundry epistles, histories, and homilies. A hymn of his occurs in the Nestorian psalter Brit. Mus. Add. 14675.[28]

Sāhdōnā.

Sāhdōnā of Halamūn, a village in Bēth Nuhādhrē,[29] was educated at Nisibis, and became a monk under Mār Jacob, the founder of the famous convent of Bēth 'Ābhē.[30] Here he composed a treatise in two volumes on the monastic life, besides a history of his master, and a funeral sermon on him.[31] He became bishop of Māhōzē dh'Arēwān in Bēth Garmai,[32] and was one of the Nestorian clergy who accompanied Īshō'-yabh of Gĕdhālā on his embassy to Heraclius. Whilst halting at Apamea, Īshō'-yabh, John the Nestorian bishop of Damascus, and Sāhdōnā tried their hand at converting the monks of a neighbouring (Jacobite) convent, the result of which was that Sāhdōnā himself was converted,[33] and afterwards wrote several heterodox works. This incident caused much scandal in the East, as may be seen from the numerous letters which Īshō'-yabh of Hĕdhaiyabh, another member of the embassy, found it necessary to write upon the subject.[34]

Īshō'-yabh III. of Hĕdhaiyabh.

This Īshō'-yabh was the son of a wealthy Persian Christian named Bas-tuhmag, of Kuphlānā in Hĕdhaiyabh or Adiabēnē, who used often to visit the convent of Bēth 'Ābhē.[35] He was educated at the school of Nisibis, became bishop of Mosul, and afterwards metropolitan of Hazzā (Arbēl or Irbil) and Mosul. The chief event of his rule at Mosul seems to have been that he hindered the Jacobites from building a church in that city,[36] notwithstanding that they were supported by all the weight and influence of the Taghlitans.[37] Bar-Hebræus declares that he bribed right and left to effect this.[38] He was one of those who accompanied Īshō'-yabh of Gĕdhālā on his embassy to Heraclius,[39] and stole a very costly and beautiful casket, containing relics of the Apostles, from a church at Antioch, the which he conveyed (apparently quite openly and shamelessly) to the convent of Bēth 'Ābhē.[40] On the death of Mār emmēh[41] (who sat 644-647)[42] he was elevated to the dignity of catholicus,[43] which he held till 657-658.[44] In his desire to do something for the promotion of learning he wished to found a school in the convent of Bēth 'Ābhē, where he had built a magnificent church, but the abbot Kām-īshō' and the rest of the lazy brotherhood would have none of this, and preferred to quit the convent and withdraw to the neighbouring village of Herpā in Saphsāphā.[45] Hereupon the catholicus gave up this part of his plan and built his college in his father's village of Kuphlānā (or Kulpānā).[46] Soon afterwards he found himself involved in another and more serious dispute with Simeon,

[31] *B. O.*, iii. 1, 463, 462.

[32] See *B. O.*, iii. 1, 116, col. 1, at the foot. Assemani pronounces the name Aryūn, but Arēwān is more likely to be correct. See Hoffmann, *Auszüge*, p. 277.

[33] We cannot see that Assemani has any ground for asserting that Sāhdōnā was converted "ab erroribus Nestorianis ad Catholicam veritatem" (*B. O.*, iii. 1, 107, col. 1; comp. col. 2, ll. 10-12, and p. 120, col. 2, ll. 11-13).

[34] *B. O.*, iii. 1, 116-123. Bar-Hebræus (*Chron. Eccles.*, ii. 113) spitefully improves the occasion by making out that the catholicus Īshō'-yabh of Gĕdhālā himself was the pervert.

[35] *B. O.*, iii. 1, 472; Hoffmann, *Auszüge*, p. 226.

[36] *B. O.*, iii. 1, 114-115.

[37] Taghrith was always strongly Jacobite, and the Nestorians had no church there till 767 (see *B. O.*, iii. 1, 111, note 1; Hoffmann, *Auszüge*, pp. 190-191; Bar-Hebræus, *Chron. Eccles.*, ii. 155-157).

[38] *Chron. Eccles.*, ii. 127.

[39] *B. O.*, iii. 1, 106, col. 1.

[40] There is no reason to doubt the circumstantial recital of a Nestorian writer, *B. O.*, iii. 1, 106, col. 2, 475. Strange to say, Assemani does not improve this occasion!

[41] Properly Mār(i) emmēh (see *B. O.*, ii. 789, col. 2, No. 20).

[42] According to others, 647-650; *B. O.*, ii. 420, iii. 1, 113, 615.

[43] In 647 or 648.

[44] Or, according to the other reckoning, till 660; *B. O.*, *locc. citt.* He predeceased the maphrīān Denhā, who died in 660 (Bar-Hebræus, *Chron. Eccles.*, ii. 129, 131).

[45] See Hoffmann, *Auszüge*, pp. 223, 227.

[46] *B. O.*, iii. 1, 121-123.

the metropolitan of Rēv Ardashīr[1] in Persis and of the Katrāyē,[2] who refused obedience to him as his diocesan, and this led to a lengthy correspondence, regarding which see *B. O.*, iii. 1, 127-136. His works, as enumerated by 'Abhd-ishō', are—*Ḥuppākh Ḥushshābhē* or "Refutation of (Heretical) Opinions,"[3] written for John, metropolitan of Bēth Lāpāt,[4] and other controversial tracts, consolatory and other discourses, various hymns,[5] and an exhortation to certain novices. He arranged the Hudhrā[6] or service book for the Sundays of the whole year, for Lent, and for the fast of Nineveh,[7] and drew up offices of baptism,[8] absolution,[9] and consecration.[10] He also wrote a history of the monk Ishō' sabhran, a convert from the religion of Zoroaster and a Christian martyr.[11] A large collection of his letters is extant in Cod. Vat. clvii. (*Catal.*, iii. 299), a judicious selection from which would be worth printing.[12]

'Ānān Ishō'

'Ānān-Ishō'[13] of Ḥĕdhaiyabh and his brother Ishō' yabh were fellow students at Nisibis with Ishō'-yabh III., and afterwards entered the great convent on Mount Izlā. Ishō' yabh subsequently became bishop of Kārdāliyābhādh[14], but 'Ānān-Ishō' was seized with a fit of wandering, and visited Jerusalem, whence he went on to the desert of Skete in Egypt, and made himself thoroughly acquainted with the lives and habits of its monks, regarding whom he had read so much in the *Paradise* of Palladius. On his return he soon forsook the great convent, because of dissensions that had arisen in it, and betook himself with his brother to the convent of Bēth 'Ābhē, where he devoted himself to study, and so distinguished himself that he was employed by Ishō'-yabh III. to assist in arranging the Hudhrā (see above). 'Ānān-Ishō' wrote a volume of philosophical divisions and definitions, with a copious commentary, dedicated to his brother,[15] and compiled a work on the correct reading and pronunciation of difficult words in the writings of the fathers,[16] thus following in the footsteps of Joseph Hūzāyā (see above, p. 836), and anticipating Jacob of Edessa and the monks of the convent of Karkaphēthā (see above, p. 826). He was also the author of a treatise entitled *Liber Canonum de Æquilitteris*, i.e., on the different pronunciation and signification of words that are spelt with the same letters. This has been published, with the additions of Honain ibn Isḥāk of al-Ḥīrah (died in 873) and another compiler, by Hoffmann, *Opuscula Nestoriana*, pp. 2-49.[17] His greatest work, however, was a new recension or redaction, in two volumes, of the *Paradise* of Palladius and Jerome, with additions collected by himself from other sources and from his own experience.[18] This he compiled at the request of the patriarch George, and it became the standard work on the subject in the Nestorian convents.[19]

John of Bēth Garmai

John of Bēth Garmai (Garmĕkāyā), called John the Elder, was a disciple of Jacob of Bēth 'Ābhē, and his successor as abbot of that convent. After a few months, however, he secretly fled from Bēth 'Ābhē and betook himself to a hill near Dākūkā[20] in Bēth Garmai, where the monastery of Ezekiel[21] was soon afterwards built, in which he ended his days.[22] His works, according to 'Abhd-ishō',[23] are—a collection of heads of knowledge or maxims, rules for novices, a brief chronicle, histories of Abraham, abbot of the great convent on Mount Izlā, of the monk Bar-'idtā,[24] and of Mār Khodhāhwai, the founder of the convent of Bēth Hālē (near al-Ḥadīthah, by Mosul), with a discourse and hymns on the last named.

Sabhr-ishō' Rustam

Sabhr-ishō' Rustam[25] was a native of a village called Ḥerem, in Ḥĕdhaiyabh, and entered the great convent on Mount Izlā under the abbot Narsai, the successor of Bābhai. Here, at the request of the monks, he wrote a tract on the occasion of the celebration of Golden Friday, and also a large volume of disputations against heresies and other theological questions. He migrated thence, perhaps along with Narsai, to Bēth 'Ābhē, where, however, he resided only for a short time, being invited by the monks of Bēth Kūkā[26] to become their prior. Here he composed eight discourses on the dispensation of our Lord, the conversion of the various countries by the Apostles, and on continence and the monastic life. Further, at the request of Mār Kardagh, the syncellus of Ishō'-yabh III., he wrote lives of Ishō' Zekhā (of the convent of Gassā), of Ishō' yabh III., of Abraham abbot of Bēth 'Ābhē, who came thither from the convent of Zekhā-ishō',[27] of Kām-ishō' abbot of Bēth 'Ābhē,[28] of Abraham of Nethpar, of rabban Iyōbh (or Job) the Persian, and of the elder Sabhr-ishō', the founder of the convent of Bēth Kūkā,[29] to which may be added the lives of the brothers Joseph and Abraham.[30]

George of Kaphrā

George, the pupil and successor of Ishō' yabh III., was a native of Kaphrā in Bēth Gĕwāyā, a district of Bēth Garmai.[31] His parents were wealthy, and owned two farms in the neighbourhood of the convent of Bēth 'Ābhē. Being sent to take charge of these, he got acquainted with the monks and ultimately joined their body. When Ishō' yabh was promoted to the patriarchate he appointed George to be metropolitan of Ḥĕdhaiyabh in his stead[32], and, on the death of his friend, George succeeded to the patriarchate in 661, and sat till 680. As an author he is not of much account, having written merely a few homilies, with hymns and prayers for certain occasions, and published nineteen canons.[33] His too in all probability is the "epistola dogmatica" contained in Cod. Vat. ccccLvii., p. 360.[34]

Elias of Merv

Elias, bishop of Marū or Merv, was one of those who were present at the death of Ishō'-yabh III. and elected George as his successor.[35] He compiled a *Catena patrum* (*Mallĕphānūthā dhĕ-Kadhmāyē*) on the four Gospels, and wrote commentaries on Genesis, Psalms, Proverbs, Ecclesiastes, the Song of Songs, Ecclesiasticus, Isaiah, the twelve minor Prophets, and the epistles of St Paul. His letters would probably be of some interest to us, and the loss of his ecclesiastical history, to which 'Abhd-ishō' applies the epithet of "trustworthy," is to be regretted.[36]

Daniel bar Maryam

Of Daniel bar Maryam we can only say that he flourished under Ishō' yabh III. of Ḥĕdhaiyabh, about 650.[37] He wrote an ecclesiastical history in four volumes, and an explanation of the calendar. The history is cited by George of Arbēl in the 10th century for the date of the destruction of Jerusalem.[38]

Gabriel Taurēthā

Gabriel, surnamed Taurēthā, was a native of the province of Sinzūr or Shahrazūr.[39] He studied at Nisibis, and then entered the great convent on Mount Izlā, where he took part in a controversy with the Monophysite monks of the convent of Kartamīn (near Mārdīn) and against Sāhdōnā. He afterwards migrated to Bēth 'Ābhē, where he wrote a life of Mār Narsai the abbot, an account of the martyrs of Tūr Bērā'in or Tūr Bĕrēn (Ādhurparwā, Mihrnarsai, and their sister Māhdokht, in the ninth year of Sapor II.), a homily for the washing of the feet, &c.[40] He became abbot of Bēth 'Ābhē under the catholicus Ḥĕnān-ishō' I. (686-701).[41]

Ḥĕnān-Ishō' I.

Ḥĕnān-ishō' I., called the Elder or the Lame (*ḥĕghīrā*), was appointed catholicus in 686,[42] in succession to John bar Mārtā,[43] the follower of George. He was opposed by Ishō'-yabh of al-Baṣrah, whom he threw into prison, but afterwards released on his making his submission. A more serious rival was John of Dāsen, bishop of Nisibis, surnamed the Leper, who curried favour with the caliph 'Abd al-Malik ibn Marwān and procured the deposition of Ḥĕnān-ishō', whose place he occupied for nearly two years.[44] Bar-Hebræus adds[45] that John put him for some days into prison, and then sent him off to a convent among the mountains in charge of two of his disciples, who threw the luckless catholicus down a precipice and left him there for dead. Luckily he was found by some shepherds, who took good care of him, though he seems to have been lame ever after. On his recovery he withdrew to the convent of Yaunān (or Jonah)[46] near Mosul, where he stayed till the death of his rival. He continued to rule the Nestorian Church till 701,[47] and was buried

46 *B. O.*, ii. 424, note 3. Bar-Hebræus calls it "the convent of John."
47 According to Elias bar Shīnāyā in Baethgen, *Fragmente*, pp. 38, 120. Others say 699.

in the convent of Jonah.[1] Besides composing homilies, sermons, and epistles, he was the author of a life of Sergius Dĕwādhā[2] of Darankarah or Daukarah near Kashkar, who was a contemporary of his. He also wrote a treatise *On the Twofold Use of the School* or university, as a place of moral and religious training as well as of instruction in letters, and a commentary on the *Analytics* of Aristotle.[3]

Alāhā zĕkhā. Presumably to this century belong two ecclesiastical historians who are known to us only from the *Chronicle* of Elias bar Shīnāyā. Alāhā zĕkhā is quoted by him in regard to events that took place in 594-596 and 606.[4] Perhaps he is identical with that Alāhā zĕkhā to whom we find Īshō'yabh III. writing a letter whilst he was yet bishop, consequently in the earlier part of the century.[5]

Mīkhā. Mīkhā or Micah is cited by Elias as an authority for the years 594-596 and 605.[6]

David of Bēth Rabban. Passing over into the 8th century, we may mention David of Bēth Rabban, that is, of the convent of Zĕkhā-ishō', afterwards of Bēth 'Ābhē, who was the author of a monastic history, called *The Little Paradise*, which is frequently cited by Thomas of Margā. Its first chapter contained anecdotes relative to George Neshrāyā, Nathaniel, and other monks of Bēth 'Ābhē, who lived under Hĕnān-ishō' I., towards the end of the 7th century.[7] David attained episcopal dignity, though we do not know the name of his see. He wrote also a geographical treatise *Upon the Limits of Climates or Countries, and the Variations of the Days and Nights*.[8]

Bābhai bar Nĕsībhnāyē. Bābhai bar Nĕsībhnāyē (so called because his parents were of Nisibis) flourished under the catholicus Sĕlībhā zĕkhā (713-729), the successor of Hĕnān-ishō'.[9] He was a native of Gĕbhiltā or Jabiltā in Ṭirhān,[10] and is described by Thomas of Margā as being a tall, powerful man, with a magnificent voice, gentle and modest, and learned withal. He devoted himself to the reformation of the musical services of the Nestorian Church, which had fallen into sad confusion, and founded many schools, more particularly in the dioceses of Hĕdhayyabh and Margā, with the special object of promoting the study of church music. The most important of these were at Kĕphar 'Uzzēl[11] in Hĕdhayyabh and Bāshūsh in the district of Saphsāphā in Margā.[12] At the former he took up his residence, but used to visit and inspect the others once a year. In his latter years he returned to Gĕbhiltā and died there. He wrote discourses and homilies of different kinds, numerous hymns for various occasions, histories (of holy men), and letters.[13]

Bar Sāhdē. Bar Sāhdē of Karkhā dhē-Bhēth Sĕlōkh flourished, according to Assemani, under the catholicus Pethiōn (731-740).[14] 'Abhd-ishō' states that he wrote an ecclesiastical history[15] and a treatise against the Zoroastrian religion.

Abraham bar Dāshandādh. When Bābhai the Nisibene was residing at Kĕphar-'Uzzēl (see above), a woman from the village of Bēth Sayyādhē brought to him her crippled son, whom she called "only half a man," and begged him to bless him. "This is no half man," was the gentle monk's reply; "this shall be a father of fathers and a chief of teachers; his name and his teaching shall be famous throughout the whole East."[16] This was Abraham bar Dāshandādh "the Lame," whose works are enumerated by 'Abhd-ishō' as follows[17]—a book of exhortation, discourses on repentance,[18] letters, the book of the king's way, a disputation with the Jews, and a commentary on the discourses of Mark the monk.[19] He was teacher at the school of Bāshūsh in Saphsāphā, where the future catholicus Timothy I. received his early education, as well as his successor Īshō' bar Nōn and Abū Nūḥ al Anbārī.[20]

Mār-abhā II. Mār-abhā, the son of Bĕrīkh-sebhyānēh, was a native of Kashkar,[21] and became bishop of that town. From this see he was promoted in 741 to the dignity of catholicus.[22] At first he had some difficulties with the emir Yūsuf ibn 'Omar ath-Thakafī, but these were settled by a visit to al Kūfah, which gave him an opportunity of going also to al Ḥīrah, where he was received with great honour by the aged bishop John Azraḳ. He shortened his name to Abhā, the better to distinguish himself from his predecessor Mār-abhā I. (see above, p. 836). In the sixth year of his patriarchate he got into a dispute with his clergy about the management of the school at Seleucia, and withdrew to Kashkar, but returned to Seleucia before his death, which took place in 751, at the age, it is said, of 110 years. According to Bar-Hebræus, "he was learned in ecclesiastical works and in dialectics, and composed a commentary on Theologus (*i.e.*, Gregory Nazianzen),[23] and all his time he was occupied in reading books." 'Abhd-ishō' mentions him in two places, as Abhā of Kashkar[24] in *B.O.*, iii. 1, 154, and as Abhā bar Bĕrīkh-sebhyānēh at p. 157. In the former place he ascribes to him expositions, letters, and a commentary on the whole *Dialectica* of Aristotle,[25] and in the latter, *The Book of the Generals*, or *Military Governors*,[26] and other works.

Simeon bar Tabbākhē. Simeon bar Tabbākhē (the Butcher) of Kashkar held the important post of chief officer of the treasury under the caliph al Manṣūr,[27] about the same time that his co-religionist George bar Bōkht-ishō' of Gunde Shābhōr or Bēth Lāpāt,[28] in Khūzistān, was court physician.[29] The only work of his mentioned by 'Abhd-ishō' is an ecclesiastical history, which from his position at Baghdādh doubtless contained much valuable information.

Sūrēn. Sūrēn or Sūrīn,[30] bishop of Nisibis and afterwards of Ḥalah or Ḥolwān in Bēth Mādhāyē,[31] was raised to the patriarchate in 754, by the orders of Abān, the Muhammadan emir of al-Madāin (Seleucia). The bishops appealed to the caliph 'Abdallāh as-Saffāḥ,[32] and not in vain. The election was cancelled, and Jacob, bishop of Gundē Shābhōr, was chosen in his place (who sat till 773). Then continued squabbles, however, so irritated al Manṣūr that he gave orders to throw them both into prison. Sūrēn made his escape in time, but Jacob was caught and spent the next nine years under strict ward, during which time "the second Judas," 'Īsā ibn Shahlāthā or Shahlāfā,[33] deacon and physician, trampled the rights of the bishops under foot. On his release, he sent Sūrēn as bishop to al-Baṣrah, at the request of some of the Christian citizens, but others would not receive him, and their quarrels once more attracted the caliph's attention. Sūrēn, warned by 'Īsā, again made his escape, but was captured by the emir of al Madāin and died in prison.[34] The epithet of *Mĕphashshĕḳānā*, given to him by 'Abhd-ishō',[35] implies that he was either a commentator on Scripture or a translator of Greek works into Syriac. He composed a treatise against heretics, but the remainder of 'Abhd-ishō''s text is not clear in Assemani's edition.[36]

Cyprian of Nisibis. Cyprian, bishop of Nisibis, was appointed to that see in 741.[37] The great event of his life was the building of the first Nestorian church in the Jacobite city of Taghrīth, just outside of the walls, on the banks of the Tigris. The idea originated with Sĕlībhā-zĕkhā, bishop of Ṭirhān, but would never have been realized, had not Cyprian allowed the Jacobites to resume possession of the church of Mār Domitius at Nisibis. The building of the church at Taghrīth was commenced in 767.[38] Cyprian also erected a magnificent church at Nisibis, on which he expended the sum of 56,000 dinārs, in 758-759.[39] After this time it so happened that the patriarchs of the three Christian sects, Theodoret the Malkite, George the Jacobite, and Jacob the Nestorian, were all in prison at once at Baghdādh. 'Īsā the physician, thinking to improve the occasion to his own advantage, wrote to Cyprian that the caliph al Manṣūr coveted some of the golden and silver vessels of the church of Nisibis, hinting at the same time in pretty plain language that a handsome present to himself might be of some avail at this juncture. Cyprian had the courage to go straight to Baghdādh with the letter and show it to the caliph, who disgraced 'Īsā and confiscated his property,[40] releasing the three patriarchs at the same time.[41] Cyprian died in 767.[42] According to 'Abhd-ishō', he wrote a com-

1 His Arab biographer and co-religionist adds that his grave was opened 650 years afterwards, and his body found undecayed and looking as if he slept.
2 Not Dādhā. The word means "liable to fits," "epileptic," "crazy."

5 *B.O.*, iii. 1, 141, No. 35.
6 See Bar Hebræus, *Chron. Eccles.*, ii. 106 note 3, 107 note 2.
7 *B.O.*, iii. 1, 217 col. 2, 218 col. 1; see also pp. 49 note 1, 181 col. 1, l. 1.
8 *B.O.*, iii. 1, 255. The poems referred to by Assemani in note 1 are no doubt of much later date. The first of them is edited by Cardāhī in his *Liber Thesauri*, pp. 41-46. Cardāhī places David's death "in the year 800." Twenty-two very artificial poems "on the love of wisdom," ascribed to him, are printed in the *Directorium Spirituale* of John of Mosul, edited by the bishop Elias John Millos, 1868, pp. 172-214.
9 According to Elias bar Shīnāyā, in Baethgen, *Fragmente*, pp. 42, 47, 122, 124. Assemani (*B.O.*, ii. 430) gives 714-728.
10 Hoffmann, *Auszuge*, p. 188.

mentary on the theological discourses of Gregory Nazianzen and various forms of ordination.[1]

Timothy I.

Timothy I. was a native of Hazzā in Hĕdhaiyabh, and had been a pupil of Abraham bar Dāshandādh (see above, p. 844) at the school of Bāshūsh in Saphsāphā. He became bishop of Bēth Bāghēsh,[2] and stood well with the Muhammadan governor of Mosul, Abū Mūsā ibn Mus'ab, and his Christian secretary Abū Nūh al Anbārī.[3] On the death of Hĕnān īshō' II. in 779,[4] several persons presented themselves as candidates for the dignity of catholicus. Timothy got rid of Ishō' yabh, abbot of Bēth 'Ābhē, by pointing out to him that he was an old man, unfit to withstand his younger rivals, and by promising, if he himself were successful, to make him metropolitan of Hĕdhaiyabh, which he afterwards did. Meantime Thomas of Kashkar and other bishops held a synod at the convent of Mār Pethiōn in Baghdādh, and elected the monk George, who had the support of 'Īsā the court physician; but this formidable opponent died suddenly. Having by a mean trick obtained the support of the archdeacon Bĕrōe and the heads of the various colleges, Timothy managed at last to get himself appointed catholicus, about eight months after the death of his predecessor. He still, however, encountered strong opposition. Ephraim metropolitan of Gundē Shābhōr, Solomon bishop of al-Hadīthah, Joseph metropolitan of Marū or Merv, Sergius bishop of Ma'allĕthāyā, and others held a synod at the convent of Bēth Hālē, in which they made Rustam, bishop of Hĕnāthā,[5] metropolitan of Hĕdhaiyabh in place of Ishō' yabh,[6] and excommunicated Timothy, who retorted with the same weapon and deposed Joseph of Merv. Joseph brought the matter before the caliph al Mahdī, but, failing to gain any redress, in an evil hour for himself became a Muhammadan.[7] Once more Ephraim summoned his bishops to Baghdādh and excommunicated Timothy for the second time, with no other result than a counter excommunication and some disgraceful rioting, which led to the interference of 'Īsā and the restoration of peace.[8] Timothy was duly installed in May 780.[9] He made the bishops of Persia subject to the see of Seleucia, and appointed over them one Simeon as metropolitan with orders to enforce a stricter rule than heretofore.[10] In his days Christianity spread among the Turks, and the khākān himself is said to have become a convert.[11] Timothy's disgraceful response to the caliph ar Rashīd in the matter of the divorce of Zubaidah may be seen in *B.O.*, iii. 1, 161. He is said to have died in 204 A.H. = 819-820 A.D., or 205 = 820-821; but, if he really was catholicus for forty three years, his death cannot have taken place till 823.[12] 'Abhd-īshō' informs us that Timothy wrote synodical epistles, a volume on questions of ecclesiastical law, another on questions of various sorts, a third containing disputations with a heretic, viz., the Jacobite patriarch George, about 200 letters in two volumes, a disputation with the caliph al Mahdī or his successor al-Hādī (on matters of religion), and an astronomical work on the stars.[13] Bar Hebræus adds hymns for the dominical feasts of the whole year and a commentary on Theologus (Gregory Nazianzen).[14]

Anonymous historians.

In this century too we may place the two following historical writers, whose names and works are unfortunately known to us only through the mention made of them by a later annalist. (1) An anonymous author, the abbot of the great convent (of Abraham on Mount Izlā), cited by Elias bar Shīnāyā in his *Chronicle* under the years 740-741.[15] (2) An ecclesiastical historian called

Pethiōn.

Pethiōn, identified by Baethgen (*Fragmente*, p. 2, No. 6) with the catholicus of that name. This is, however, impossible, because the catholicus died in 740, whereas the *Ecclesiastical History of Pethiōn* is cited by Elias bar Shīnāyā under the years 765 and 768.

We conclude our enumeration of the Nestorian writers of this century with the name of another historian. In the *Bibl. Orient.*, iii. 1, 195, the text of 'Abhd īshō', as edited by Assemani, speaks of a writer named Ishō'-dĕnah, bishop of Kasrā. Other MSS., however, read Basrā (al Basrah), which is confirmed by Elias bar Shīnāyā in Baethgen's *Fragmente*, p. 2.

Ishō'-dĕnah.

The variation Dĕnah-īshō' in Bar-Hebræus (*Chron. Eccles.*, i. 334) is of no consequence, and even there the MSS. differ. Besides the usual homilies of sorts and some metrical discourses, he wrote an introduction to logic, a work entitled *The Book of Chastity*, in which he collected lives and anecdotes of holy men and founders of monasteries, and an ecclesiastical history in three volumes.[16] This valuable work is known to us only by a few citations in Bar Hebræus and Elias bar Shīnāyā. Those in Bar Shīnāyā[17] range from 624 to 714, but the extract in Bar-Hebræus[18] brings us down to 793.

Reverting now to the Jacobite Church, we shall find that the number of its literary men in the 9th century is not large, though some of them are of real importance as theologians and historians.

Dionysius Tell-Mahrē.

Dionysius Tell-Mahrāyā was, as his surname implies, a native of Tell-Mahrē, a village situated between ar Rakkah and Hisn Maslamah, near the river Balikh.[19] He was a student in the convent of Ken neshrē,[20] and on its destruction by fire[21] and the consequent dispersion of the monks he went to the convent of Mār Jacob at Kaisūm, in the district of Samosata.[22] He devoted himself entirely to historical studies,[23] which he seems to have carried on in peace and quiet till 818. The patriarch Cyriacus (see above, p. 842) had got entangled in a controversy with the monks of Cyrrhus and Gubbā Barrāyā about the words *lahmā shĕmaiyānā* ("the heavenly bread"), &c., in the Eucharistic service, which ended in the malcontents setting up as anti patriarch Abraham, a monk of the convent of Kartamīn. After the death of Cyriacus in 817, a synod was held in June 818 at Callinīcus (ar Rakkah), in which, after considerable discussion, Theodore, bishop of Kaisūm, proposed the election of Dionysius, which was approved by most of those present, including Basil I., maphriān of Taghrīth.[24] The poor monk was accordingly fetched to Callinīcus, received deacon's orders on Friday in the convent of Estūnā or the Pillar, priest's orders on Saturday in the convent of Mār Zakkai or Zacchæus, and was raised to the patriarchate in the cathedral on Sunday the first of Ābh, 818, the officiating bishop being Theodosius of Callinīcus. Abraham and his partisans, seeing their hopes disappointed, maintained their hostile attitude, which led afterwards to the usual scandalous scenes before the Muslim authorities.[25] Immediately after his installation, Dionysius commenced a visitation of his vast diocese, going first northwards to Cyrrhus, thence to Antioch, Kirkēsion (Kirkīsiyā), the district of the Khābhūr, Nisibis, Dārā and Kĕphar tūthā, and so back to Callinicus, where he enjoyed the protection of 'Abdallāh ibn Tāhir against his rival Abraham. He did not on this occasion visit Mosul and Taghrīth, because the maphriān Basil thought the times unfavourable.[26] In 825 'Abdallāh ibn Tāhir was sent to Egypt to put down the rebellion of 'Obaidallāh ibn as Sarī, where he remained as governor till 827.[27] His brother Muhammad ibn Tāhir was by no means so well disposed towards the Christians, and destroyed all that they had been allowed to build in Edessa.[28] Wherefore the patriarch went down into Egypt to beg the emir 'Abdallāh to write to his brother and bid him moderate his zeal against the church, which he accordingly did.[29] On his return from Egypt the patriarch had troubles with Philoxenus, bishop of Nisibis, who espoused the cause of the anti patriarch Abraham,[30] and he then went to Baghdādh in 829 to confer with the caliph al-Ma'mūn as to an edict that he had issued on the occasion of dissensions between the Palestinian and Babylonian Jews regarding the appointment of an exilarch.[31] During his stay in the capital disputes took place among the Christians, which ended in a reference to the caliph and in the deposition of the bishop Lazarus bar Sābhĕthā.[32] From Baghdādh Dionysius proceeded to Taghrīth and Mosul, and nominated Daniel as maphriān in place of the deceased Basil. In 830 al-Ma'mūn made an attack on the Greek territory, and the patriarch tried to see him on his return at Kaisūm, but the caliph had hurried on to Damascus, whither Dionysius followed him and accompanied him to Egypt on a mission to the Bashmuric Copts, who were then in rebellion. Any efforts of his and of the Egyptian patriarch were, however, of no avail, and the unfortunate rebels suffered the last horrors of war

---

1 *B.O.*, iii. 1, 111-113. By the "theology" of Gregory Nazianzen are probably meant the discourses bearing the title *Theologica Prima*, &c.; see, for example, Wright, *Catal.*, p. 425, Nos. 22-25.

2 Hoffmann, *Auszuge*, p. 227 sq.

3 Also a pupil of Abraham bar Dāshandādh (*B.O.*, iii. 1, 212 note 2, 169, col. 1). He is mentioned in commendatory terms by Timothy in his encyclical letters of 790 and 805 (*B.O.*, iii. 1, 82 col. 1, 164 col. 1; 'Abhd īshō', *Collectio Canonum Synodicorum*, ix. 6, in Mai, *Scriptt. Vett. Nova Coll.*, x. pp. 167 col. 1, 329 col. 1). He was the author of a refutation of the Kor'ān, a disputation against heretics, and other useful works (*B.O.*, iii. 1, 212), among which may be mentioned a life of the missionary John of Dailam (*B.O.*, iii. 1, 183, col. 2).

4 Or, according to others, 777.

5 Hoffmann, *Auszuge*, p. 216 sq.

6 *B.O.*, iii. 1, 207.

7 We need not believe all the evil that Bar Hebræus tells us of this unhappy man, *Chron. Eccles.*, ii. 171 sq.

8 See the whole miserable story told in full in *B.O.*, ii. 433, iii. 1, 158-160; Bar Hebræus, *Chron. Eccles.*, ii. 165-169.

9 Baethgen, *Fragmente*, pp. 64, 131.

10 Bar Hebræus, *Chron. Eccles.*, ii. 169; *B.O.*, ii. 433.

11 *B.O.*, iii. 1, 160. Compare Chwolson's interesting memoir "Syrische Grabinschriften aus Semirjetschie" (west of the Chinese province of Kuldja, more correctly Kulja), in *Mém. de l'Acad. Imp. des Sc. de St Pétersb.*, 7th ser., vol. xxxiv., No. 4. The oldest of these tombstones is dated A. Gr. 1169 = 858 A.D., and marked "the grave of Mengkū tenesh the believer" (p. 7), but most of them belong to the 13th and 14th centuries.

12 See *B.O.*, ii. 434, iii. 1, 160.

13 *B.O.*, iii. 1, 162-163.

14 *Chron. Eccles.*, ii. 179. He is probably the author of the hymn in Brit. Mus. Add. 7156 (Rosen, *Catal.*, p. 13, col. 1, 1) and Paris, Suppl. 56 (Zotenberg, *Catal.*, p. 9, col. 1, 1).

15 See Baethgen, *Fragmente*, p. 2, No. 3; Bar Hebræus, *Chron. Eccles.*, ii. 152 note 2, 154 note 1 (Abbeloos writes "the abbots of the great convent").

16 *B.O.*, iii. 1, 195.

17 Baethgen, *Fragmente*, p. 2.

18 *Chron. Eccles.*, i. 333; *B.O.*, iii. 1, 195, note 4 (where 695 is a mistake for 793). See also Bar Hebræus, *Chron. Eccles.*, ii. 42 note 2, 114 note 1, 122 note 1, 127 note 3, 138 notes 1, 2, 140 note 1.

19 See Hoffmann in *Z.D.M.G.*, xxxii. (1878), p. 742, note 2.

20 Bar Hebræus, *Chron. Eccles.*, i. 347-349.

21 *B.O.*, ii. 345, col. 1, where the rebuilding of it by Dionysius is mentioned; Bar Hebræus, *Chron. Eccles.*, i. 355, at the top.

22 Bar Hebræus, *Chron. Eccles.*, i. 347-349. A previous residence at the convent of Zuknīn near Āmid (*B.O.*, ii. 98, col. 2) is uncertain, as the words *dairā dhīlan* probably mean no more than "the convent of us Jacobites."

at the hands of al Ma'mūn and his general Afshīn[1] On this journey Dionysius saw and examined the obelisks of Heliopolis, the pyramids, and the Nilometer[2] In 835 he revisited Taghrīth to settle some disputes between the Taghrītans and the monks of Mār Matthew at Mosul, and to ordain Thomas as maphriān in place of the deceased Daniel[3] In the same year he went once more to Baghdādh to salute al Ma'mūn's successor al-Mu'tasim, and met there the son of the king of Nubia, who had come on the same errand[4] The latter years of Dionysius were embittered by the oppressions and afflictions which the Christians had to endure at the hands of the Muhammadans He died on 22d August 845, and was buried in the convent of Ken neshrē[5] He left behind him one great work, his *Annals*, covering the whole period of the world's history from the creation down to his own time Of this there were two recensions, a longer and a shorter The longer redaction was dedicated to John, bishop of Dārā and came down at all events to the year 837, or perhaps a little later[6] Assemani has published an extract from it, which he was fortunate enough to find in Cod Vat cxliv, f 89, in the *B O*, ii 72 77[7] It would seem to have been written, after the manner of John of Asia, in a series of chapters dealing with particular topics The shorter redaction is extant in a single imperfect MS, Cod Vat clxii,[8] and is dedicated to George, chorepiscopus of Āmid, Euthalius the abbot (of Zuknīn?), Lazarus the periodeutes, the monk Anastasius, and the rest of the brotherhood It is arranged by successive years, and ended with the year of the Greeks 1087=776 A D[9] The author has adopted a division into four parts Part first extends from the creation to the reign of Constantine Here the chief authority is the *Chronicorum Canonum Liber* of Eusebius, supplemented by some extracts from other Greek sources, such as Eusebius's *Ecclesiastical History* and the *Chronographia* of Julius Africanus With these Dionysius has incorporated matter derived from sundry other works, *e g*, the *Chronicle of Edessa* (see above, p 835), the *Me'ārath Gazzē* or "Cave of Treasures,"[10] Pseudo Callisthenes's *Life of Alexander the Great*, the story of the seven sleepers,[11] and Josephus's *Jewish War* (see above, p 823)[12] The second part of Dionysius's *Chronicle* reaches from Constantine to Theodosius II, and here he principally followed the *Ecclesiastical History* of Socrates (compare Cod Vat cxlv) The third part extends from Theodosius II to Justin II Here Dionysius acknowledges himself chiefly indebted to his countryman John of Asia (see above, p 835), but has also incorporated the short *Chronicle* of Joshua the Stylite (see above, p 832) and the epistle of Simeon of Bēth Arshām on the Himyarite Christians (see above, p 832) The fourth part, coming down to 158 A H =774 775 A D, is his own compilation, partly from such written documents as he could find, partly from the oral statements of aged men, and partly from his own observation Assemani has given an account of the whole work, with an abridgement or excerpt of the fourth part, in the *Bibl Orient*, ii 98-116, but the labours of Dionysius of Tell Mahrē will never be appreciated as they deserve till the appearance of the edition which is now being prepared by Guidi

Theodosius of Edessa Under Dionysius flourished his brother Theodosius, bishop of Edessa, also a student of Greek at Ken-neshrē Bar-Hebræus makes mention of him as accompanying Dionysius to Egypt in 825 826 to complain to 'Abdallāh ibn Tāhir of the wrongs of the Christians[13] At an earlier period (802 803), when only a priest, he translated the homily of Gregory Nazianzen on the miracles of the prophet Elijah,[14] and Bar Hebræus says that he also rendered into Syriac the poems of the same author[15]

Antonius the Rhetorician A friend of his was Antonius, a monk of Taghrīth, surnamed "the Rhetorician"[16] He was the author of a treatise on rhetoric in seven chapters,[17] of a work on the good providence of God in four discourses,[18] and of various encomia, thanksgivings, consolatory epistles,[19] and prayers,[20] in many of which he makes use not merely of metre but also of rime[21]

Lazarus bar Sābhēthā Lazarus bar Sābhēthā, called as bishop Philoxenus and Basil,[22] ruled the see of Baghdādh in the earlier part of the 9th century As mentioned above, he was deposed by Dionysius in 829 He compiled an anaphora or liturgy,[23] and wrote an exposition of the office of baptism[24] The latter may be only part of a larger work on the offices of the church, from which Bar Hebræus may have derived the information regarding the musical services quoted by Assemani, *B O*, i 166

John of Dārā Contemporary with these was John, bishop of Dārā, to whom Dionysius dedicated the larger recension of his history (see above) He compiled a liturgy,[25] and was the author of the following works—a commentary on the two books of Pseudo Dionysius Areopagita *De Hierarchia Cælesti et Ecclesiastica*,[26] four books on the priesthood,[27] four books on the resurrection of the dead,[28] and a treatise on the soul[29]

Nonnus of Nisibis Nonnus was an archdeacon of the Jacobite Church at Nisībis during the first half of this century, the Nestorian bishop Cyprian having allowed the Monophysites to resume possession of the church of St Domitius in 767 (see above, p 844) He is mentioned by Bar-Hebræus as bringing charges against the bishop Philoxenus, who had sided with the anti patriarch Abraham, and was therefore deposed by a synod held at Rās'ain in 827 or 828[30] We know also that he was in prison at Nisibis when he wrote his work against Thomas bishop of Margā and metropolitan of Bēth Garmai, who flourished under the Nestorian catholics Abraham (837 850) and Theodosius (852 858) Besides this controversial treatise in four discourses, Nonnus was the writer of sundry letters of a similar character[31]

Romanus the physician Romanus the physician, a monk of the convent of Kartamīn, was elected patriarch at Āmid in 887, and took the name of Theodosius[32] He died in 896 He was the author of a medical syntagma (*kunnāshā*) of some repute[33] He wrote a commentary on Pseudo Hierotheus, *On the Hidden Mysteries of the House of God*,[34] and dedicated it to Lazarus, bishop of Cyprus[35] The work is divided into five books, the first and second of which he finished at Āmid, before going down to the East, and the third at Samosāta He also compiled a collection of 112 Pythagorean maxims and proverbs, with brief explanations in Syriac and Arabic, addressed to one George[36] A synodical epistle of his is extant in Arabic, written to the Egyptian patriarch Michael III,[37] and a Lenten homily in Arabic[38]

Moses bar Kēphā Moses bar Kēphā was the son of Simeon Kēphā (or Peter) and his wife Maryam The father was from the village of Mashhad al Kohail, on the Tigris opposite al Hadīthah,[39] the mother a native of Balad, in which town their son was born somewhere about 813 He was taught from his early youth by Rabban Cyriacus, abbot of the convent of Mār Sergius on the Tūrā Sahyā, or Dry Mountain, near Balad, and there assumed the monastic garb He was elected bishop of Bēth Remmān (Bārimmā),[40] Bēth Kiyōnāyā,[41] and Mosul,[42] about 863, and took the name of Severus He was also for ten years periodeutes or visitor of the diocese of Taghrīth He died A Gr 1214=903 A D,[43] "aged about ninety years, of which he had been bishop for forty," and was buried in the convent of Mār Sergius His works are numerous He wrote commentaries on the whole Old and New Testaments,[44] which are often cited by Bar-Hebræus in the *Ausar Rāzē* Of these that on the book of

Genesis survives, though imperfect, in Brit. Mus. 17274,[1] and there are extracts from them in Paris, Ancien fonds 35 (Zotenberg, *Catal.*, p. 156), and Bodl. Marsh 101 (P. Smith, *Catal.*, p. 462). The Gospels and Pauline epistles (imperfect) are contained in Brit. Mus. Add. 17274 (Wright, *Catal.*, p. 620), the latter only in Bodl. Or. 703 (P. Smith, *Catal.*, p. 410) and Bodl. Marsh 86 (*ibid.*, p. 418). His treatise on the *Hexaemeron* in five books[2] is preserved to us in the Paris MS. Anc. fonds 120 (Zotenberg, *Catal.*, p. 197), and there are extracts from it in two other MSS. (*ibid.*, pp. 157, 159). The work *De Paradiso*, in three parts, dedicated to his friend Ignatius of ܦܪܕܝܣܐ (?),[3] is known to us only through the Latin translation of Andreas Masius, 1569.[4] The treatise on the soul[5] survives in Cod. Vat. cxlvii (*Catal.*, iii. 273-274); it consists of 40 chapters, with a supplementary chapter to show that the dead are profited by offerings made on their behalf. That on predestination and freewill, in four discourses, is extant in Brit. Mus. Add. 14731 (Wright, *Catal.*, p. 853). The *Disputations against Heresies*, spoken of by Moses's biographer in *B. O.*, ii. 218, col. 2, is probably identical with the work *On Sects* mentioned by Assemani at p. 131, No. 7. The *Festal Homilies* for the whole year[6] is extant in several MSS., *e.g.*, Brit. Mus. Add. 21210 (Wright, *Catal.*, p. 877) and 17188 (*ibid.*, p. 621), Paris, Anc. fonds 35 and 123 (Zotenberg, *Catal.*, pp. 156, 159).[7] Besides these we have four funeral sermons,[8] an admonitory discourse to the children of the holy orthodox church,[9] and a discourse showing why the Messiah is called by various epithets and names.[10] Moses also wrote expositions of the sacraments of the church, such as on the holy chrism, in 50 chapters, Cod. Vat. cxlvii (*Catal.*, iii. 274) and Paris, Anc. fonds 123 (Zotenberg, *Catal.*, p. 159),[11] with which is connected the discourse on the consecration of the chrism in Brit. Mus. Add. 21210 (Wright, *Catal.*, p. 879), on baptism, addressed to his friend Ignatius, in 24 chapters, Cod. Vat. cxlvii (*Catal.*, iii. 276), in connexion with which we may take the discourse on the mysteries of baptism in Brit. Mus. Add. 21210 (Wright, *loc. cit.*) and on baptism in Cod. Vat. xcvi (*Catal.*, ii. 522),[12] exposition of the liturgy, Brit. Mus. Add. 21210 (Wright, *Catal.*, p. 879) and Berlin, Sachau 62 (?), further, expositions of the mysteries in the various ordinations, Cod. Vat. li (*Catal.*, ii. 320),[13] on the ordination of bishops, priests, and deacons, Brit. Mus. Add. 21210 (Wright, *Catal.*, p. 879), on the tonsure of monks,[14] Cod. Vat. li (*Catal.*, ii. 322).[15] He also compiled two anaphoræ,[16] one of which has been translated by Renaudot, ii. 391. Lastly, Moses bar Kēphā was the author of a commentary on the dialectics of Aristotle, mentioned by Bar-Hebræus in *Chron. Eccles.*, ii. 215, and of a commentary on the works of Gregory Nazianzen, and an ecclesiastical history, mentioned by his biographer in *B. O.*, ii. 218, col. 2. The loss of this last book is to be regretted.

The contemporary Nestorian writers of mark are hardly more numerous.

Honain ibn Ishāk. In this century the foundations of Syriac lexicography were laid by the famous physician Abū Zaid Honain ibn Ishāk al-'Ibādī of Hērtā (al-Hīrah).[17] He applied himself to medicine at Baghdādh, under Yahyā, or Yuhannā, ibn Māsawaih (Māsūyah or Mesue), but an ill feeling soon sprang up between teacher and pupil, and Honain took his departure for the Grecian territory, where he spent a couple of years in acquainting himself with the Greek language and its scientific literature. He afterwards became physician to the caliph al-Mutawakkil. His downfall and excommunication were meanly brought about by a fellow-Christian of the same profession, Isrā'īl ibn at-Taifūrī, and Honain died soon after, 260 A.H. = 873 A.D.[18] Honain composed most of his original works in Arabic, and likewise many of his translations from the Greek. 'Abhd-īshō' mentions but three books of his,[19] viz., a book on the fear of God (which he wrote as a deacon of the church), a Syriac grammar, and a compendious Syriac lexicon. The lexicon has no doubt been in great part absorbed into the later works of Bar 'Alī and Bar Bahlūl.[20] The grammar seems to have been entitled *Kĕthābhā dhĕ Nukzē*, or the "Book of (Diacritical) Points." It is cited by Bar-Hebræus in the *Auşar Rāzē*[21] and by Elias of Tīrhān in his grammar.[22] Honain also wrote a treatise *On Synonyms*, whether they be "voces equilitteræ" (as *rĕghīz* and *raggīz*) or not (as *'ālĕthā* and *karyūthā*). Extracts from this work have been preserved to us by a later compiler, who made use also of the canons of 'Ānān-īshō' of Hĕdhaiyabh[23] (see above, p. 843). In Cod. Vat. cxcvii (*Catal.*, iii. 504) there are excerpts from a medical treatise of Honain, but no title is given.[24] Honain, his son Ishāk, and his nephew Hobaish ibn al-Hasan al-A'sam ("Stiff wrist") were among the earliest and ablest of those Christians, chiefly Nestorians, who, during the 9th and 10th centuries, making Baghdādh their headquarters, supplied Muhammadan scholars with nearly everything that they knew of Greek science, whether medicine, mathematics, or philosophy. As a rule, they translated the Greek first into Syriac and afterwards into Arabic, but their Syriac versions have unfortunately, as it would appear, perished, without exception.[25]

Gabriel bar Bōkht-īshō'. An elder contemporary of Honain was Gabriel bar Bōkht-īshō', Gabriel in Arabic Jabra'īl ibn Bakhtīshū' (or rather Bokhtīshū'), a member of a family of renowned physicians, beginning with George bar Bōkht-īshō' of Gundē-Shābhōr, whom we have mentioned above (p. 844). He was in practice at Baghdādh in 791, and attended on Ja'far ibn Yahyā al-Barmakī, became court physician to ar-Rashīd, and maintained this position, with various vicissitudes, till his death in 828.[26] 'Abhd-īshō' says that he was the author of a Syriac lexicon,[27] which is our reason for giving him a place here, but no such work is mentioned by the other authorities to whom we have referred.[28]

Marūzāyā. Of Īshō' Marūzāyā, in Arabic 'Īsā al-Marwazī, from the city of Marū or Merv, little is known to us beyond the fact that he compiled a Syriac lexicon, which was one of the two principal authorities made use of by Bar 'Alī.[29] That he should be identical with the physician al-Marwazī, who lived about 567,[30] seems wholly unlikely. We might rather venture to identify him with Abū Yahyā al-Marwazī, who was an eminent Syrian physician at Baghdādh, wrote in Syriac upon logic and other subjects, and was one of the teachers of Mattā ibn Yaunān or Yūnus (who died in 940).[31] In any case, 'Īsā al-Marwazī seems to have flourished during the latter part of the 9th century, and therefore to have been a contemporary of Bar 'Alī.

Bar 'Alī. Īshō', or 'Īsā, bar 'Alī is stated in Cod. Vat. cxcvii (*Catal.*, iii. 504, No. xv.) to have been a pupil of Honain. His father 'Alī and his uncle 'Īsā, the sons of Dā'ūd or David, were appointed by the catholicus Sabhr-īshō' II. (832-836) to the charge of the college founded by him in the convent of Mār Pethīōn at Baghdādh.[32] Bar 'Alī's lexicon is dedicated to a deacon named Abraham,[33] who made certain additions to it after the death of the author.[34]

Īshō' bar Nōn. Īshō' bar Nōn was a native of the village of Bēth-Gabbārē near Mosul. He was a pupil of Abraham bar Dāshandādh (see above, p. 844) at the same time with Abū Nūh al-Anbārī (see above, p. 845, note 3) and Timothy, his predecessor in the dignity of catholicus (see above, p. 845). He retired first to the convent of Mār Abraham on Mount Izlā, where he devoted himself to study and to refuting the views and writings of his schoolfellow and subsequent diocesan Timothy, whom he spitefully called *Tālēm-otheos* ("the wronger of God") instead of *Timotheos*. In consequence of a dispute with the monks he left Mount Izlā and went for some months to Baghdādh, where he stayed at the house of George Māsawaih (Māsūyah or Mesue) and taught his son Yahyā.[35] He then returned to Mosul, where he took up his residence in the convent of Mār Elias, and lived there for thirty years, till the death of Timothy.[36] Through the influence of Gabriel bar Bōkht-īshō' (see above) and his son-in-law Michael bar Māsawaih (Māsūyah or Mesue), the physician of the caliph al-Ma'mūn, he was appointed catholicus A. 24 Cod. Vat. cxcii. (*Catal.*, iii. 409), *Syntagma Medicum Syr. et Arab.*, is not likely to be his, but requires closer examination.
25 This is a large subject, into which we cannot here enter, the more so as it pertains rather to a history of Arabic than of Syriac literature. We would refer the reader to Wüstenfeld, *Geschichte d. arab. Aerzte u. Naturforscher*, 1840; Flügel, *Dissert. de Arabicis Scriptorum Græcorum Interpretibus*, 1841; Wenrich, *De Auctorum Græcorum Versionibus et Commentariis*, 1842; Renan, *De Philosophia Peripatetica apud Syros*, 1852, sect. viii. p. 51; *Al-Farabi (Alpharabius) des Arab. Philosophen Leben u. Schriften*, by M. Steinschneider, 1869; A. Müller, *Die Griechischen Philosophen in der arabischen Ueberlieferung*, 1873. Of Muhammadan authorities two of the most important are the *Fihrist* of Abu 'l-Faraj Muhammad ibn Ishāk al-Warrāk al-Baghdādhī, commonly called Ibn Abī Ya'kūb an-Nadīm (died early in the 11th century), and the *'Uyūn al-Anbā fī Tabakāt al-Atibbā* of Muwaffak ad-Dīn Abū 'l-'Abbās Ahmad ibn al-Kāsim as-Sa'dī al-Khazrajī, generally known by the name of Ibn Abī Usaibi'ah (died in 1269). The former work has been edited by Flügel, J. Rödiger, and A. Müller, 1871-72, the latter by A. Müller, 1884.

36 So Assemani, *B. O.*, ii. 435. Bar-Hebræus (*Chron. Eccles.*, ii. 181) says that he resided for thirty-eight years in the convent of Sa'īd near Mosul.

=823-824 A D[1] He sat for only four years, and was buried, like his predecessor, in the convent of Kĕlīl-ishō' at Baghdādh Of his ill feeling towards Timothy I we have already made mention, how he kept it up after Timothy's death, and what troubles he got into in consequence, may be read in the pages of Assemani (*B O*, iii 1, 165) Bar-Hebræus has preserved some account of a disputation between him and a Monophysite priest named Pāpā[2] 'Abhd-ishō' gives the following list of his works[3]—a treatise on theology, questions on the whole text of Scripture, in two volumes, a collection of ecclesiastical canons and decisions,[4] consolatory discourses, epistles, a treatise on the division of the services, *turgāmē* or "interpretations,"[5] and a tract on the efficacy of hymns and anthems Of the questions on Scripture there is a copy in the collection of the S P C K, and of the consolatory discourses a mutilated MS in the British Museum, Add 17217 (Wright, *Catal*, p 613)[6] The replies to the questions of Macarius the monk seem to belong to the treatise on the division of the services (*purrāsh teshmĕshāthā*), if one may judge by the first and only one quoted[7]

Denhā A disciple of Īshō' bar Nōn was Denhā, or, as he is otherwise called in some MSS of 'Abhd ishō''s *Catalogue*, Īhibhā (or rather Hibhā, Ibas)[8] Assemani places him under the catholicus Pethiōn (died in 740), but we prefer to follow the authority of John bar Zō'bī in his *Grammar*[9] Denhā was the author of sermons and tracts on points of ecclesiastical law, and of commentaries on the Psalms, on the works of Gregory Nazianzen (as contained in two vols in the translation of the abbot Paul), and on the dialectics of Aristotle

Thomas of Margā In 217 A H =832 A D, the same year in which Sabhr ishō' II succeeded to the patriarchate,[10] a young man named Thomas, the son of one Jacob of Bēth Sherwānāyē, in the district of Salakh,[11] entered the convent of Bēth 'Ābhē, which seems at this time to have fallen off sadly in respect of the learning of its inmates[12] A few years afterwards (222 A H =837 A D) we find him acting as secretary to the patriarch Abraham (also a monk of Bēth 'Ābhē, who sat from 837 to 850)[13] By him he was promoted to be bishop of Margā, and afterwards metropolitan of Bēth Garmai, in which capacity he was present at the ordination of his own brother Theodosius (bishop of al-Anbār, afterwards metropolitan of Gundē Shābhōr) as catholicus in 852[14] Thomas of Margā (as he is commonly called), having been very fond from his youth of the legends and histories of holy men, more especially of those connected with his own convent of Bēth 'Ābhē, undertook to commit them to writing at the urgent request of the monk 'Abhd ishō', to whom he dedicates the *Monastic History* Assemani has given a tolerably full analysis of this work, with a few extracts, in the *B O*, iii 1, 464 501, throughout which volume it is one of his chief authorities The publication of it in a complete form is much to be desired The MSS available in Europe are—Cod Vat clxv (*Catal*, iii 331), of which Codd Vatt ccclxxxi ii are a copy (Mai, *Scriptt Vett Nova Coll*, v), Paris, No 286 in Zotenberg's *Catal*, p 216 (also copied from Vat clxv), Brit Mus Orient 2316 (ff 182, 17th century, imperfect), Berlin, Sachau 179 (copied in 1882) Thomas also wrote a poem in twelve syllable metre on the life and deeds of Māran 'ammēh metropolitan of Hĕdhaiyabh, which he introduced into his *History*, bk iii ch 10, see *B O*, iii 1, 485

Īshō'-dādh of Merv Īshō' dādh of Marū or Merv, bishop of Hĕdhattā or al-Hadīthah, was a competitor with Theodosius for the patriarchate in 852[15] According to 'Abhd-ishō', his principal work was a commentary on the New Testament, of which there are MSS in Berlin, Sachau 311, and in the collection of the S P C K It extended, however, to the Old Testament as well, for in Cod Vat ccclvii we find the portions relating to Genesis and Exodus[16]

Kendī In the *B O*, iii 1, 213, 'Abhd ishō' names a certain Kendī as the author of a lengthy disputation on the faith[17] Assemani places this "Candius" or "Ebn Canda" under the catholicus John IV, apparently on the authority of 'Amr ibn Mattā We suspect, however, that the person meant is 'Abd al-Masīh (Ya'kūb) ibn Ishāk al-Kindī, the author of a well known apology for the Christian religion, which has been published by the Society for Promoting Christian Knowledge[18] The work dates from the time of the caliph al-Ma'mūn (813 833), and therefore synchronizes with the disputations of Theodore Abū Korrah, bishop of Harrān[19] Being written in Arabic, it hardly belongs to this place, but is mentioned to avoid misapprehension

Theodore bar Khōnī Theodore bar Khōnī is stated to have been promoted by his uncle John IV to the bishopric of Lāshōm in 893[20] He was the author of scholia (on the Scriptures), an ecclesiastical history, and some minor works

Aḥiōn To about this period probably belongs another historian, the loss of whose work we have to regret This is a writer named Ahiōn or Aaron, who is mentioned by Elias bar Shīnāyā under 273 A H = 886 887 A D[21]

Jacobite authors of 10th century In the 10th century the tale of Jacobite authors dwindles away to almost nothing Most of the dignitaries of the church composed their synodical epistles and other official writings in Arabic, and the same may be said of the men of science, such as Abū 'Alī 'Īsā ibn Ishāk ibn Zur'ah (943 1008) and Abū Zakariyā Yahyā ibn 'Adī, who died in 974 at the age of eighty-one

Simeon, the deacon About the middle of the century we may venture to place the deacon Simeon, whose *Chronicle* is cited by Elias bar Shīnāyā under 6 A H =627-628 A D and 310=922 923[22] The 11th century is somewhat more prolific

A Persian Christian named Gīsā,[23] leaving his native city of Ushnūkh or Ushnū in Ādharbāigān, settled, after several removals, in the district of Gūbōs or Gūbās,[24] one of the seven dioceses of the province of Melitēne (Malatiah), and built there a humble church, in which he deposited sundry relics of St Sergius and St Bacchus, and cells for himself and his three companions This happened in 958[25]

John of Māiōn As the place grew in importance, other monks gradually resorted to it, and among them "Mār(ī) Yōhannān dĕ-Māiōn," or John (the son) of Māiōn[26] a man of learning in both sacred and profane literature, who had studied under Mār Mĕkīm at Edessa Gīsā, the founder of the convent, died at the end of twelve years, and was succeeded as abbot by his disciple Elias, who beautified the church Meantime its fame increased as a seat of learning under the direction of John of Māiōn, and many scribes found employment there The patriarch John VII, *da sĕrighta*, "He of the Mat" (his only article of furniture),[27] was one of its visitors Elias, on his retirement, nominated John of Māiōn as his successor, who, aided by the munificence of Emmanuel, a monk of Harrān and a disciple of the maphriān Cyriacus,[28] rebuilt the church on a larger and finer scale, whilst a constant supply of fresh water was provided at the cost of a Taghritan merchant named Mārūthā This was in 1001 About this time Elias bar Gāghai, a monk of Taghrīth, founded a monastery near Melitēne, but died before it was finished His work was taken up by one Eutychius or Kulaib, who persuaded John of Māiōn to join him Here again his teaching attracted numbers of pupils At last, after the lapse of twelve years, when there were 120 priests in the convent, he suddenly withdrew by night from the scene of his labours and retired to the monastery of Mār Aaron near Edessa, where he died at the end of four years, about 1017 His commentary on the book of Wisdom is cited by Bar Hebræus in the *Ausar Rāzē*[29]

Mark bar Kīkī Mark bar Kīkī was archdeacon of the Taghritan church at Mosul, and was raised to the dignity of maphriān by the name of Ignatius in 991[30] After holding this office for twenty-five years, he became a Muhammadan in 1016,[31] but recanted before his death, which took place at an advanced age[32] in great poverty He composed a poem on his own fall, misery, and subsequent repentance, of which Bar Hebræus has preserved a few lines[33]

Joseph of Melitene According to Assemani, *B O*, ii 317 and cl, Bar Hebræus mentions in his *Chronicle* that a monk named Joseph wrote three discourses on the cruel murder of Peter the deacon by the Turks at Melitēne in 1058 The anecdote may be found in the edition of Bruns and Kirsch, p 252 (transl, p 258), but the discourses would seem rather to have dealt with the retribution that overtook the retiring Turks at the hands of the Armenians and the wintry weather

Yēshū' bar Shūshan Yēshū' bar Shūshan (or Susanna), syncellus of Theodore or John IX, was chosen patriarch by the eastern bishops, under the name of John X, in opposition to Hāyē or Athanasius VI, on whom the choice of their western brethren had fallen in 1058[34] He soon abdicated, however, retired to a convent, and devoted himself to study

On the death of Athanasius he was reelected patriarch in 1064, and sat till 1073.[1] He carried on a controversy with the patriarch of Alexandria, Christodūlus, regarding the mixing of salt and oil with the Eucharistic bread according to the Syrian practice.[2] He compiled an anaphora, issued a collection of twenty four canons,[3] and wrote many epistles,[4] chiefly controversial. Such are the letters in Arabic to Christodūlus on the oil and salt[5] and the letter to the catholicus of the Armenians.[6] The tract on the oil and salt is extant in Paris, Anc. fonds 54 (Zotenberg, *Catal.*, p. 71), and there is an extract from it in Suppl. 32 (Zotenberg, *Catal.*, p. 54). Bar Shūshān also wrote four poems on the sack of Melitēne by the Turks in 1058,[7] and collected and arranged the works of Ephraim and Isaac of Antioch, which he had begun to write out with his own hand when he was interrupted by death.[8]

Sa'īd bar Ṣābūnī

Sa'īd bar Ṣābūnī lived during the latter part of the 11th century. He was versed in Greek as well as Syriac, and well known as a literary man,[9] especially as a writer of hymns.[10] The patriarch Athanasius VII Abū 'l Faraj bar Khammārē (1091-1129) raised him to the office of bishop of Melitēne (Malatiah) in October 1094. His consecration took place at Kankĕrath, near Āmid, by the name of John, and he set out for Malatiah, which he entered on the very day that the gates were closed to keep out the Turks, who laid siege to it under Kilij Arslān (Dā'ūd ibn Sulaimān), sultān of Iconium. He was murdered during the course of the siege, in July 1095, by the Greek commandant Gabriel.[11]

The Nestorian writers of these two centuries are both more numerous and more important than the Jacobite.

Bar Saroshwai

We may place at the head of our list the name of Ḥĕnān Īshō' bar Saroshwai, who must have lived quite early in the 10th century, as he is cited by Elias of Anbār, who wrote about 922.[12] He was bishop of Ḥērtā (al Ḥīrah), and published questions on the text of Scripture and a vocabulary with glosses or explanations,[13] which is constantly cited by his successor in this department of scholarship, Bar Bahlūl.[14]

Bar Bahlūl

With Bar Saroshwai we naturally connect Īshō' bar Bahlūl, in Arabic Abū 'l Ḥasan 'Īsā ibn al Bahlūl, the fullest and most valuable of Syriac lexicographers. His date is fixed by that of the election of the catholicus 'Abhd īshō' I, in which he bore a part, in 963.[15]

Abhzūdh

'Abhd-īshō' in his *Catalogue*, *B O*, iii 1, 261, mentions an author Abhzūdh, a teacher in some school or college (*eskōlāyā*), who composed a treatise containing demonstrations on various topics, alphabetically arranged and dedicated to his friend Kurtā.[16] In note 5 Assemani makes the very circumstantial statement, but without giving his authority, that Abhzūdh was head of the college founded at Baghdādh about 832 by Sabhr īshō' II,[17] under Sergius (860-872). But, if this writer be identical, as seems probable, with the Bazūdh who was the author of a *Book of Definitions* described at some length by Hoffmann, *De Hermeneuticis apud Syros Aristoteleis*, pp 151-153, we must place him nearly a century later, because he cites the "scholia" of Theodore bar Khōnī, who was appointed bishop of Lāshōm in 893.[18] The whole matter is, however, very obscure, and Hoffmann has subsequently (*Opusc. Nestor.*, p xxii) sought to identify Bazūdh, who was also called Michael (*ibid.*, p xxi), with the Michael who is mentioned as a commentator on the Scriptures by 'Abhd īshō', *B O*, iii 1, 117, and whom Assemani supposed to be the same as Michael bishop of al Ahwāz (died in 852 or 854).[19] All then that appears to be certain is that the Persian Bazūdh also bore the Christian name of Michael, and that, besides the alphabetically arranged demonstrations and the *Book of Definitions*, he composed a tract on man as the microcosm.[20]

Elias of al-Anbār

Elias, bishop of Pērōz Shābhōr or al Anbār, flourished about 922, as appears from his disputes with the catholicus Abraham (905-937),[21] and his account of the miserable bishop Theodore of Bēth Garmai, who, after his deposition by John bar Ḥĕghīrē (900-905) and subsequent absolution by Abraham, became a Muhammadan.[22] He was the author of a collection of metrical discourses in three volumes,[23] an apology, epistles, and homilies.[24]

George of Mosul

George, metropolitan of Mosul and Arbēl, was promoted to this dignity by the catholicus Emmanuel about 945, and died after 987. He contested the patriarchate three times but in vain, viz.,—in 961, and when Isrā'ēl was elected,[25] in 963, when 'Abhd īshō' I was the successful candidate,[26] and in 987, when the choice of the synod fell on Mārī bar Ṭōbī.[27] His chief work was an exposition of the ecclesiastical offices for the whole year, in seven sections, of which Assemani has given a full analysis in *B O*, iii 1, 518-540.[28] Some specimens of his *turgāmē* or hymns may be found in Codd. Vatt. xc and xci (*Catal.*, ii 487, No 27, and 490, No 24), and Berlin, Sachau 167, 2.

Emmanuel bar Shahhārē

The date of Emmanuel bar Shahhārē[29] is fixed by his presence at the consecration of 'Abhd īshō' I in 963.[30] He was teacher in the school of Mār Gabriel in the convent called the Dairā 'Ellāitā at Mosul. Cardāhī places his death in 980.[31] Besides some minor expository treatises, he wrote a huge work on the *Hexaemeron* or six days of creation.[32] The Vatican MS[33] contains twenty eight discourses, of which the second is wanting, and a twenty ninth is added *On Baptism*. It is dated 1707. The MS in the Brit. Mus., Orient 1300, dated 1685, also contains twenty-eight discourses, of which the second is wanting.[34] Some of them are in seven-syllable, others in twelve-syllable metre.[35] Cardāhī has published a specimen in his *Liber Thesauri*, pp 68-71. Emmanuel's brother, 'Abhd-īshō' bar Shahhārē, is mentioned by Assemani, *B O*, iii 540, and by Cardāhī. The latter has printed part of one of his poems, on Michael of Āmid, a companion of Mār Eugenius, in *Liber Thesauri*, pp 136-137. It is taken from Cod. Vat. clxxxiv (*Catal.*, iii 395). But there the author is called Bar Shi'ārah, ܒܪ ܫܥܪܐ, and is said to have been a monk of the convent of Michael (at Mosul).

Andrew

Somewhere about the end of this century we may venture to place a writer named Andrew, to whom 'Abhd īshō' has given a place in his *Catalogue*, and whom Assemani has chosen to identify with the well known Andrew, bishop of Samosāṭa, the opponent of Cyril of Alexandria.[36] The words of 'Abhd īshō', if we understand them rightly, mean that this Andrew wrote *turgāmē* (or hymns of a particular kind) and a work on *puḥḥām sĕyāmē*, the placing of the diacritical and vowel points and marks of interpunction.[37] He was therefore an inoffensive grammarian.

Elias I., catholicus

Elias, the first Nestorian catholicus of the name, was a native of Karkhā dhĕ Gheddān,[38] was trained in Baghdādh and al-Madāin, and became bishop of Ṭīrhān, whence he was advanced to the primacy in 1028, and sat till 1049.[39] According to 'Abhd īshō', he compiled canons and ecclesiastical decisions, and composed grammatical tracts.[40] According to Mārī ibn Sulaimān,[41] he was the author of a work on the principles of religion in twenty two chapters, which may be identical with the second of the above, and of a form of consecration of the altar (*kuddās al madhbah*). His *Grammar* was composed in his younger days, before he became bishop. It has been edited and translated from a MS at Berlin[42] by Baethgen.[43] A tract of his on the diacritical points and marks of interpunction is cited and used by John bar Zō'bī.[44]

Bar Bahrīz

Abū Sa'īd 'Abhd īshō' bar Bahrīz was abbot of the convent of 'Abhd Elias or Sa'īd at Mosul, and a candidate for the patriarchate when īshō' bar Elias I was elected in 1028. He was subsequently promoted to be metropolitan of Āthōr or Mosul.[45] He collected ecclesiastical canons and decisions,[46] wrote on the law of inheritance,[47] and an exposition of the offices of the church.

Daniel of Tahal

Assemani has assigned the same date to Daniel (the son) of Tūbhānīthā, bishop of Tahal in Bēth Garmai, but without any sufficient reason.[48] If he be really identical with the Daniel to

48 That he follows 'Abhd īshō' bar Bahrīz in the *Catalogue* of 'Abhd īshō' is no evidence whatever as to his date, and the work mentioned in *B O*, iii 1, 174, notes 3 and 4, is not by Bar Bahrīz, but by George of Mosul and Arbēl (see Cod. Vat. cliii).

whom George, metropolitan of Mosul and Arbēl, dedicated his exposition of the offices of the church, he must have lived about the middle of the previous century. He wrote funeral sermons, metrical homilies, answers to Scriptural questions and enigmas, and other stuff of the same sort. More important probably were his "Book of Flowers," *Kĕthābhā dhĕ Habbābhē*, which may have been a poetical florilegium; his *Solution of the Questions in the Fifth Volume of Isaac of Nineveh's Works*; and his commentary on the *Heads of Knowledge* or maxims (of Evagrius).[1]

Elias bar Shīnāyā

Conspicuous among the writers of this century is Elias bar Shīnāyā, who was born in 975,[2] adopted the monastic life in the convent of Michael at Mosul under the abbot John the Lame,[3] and was ordained priest by Nathaniel, bishop of Shennā (as Sinn), who afterwards became catholicus under the name of John V (1001-12).[4] Elias was subsequently in the convent of Simeon on the Tigris opposite Shennā, and was made bishop of Bēth Nuhādhrē in 1002.[5] At the end of 1008 he was advanced to the dignity of metropolitan of Nisibis.[6] With the next patriarch, John VI bar Nāzōk (1012-20),[7] previously bishop of Hērtā, he was on good terms; but he set his face against Īshō'-yabh bar Ezekiel (1020-25).[8] Under Elias I (1028-49) all seems to have been quiet again. That our author survived this patriarch is clear from his own words in *B. O.*, iii. 1, 268, col. 2, ll. 19, 20.[9] His greatest work is the *Annals* or *Chronicle*, of which unfortunately only one imperfect copy exists.[10] Baethgen has published extracts from it under the title of *Fragmente syr. u. arab. Historiker*, 1884, which have enabled scholars to recognize its real importance.[11] The exact date of the *Annals*, and probably of the writing of the unique copy, is fixed by the statement of the author, f. 15b, that John, bishop of Hērtā, was ordained catholicus on Wednesday, 19th of the latter Teshrīn, A. Gr. 1324 (19th November 1012 A.D.), and that he still ruled the Nestorian Church "down to this year in which this work was composed, namely, A. Gr. 1330" (1018-19).[12] After the *Annals* we may mention Elias's Syriac grammar, one of the best of the Nestorian writings on the subject,[13] and his Arabic-Syriac vocabulary, *Kitāb at-Tarjumān fī ta'līm lughat as-Suryān*, or "the Interpreter, to teach the Syriac Language." It has been edited by De Lagarde in his *Praetermissorum Libri Duo*, 1879, and was the storehouse from which Thomas à Novaria derived his *Thesaurus Arabico-Syro-Latinus*, 1636. Elias was also a composer of hymns, some of which occur in the Nestorian service-books,[14] and of metrical homilies, apparently of an artificial character.[15] He edited four volumes of decisions in ecclesiastical law, which are often cited by 'Abhd-īshō' of Nisibis in his *Collectio Canonum Synodicorum*[16]; indeed the third section, "On the Division of Inheritances," is entirely borrowed from the work of Elias.[17] Of his epistles that to the bishops and people of Baghdādh on the illegal ordination of Īshō'-yabh bar Ezekiel is preserved in Cod. Vat. cxxix (*Catal.*, iii. 191).[18] Six of his Arabic dissertations have been described by Assemani in the *B. O.*, iii. 1, 270-272. The most important of them appears to be No. 5, a disputation, in seven sessions or chapters, with the vizīr Abu 'l-Kāsim al-Husain ibn 'Alī al-Maghribī, preceded by a letter to the secretary Abu 'l-'Alā Sā'id ibn Sahl. These meetings took place in 1026, and the work was committed to writing in 1027, after the death of the vizīr at Maiyāfārikīn in October, and published with the approbation of the celebrated commentator, philosopher, and lawyer Abu 'l-Faraj 'Abdallāh ibn at-Taiyib,[19] who was secretary to the patriarch Elias I. The anonymous work described in full by Assemani (*B. O.*, iii. 1, 303-306) under the title of *Kitābu 'l-Burhān 'alā sahīhi* (or rather *fī tashīhi*) *'l-īmān*, "The Demonstration of the Truth of the Faith," is also by him.[20]

Anonymous translations

Here we may pause in our enumeration to cast an eye upon some anonymous translations, which we are inclined to ascribe to the 10th and 11th centuries, and which are interesting as showing what the popular literature of the Syrians was, compared with that of their theologians and men of science.

Kalīlah wa-Dimnah

We have already spoken of the older translation of *Kalīlagh wĕ-Damnagh*, made by the periodeutes Bōdh in the 6th century of our era (see above, p. 837). About the middle of the 8th century there appeared an independent Arabic translation from the Pahlavī by 'Abdallāh ibn al-Mukaffa', which, under the name of *Kalīlah wa-Dimnah*, has been the parent of secondary versions in the Syriac, Persian, Greek, Hebrew, and Spanish languages.[21] The Syriac version was discovered by the present writer in a unique MS. in the library of Trinity College, Dublin, and published by him in 1884.[22] It is evidently the work of a Christian priest, living at a time when the condition of the Syrian Church was one of great degradation, and the power of the caliphate on the wane, so that the state of society was that of complete disorder and licentiousness,[23] a description which would very well apply to the 10th or 11th century. Indeed we could not place it much later, because part of the unique MS. goes back to the 13th century, and even its text is very corrupt, showing that it had passed through the hands of several generations of scribes. "The chief value of this later Syriac version is that it sheds light on the original text of the Arabic K. w. D. The Arabic text which the Syriac translator had before him must have been a better one than De Sacy's, because numbers of Guidi's extracts,[24] which are not found at all in De Sacy's text, appear in their proper places in the later Syriac."[25]

Sindbān

To about the same period, judging by the similarity of style and language, we would assign the Syriac version of the book of *Sindibādh*. This work was translated, probably in the latter half of the 8th century, from Pahlavī into Arabic by Mūsā, a Muhammadan Persian. It is, as Nöldeke has shown,[26] the smaller of the two recensions known to the Arabs, the larger, entitled *Aslam* (?) *and Sindibādh*, being the work of al-Asbagh ibn 'Abd al-'Azīz as-Sijistānī. The smaller *Sindibādh* was in its turn done into Syriac, and thence into Greek by Michael Andreopūlus for Gabriel, prince of Melitēnē (1086-1100), as discovered by Comparetti,[27] under the name of Συντίπας (Sindipas), just as *Kalīlah wa-Dimnah* was translated by Symeon (the son of) Seth for the emperor Alexius Comnenus, who ascended the throne in 1081. The Syriac version, which bears the title of the *Story of Sindbān and the Philosophers who were with him*, has been edited by Baethgen, with a German translation and notes, from the unique MS. in the Royal Library at Berlin.[28]

Life of Alexander the Great

A third product of the same age we believe to be the Syriac translation of Pseudo-Callisthenes's *Life of Alexander the Great*, made from an Arabic version of a Greek original. Of this, however, we shall be better able to judge when the Syriac text lies before us in print.[29]

Æsop's Fables

Lastly, we would place somewhere between the 9th and 11th centuries the Syriac translation of Esop's (Æsop's) *Fables*, which has been edited under a somewhat Jewish garb by Landsberger,[30] who imagined himself to have found the Syriac original of the fables of Syntipas (Sindipas), whereas Geiger[31] clearly showed that we have here to do with a Syriac rendering of one of the forms of the fables of Esop. In fact, as Geiger pointed out, דסופוס is only a clerical error for דאסופוס. In Syriac MSS. of this collection the title is written ܕܝܘܣܝܦܘܣ, "of Josephus."[32] In some close relation to these stands the story of Josephus and king Nebuchadnezzar in the Berlin MS. Alt Bestand 57, ff. 16-57, with which are interwoven a number of Esopic fables. They have been edited (with the exception of two) by Rödiger in his *Chrestom. Syr.*, 2d ed., pp. 97-100.

Resuming our enumeration of Syrian writers, we find that in the 12th century the number of them, whether Jacobite or Nestorian, is small, but two of the former sect are men of real mark.

Abū Ghālib bar Sābūnī

Abū Ghālib bar Sābūnī, the younger brother of Sa'īd bar Sābūnī (see above, p. 819), was almost as unfortunate as his brother. He was raised to the episcopate of Edessa after his brother's death by Athanasius VII, but speedily deposed on account of a quarrel, although many of the Edessenes, among them the governor Bald-

---

32 *B. O.*, iii. 1, 7, with note 2. So, for example, MS. Trin. Coll. Dublin, B. 5, 32 (Wright, *Kalīlah and Dimnah*, pp. ix., x.).

win, brother of Godfrey of Bouillon, took his part. He died of a fall from his horse, shortly after the death of the patriarch in 1129.[1] Though a good scholar and linguist, he does not appear to have written anything that has come down to our times. Assemani, it is true, ascribes to him three poems in twelve-syllable metre on the capture of Edessa by Zengī ibn Āk-sunkur, but, as this took place in 1144,[2] the writer must have been his successor, Basil bar Shumnā (1143-69).[3]

John of Harrān and Mārdīn.

John,[4] bishop of Harrān and Mardē or Mārdīn, had charge of the Jacobite churches in the East, his diocese including Tell Besmē, Kĕphar-tūthā, Dārā, Nisibis, Rās'ain, and the Khābhōrā or Khābūr. He was originally a monk of Edessa, was appointed bishop by Athanasius VII in 1125, and was killed by a fall from his horse in 1165, at the age of seventy-eight.[5] He devoted himself chiefly to the restoration of the decayed churches and monasteries of his diocese, as may be seen from the autobiographical fragment in *B. O.*, ii. 217 *sq.* From the same document, pp. 224-225, it appears that he was fond of MSS., which he collected, repaired, and bound, and that he wrote with his own hand four small copies of the Gospels in gold and silver. He enjoyed a well-earned reputation as a land-surveyor and practical engineer.[6] Bar-Hebræus notes his great liberality in redeeming the captive Edessenes who had been carried off by Zengī's troops.[7] The fall of Edessa (1144), however, was an event that got him into a great deal of trouble. He was ill advised enough to write a treatise on the Providence of God, in which he maintained that chastisements of that kind were *not* sent upon men by God, and that, if the troops of the Franks (Crusaders) had been there, Edessa would not have been taken by Zengī. Such rank heresy of course brought down upon him the whole bench of bishops. He was attacked by the priest Salībhā of Kaigānah (?),[8] by John bishop of Kaisūm,[9] John bar Andreas bishop of Mabbōgh,[10] and Dionysius bar Salībī.[11] He was also the compiler of an anaphora.[12]

Jacob or Dionysius bar Salībī.

The star of this century among the Jacobites is undeniably Jacob bar Salībī of Melītēnē (Malatiah). He was created bishop of Mar'ash, under the name of Dionysius, by Athanasius VIII (Yēshū' bar Ketrah, 1138-66), in 1145, and the diocese of Mabbōgh was also placed under his charge.[13] Michael I. (1166-99) transferred him to Āmid, where he died in 1171.[14] The list of his works, as quoted by Assemani from a Syriac MS., is very considerable,[15] and he has dealt with them at great length.[16] We may mention the following. (1) Commentary on the Old Testament, of which only one complete MS. exists in Europe.[17] The order of the books is—the Pentateuch, Job, Joshua, Judges, Samuel and Kings, Psalms, Proverbs, Ecclesiastes, the Song of Songs, Isaiah, Jeremiah and Lamentations, Ezekiel, Daniel, the twelve minor Prophets, and Ecclesiasticus. Each book has a material or literal and a spiritual or mystical commentary. Several of the books have two commentaries, one on the Pĕshīttā, the other on the Hexaplar text; Jeremiah has actually three, one on the Hexaplar, and two, a shorter and a longer, on the Pĕshīttā. (2) Commentary on the New Testament, from which Assemani has given many extracts.[18] The order of the books is—the four Gospels, the Revelation of St John, the Acts of the Apostles, the seven apostolic epistles, and the fourteen epistles of St Paul.[19] (3) A compendium of theology, of which we do not seem to have any MS. in Europe; see *B. O.*, ii. 163, col. 1, ll. 13-15, and p. 170. (4) A copious treatise against heresies, dealing with the Muhammadans, the Jews, the Nestorians, the Dyophysites or supporters of the council of Chalcedon, and the Armenians.[20] (5) A treatise on the Providence of God, against John, bishop of Mārdīn,[21] apparently no longer extant. (6) Expositions of the Eucharistic service,[22] of the Nicene creed,[23] of the consecration of the chrism,[24] of the services of consecration,[25] and of the Jacobite confession of faith.[26] (7) Canons on confession and absolution.[27] (8) Two anaphoræ or liturgies.[28] (9) Various prayers, prooemia, and sedrās.[29] (10) Homilies, *e.g.*, encomium on the patriarch Michael the Elder,[30] on the Passion of our Lord,[31] and on withholding the sacrament from those who abstain from communicating for a period of more than forty days.[32] (11) A commentary on the six *Centuries* of Evagrius.[33] (12) Two poems on the fall of Edessa (1144),[34] three on the fall of Mar'ash (1156),[35] and two on another incident (1159).[36] Among the works mentioned in the list in *B. O.*, ii. 210-211, we cannot find any traces of the *Commentarius in Scripta Doctorum*, the *Compendium Historiarum Patrum et Sanctorum et Martyrum*, and the *Compendium Canonum Apostolicorum*, nor of the commentaries on the books of *Dialectics*, *ibid.*, col. 1. Of the epistles two are extant in Arabic, Berlin, Sachau 61, 1, 2. From a treatise *On the Structure of Man* there are two short extracts in Bodl. Marsh 361, f. 39. Dionysius appears also to have revised the Jacobite order of baptism,[37] and to have drawn up a volume of services for the days of the week.[38]

Michael.

Michael the Elder,[39] the son of Elias, a priest of Melītēnē, of the family of Kindasī,[40] was abbot of the convent of Bar ṣaumā, near Melītēnē,[41] which we find him supplying with water, with the help of John, bishop of Mārdīn, in 1163.[42] He was elected patriarch in 1166, and held office till 1199.[43] He revised the Jacobite pontifical and ritual, arranging its contents under forty-six heads, as exhibited in Cod. Vat. li.,[44] drew up an anaphora,[45] wrote a tract setting forth the Jacobite confession of faith,[46] a treatise against a Coptic schismatic, Mark the son of Konbar, on the question of confession,[47] and a poem on a case of persecution in 1159.[48] He also revised in 1185 the life of Abhhai, bishop of Nicæa, having found most copies of it in a very disordered state.[49] His most important work was a *Chronicle*, from the creation to 1196 A.D., which was translated, with other works of his, into Armenian, and apparently exists in that language alone.[50] Some extracts from it were published by Dulaurier in the *Journal Asiatique* for 1848, p. 281 *sq.*, and 1849, p. 315 *sq.*, and the whole has been edited in a French translation by V. Langlois, *Chronique de Michel le Grand*, 1868. According to him the translator of the first part of the work was the vartabed David, and it was finished by the priest Isaac, who completed his task in 1248, continuing it down to his own day. A third person engaged in translating the works of Michael into Armenian was the vartabed Vartan.[51] Appended to the *Chronicle* is an extract from a treatise of his "On the Sacerdotal Order and its Origin," or "On the Origin of Sacerdotal Institutions," with a continuation by Isaac and Vartan,[52] which is followed in the MSS. by the Jacobite "confession of faith."[53] Michael appears also to

39 So called to distinguish him from his nephew Michael the Younger, Yēshū' Sephīlhānā or "Big lips," who became patriarch at Melītēnē (1199-1215), in opposition to Athanasius IX., Salībhā Kērāhā (the Bald), at Mārdīn (1199-1207), and John XIV., Yēshū' the scribe (1208-20).
40 Bar Hebræus, *Chron. Eccles.*, i. 537.
41 Assemani expressly says "at Shennā" (read [illegible]), *B. O.*, ii. 154, but the list of patriarchs at p. 323 does not give the word [illegible], though he repeats it in the translation (No. 100). In the *Dissert. de Monophysitis*, p. xcviii., he makes Michael belong to the convent near Melītēnē, and merely mentions another convent of Bar ṣaumā at "Sena" (see also the Index, p. 532). Langlois, in the preface to the *Chronique de Michel le Grand*, p. 8, thinks of a convent near Mārdīn, such as that restored by John, bishop of Mārdīn (*B. O.*, ii. 222, l. 19). We believe, however, that the convent near Melītēnē is meant, as John of Mārdīn had acquired a certain reputation in what Abbeloos calls the "ars gromatica" (Bar Hebræus, *Chron. Eccles.*, i. 526, note 1), wherefore it is said that Michael sent for him (*shaddar bāthrēh*), and that John "returned to his diocese because the winter was at hand, meaning to come back in April" (p. 527).

have written an ecclesiastical history, which is entirely lost to us At least Bar Hebræus[1] speaks of his recording certain matters in his "Ekklēsiastikē," which do not appear in the *Chronicle*

Theodore bar Wahbōn A thorn in the side of Michael was his disciple Theodore bar Wahbōn He first appears on the stage in 1170,[2] when the emperor Manuel sent Theorianus to the Armenian catholicus and the Jacobite patriarch with letters Michael declined an interview, but sent John of Kaisūm to see Theorianus at Kal'at ar Rūm, and on his coming a second time to the same place selected Theodore bar Wahbōn as his representative[3] Ten years afterwards, in 1180, when Michael was at Antioch, Ibn Wahbōn was made anti patriarch at Āmid by certain malcontent bishops, under the name of John[4] Michael, however, at once took energetic measures,[5] got hold of the anti patriarch, formally deposed him, and shut him up in the convent of Bar saumā, whence he was afterwards allowed to make his escape by some of the monks He fled to Damascus, where he tried in vain to bring his case before Salāh ad-din, and thence to Jerusalem, after the fall of which city in 1187 he joined Gregorius Degha, the Armenian catholicus, at Kal'at ar Rūm and went with him to Cilicia, where the king, Leo, made him patriarch of the Jacobites in his territories He died in 1193 According to Bar-Hebræus, Theodore bar Wahbōn was a good scholar, and could speak and write three foreign languages, Greek, Armenian, and Arabic[6] He compiled an anaphora,[7] wrote an exposition of the Eucharistic service,[8] and a statement of his case against Michael in Arabic[9]

Elias III Of Nestorian writers there are scarcely any worth naming in this century, for the historian and controversialist Mārē bar Shĕlēmōn, otherwise Māri ibn Sulaimān, wrote in Arabic[10], and Elias III,[11] Abū Halīm ibn al-Hadīthī, of Maipherkat, metropolitan of Nisibis and catholicus from 1175 to 1190, chiefly used the same language in his homilies and letters[12] He is best remembered for having compiled and arranged the prayers in one of the service books, which is still called by his name, "the Abū Halīm "[13]

Īshō' yabh bar Malkōn Īshō' yabh bar Malkōn was ordained bishop of Nisibis in 1190 by the catholicus Yabh-alāhā II (1190-1222), was present at the consecration of his successor Sabhr ishō' IV (1222-25), and died under Sabhr ishō' V (1226 56), his follower at Nisibis being Makhīkhā, who was afterwards catholicus (1257 65)[14] He wrote on questions of grammar, besides homilies, letters, and hymns, in which, however, he chiefly, if not exclusively, employed the Arabic language[15]

He is the same as Joseph bar Malkōn, bishop of Mārdīn, whose metrical tract on the points, entitled *Mĕsīdhtā dhĕ Nuḳzē*, or "the Net of the Points," is found in MSS, along with the grammatical writings of Elias bar Shīnāyā and John bar Zō'bī[16] This tract must therefore have been composed before 1190

Simeon Shankĕlāwī Simeon Shankĕlābhādh or Shankĕlāwī, of Shankĕlābhādh or Shankĕlāwah,[17] near Irbil, must have been a contemporary of Bar Malkōn, and perhaps somewhat senior to him He was the teacher of John bar Zō'bī, for whom he wrote a *Chronikon* or chronological treatise in the form of questions and answers, explanatory of the various eras, the calendar, &c There is a MS in the British Museum, Add 25875,[18] and several at Berlin[19] He was also the author of a moral poem in enigmatical language, of which 'Abhd ishō' thought it worth his while to write an explanation for his disciple Abraham[20] To him is likewise ascribed "the questions of Simon Kēphā concerning the Eucharist and Baptism," which he appears to have introduced to the notice of his pupil John bar Zō'bī[21]

John bar Zō'bī John bar Zō'bī flourished about the end of the 12th and the beginning of the 13th century He was a monk of Bēth Kūkā (or bar Kūkē) in Hĕdhaiyabh, and numbered among his pupils Jacob bar Shakkō, or Severus, bishop of Mār Matthew (see below)[22] He wrote metrical works, partly in seven-syllable, partly in twelve syllable verse, on the chief points of the Nestorian faith[23] One of these is mentioned by Assemani, *B O*, iii 1, 309, note 1[24], another, on the four problems of philosophy, is in Berlin, Sachau 72, 15 Bar Zō'bī is, however, better known as a grammarian[25] The larger of his two grammars is based on the works of previous writers, such as Severus Sēbōkht and Denhā, commentators on Aristotle, and the grammarians Elias I, the catholicus, and Elias bar Shīnāyā, bishop of Nisibis[26] The smaller grammar is an epitome in verse, accompanied by a metrical tract on the four chief marks of interpunction[27] He seems also to have continued the treatise of Honain *De Synonymis*,[28] so that he may perhaps be Hoffmann's "analecta anonymus"[29]

As the lamp flares up before it expires, so the 13th century witnessed a faint revival of Syriac literature before its extinction

David bar Paul David bar Paul is cited by Bar-Hebræus in the *Ausar Rāzē*,[30] and David may therefore be supposed to have lived early in the 13th century He was evidently a man of considerable culture, and a versifier We have from his pen a poem on the letters of the Syriac alphabet,[31] a note on the mutable letters,[32] and a brief enumeration of the categories of Aristotle,[33] a moral poem in twelve syllable verse,[34] another on repentance in an Arabic translation,[35] and specimens of a third in Cardāhī's *Liber Thesauri*, p 138 Theological are a dialogue between a Malkite and a Jacobite on the hymn Trisagion[36] and a tract in Arabic on matters in dispute between the Jacobites and Malkites[37]

Jacob bar Shakkō Jacob bar Shakkō (Shakkākō ?),[38] or 'Īsā, bar Mark, of Bartellā or Bartullā, near Mosul, was a monk of the famous convent of Mār or Sev- Matthew, of which he afterwards became bishop by the name of erus bar Severus[39] He was trained in grammar by John bar Zō'bī (see above) Shakkō in the convent of Bēth Kūkā (or Kūkē) in Hĕdhaiyabh,[40] and in dialectics and philosophy by Kamāl ad-Din Mūsā ibn Yūnus at Mosul[41] He composed one of his works, the *Book of Treasures*,

[8] *B O*, ii 216 [9] Bar Hebræus, *Chron Eccles*, i 581, at the foot

[10] He flourished in the first half of this century (*B O*, iii 1, 554 555, 582) His work is extant in the Vatican Library in 2 vols, cviii and cix (Mai, *Scriptt Vett Nova Coll*, iv 219 223), with the title *Kitāb al Majdal* or "the Tower," wrongly ascribed to 'Amr ibn Mattā of Tirhān The first volume, transcribed in 1401, is theological and dogmatical, it comprises the first four sections The second volume is theological and historical The series of patriarchs ended with "71," 'Abhd ishō' bar Mukl of Mosul (1138 47), but is continued down to Yabh alāhā bar Kāyōmā of Mosul (1190), "qui nunc sedem tenet," *i e*, in 1214, when this volume was written His epitomizer 'Amr ibn Mattā of Tirhān lived in the first half of the 14th century (*B O*, iii 1, 580, 586) To him is ascribed Cod Vat cx, which "autographus esse videtur" (Mai, *Scriptt Vett Nova Coll*, iv 224 227) It consists of five parts, of which the first is wanting in this MS, which has therefore no title The series of catholics in pt v, fundam 2, is continued down to Yabh alāhā (1281 1317) In pt v, fundam 3, sect 6, we find the confession of faith of Michael, bishop of Āmid and Mayyāfārikīn (*B O*, iii 1, 557), translated into Arabic by the priest Sahbā ibn Yohannā, whom G E Khayyath, archbishop of 'Amādia, asserts to be the real author of the whole work (see his *Syri Orientales seu Chaldæi Nestoriani et Romanorum Pontificum Primatus* 1870, and comp Hoffmann, *Auszüge*, p 6) Cod Vat clxxxvii (Mai, *op cit*, v 594) contains part of the same work as Cod Vat cx (though the *Catalogue* calls it the *Majdal*, and ascribes it to Māri), viz, pt v, fundam 1 and 2 ("usque ad Ebediesum Barsaumæ successorem, qui obiit die 25 novembris an Christi 1147 Continuat eandem historiam Amrus Matthæi filius, a Jesuiabo baladensi, Ebediesu successore, usque ad Iaballaham III Timothei secundi successorem, qui obiit die 31 ianuarii an Christi 1222"!) Cod Vat clxxxviii is also said to contain "Historia Patriarcharum Chaldæorum sive Nestorianorum," from Addai and Mārī down to Yabh alāhā bar Kīyōmā, by 'Amr ibn Mattā "Hæc autem historia longe fusior est atque emendatior illa, quam Mares f Salomonis conscripsit, de qua in præcedente codice"! And to add to the perplexity, Sachau describes his Cod 12 (Arab) as "Theil einer grossen Kirchengeschichte der Nestorianer أسفار الأسرار Bücher der Geheimnisse Alte Papierhandschrift (14 Jh) Es ist das كتاب المجدل von 'Amr b Mattā aus Tirhān" Possibly the MS in the collection of the S P C K may give some light

[39] Bar Hebræus, *Chron Eccles*, ii 409 (a contemporary) In Cod Vat cccxi (Mai, *Scriptt Vett Nova Coll*, v) he bears the name of Jacob bar Talia, a corruption of Bartellāyā In MS Berlin, Alt Best 38, 1 (if the *Catal* be correct), he is called "metropolitan of the convent of St Matthew near Arbela," confusing Mār Matthew at Mosul with Bēth Kūkā, where he was trained Assemani and others have identified him with Jacob, bishop of Maipherkat (Mĕdhīnath Sāhdē) With Taghrith he never had anything to do

[40] Hoffmann, *Auszüge*, p 215, note 1715

[41] Born 1156, died 1224, Bar Hebræus, *Chron Eccles*, ii 411, Wüstenfeld, *Gesch d arab Aerzte*, No 229, Ibn Khallikān, ed Wüstenfeld, No 757, Ibn Abī Osaibi'ah, ed Müller, i 306

in 1231 and died in 1241,[1] on his way to visit the aged patriarch Ignatius II (maphriān 1215-22, patriarch 1222-53). He possessed a great many books, which were all conveyed to the *dēmosion*[2] of the ruler of Mosul. His works are as follows. (1) The *Book of Treasures*, a theological treatise in four parts, viz., part i., of the three-one God; part ii., of the incarnation of the Son of God; part iii., of the Divine Providence; part iv., of the creation of the universe, the angels, the different kinds of life, the soul of man, the resurrection, and the last judgement.[3] (2) The *Dialogues*, in two books. Book i., dial. 1, on grammar, followed by a discourse on the same in twelve-syllable metre; dial. 2, on rhetoric; dial. 3, on the art of poetry or metres; dial. 4, on the eloquence and copiousness of the Syriac language. Book ii., dial. 1, on logic and the syllogism; dial. 2, on philosophy, its kinds, divisions, and subdivisions, in five sections, viz., (*a*) on the definitions of philosophy, its divisions, &c.; (*b*) on the philosophic life and conduct; (*c*) on physics or physiology; (*d*) on the four disciplines,—arithmetic, music, geometry, and mathematics; (*e*) on metaphysics and theology.[4] Of his letters two are extant, in verse, addressed to Fakhr ad-Daulah Mark bar Thomas and his brother Tāj ad-Daulah Abū Tāhir Sa'īd.[5] He also wrote a confession of faith regarding the Trinity and the incarnation, which he himself cites in the *Book of Treasures*, part ii., chap. 14, and an exposition of the services and prayers of the church, which is referred to in the same work, part ii., chap. 31 (on the addition of the words "who was crucified for us" to the Trisagion).[6] Under the name of Jacob of Maiperkat we have an admonition addressed to persons seeking ordination as priests, which is found in many service books.[7]

Aaron bar Ma'danī. Aaron bar Ma'danī (or Ma'dānī?) had been recently appointed bishop of Māridīn, under the name of John, when he was promoted by the patriarch Ignatius II to the dignity of maphriān in 1232.[8] His bodily presence seems to have been somewhat insignificant, and he was no orator, for which reasons he was unpopular.[9] In 1237 he went to Baghdādh, where in the following year he composed his panegyric on the holy Mār Aaron, and ingratiated himself with the three brothers Shams ad-Daulah, Fakhr ad-Daulah, and Tāj ad-Daulah, the sons of the archiater Thomas, who were in high favour at the court of al-Mustanṣir bi'llāh. He learned to speak and write Arabic thoroughly.[10] In 1244 he was recalled to Mosul and received with every mark of respect.[11] On the death of Ignatius in 1252, Dionysius (Aaron 'Angūr) was created patriarch,[12] but a rival faction set up John bar Ma'danī,[13] and so the two ruled in a divided church till Dionysius was murdered in the convent of Bar ṣaumā near Melitēne in 1261,[14] after which time his rival sat alone till 1263.[15] John bar Ma'danī compiled an anaphora[16] and wrote a great many poems, of which Bodl. Hunt. 1 contains no less than 60.[17] Some of the more important of these are the poem on the soul, entitled "the Bird" (*Pāraḥtā*),[18] on the high origin of the soul and its degradation by sin,[19] on the excellent path of the perfect,[20] and on the capture of Edessa and other places by the Seljūk sultān 'Alā'u 'd-dīn Kaikobādh in 1235.[21] Of his homilies Cod. Vat. xcvii contains eighteen for various feasts in Arabic.[22]

Bar Hebræus. These writers are, however, all cast into the shade by the imposing figure of Bar-Hebræus, as we are accustomed to call him, one of the most learned and versatile men that Syria ever produced.[23] Abu 'l Faraj Gregory[24] was the child of a physician at Melitēne (Malaṭiah) named Aaron, a convert from Judaism or of Jewish descent, whence his son got the name of Bar 'Ebhrāyā or Ibn al 'Ibrī, "the son of the Hebrew." He was born in 1226,[25] and devoted himself from his boyhood to the acquisition of Greek and Arabic. A little later he applied himself also to theology and philosophy, besides practising medicine under his father and other distinguished physicians. His lot was cast, however, in evil days. In 1243 many of the inhabitants of Malaṭiah fled to Aleppo before the advancing hordes of Hulāgū and his Tatars, and his father would have been among the fugitives, had it not been for a lucky accident.[26] In the following year his father had actually to attend as physician upon one of the Tatar generals, whom he accompanied to Kharṭabirt, and on his return retired almost immediately from Malaṭiah to the safer city of Antioch.[27] Here Bar-Hebræus completed his studies and commenced his monastic life.[28] Thence he went to Tripolis, where he and Ṣalībhā bar Jacob Wagīh, of Edessa, were studying medicine and rhetoric with a Nestorian teacher named Jacob, when they were summoned before the patriarch Ignatius II., on 14th September 1246, and ordained bishops, the former of Gūbōs (Gūbās) near Malaṭiah, the latter of 'Akkō.[29] Bar-Hebræus was then just twenty years of age. In the following year he was transferred to Lakabhīn, another diocese adjacent to Malaṭiah,[30] by the patriarch Ignatius.[31] After the death of Ignatius, Bar-Hebræus took the part of Dionysius (Aaron 'Angūr) against John bar Ma'danī, and was transferred by him in 1253 to Aleppo,[32] but quickly deposed by his old friend Ṣalībhā (who sided with John bar Ma'danī),[33] nor did he recover this see till 1258.[34] The next patriarch, Ignatius III (Yēshū'), abbot of Gĕvīkāth near Mopsuestia,[35] advanced him to the dignity of maphriān in 1264.[36] Henceforth his life was an active and busy one, and it seems almost marvellous that he should have studied and written so much, while in no way neglectful of the vast diocese committed to his charge. The story is told by himself in simple language in his *Ecclesiastical History*,[37] with a continuation by his surviving brother Bar ṣaumā Ṣafī, giving a nearly complete list of his works.[38] He died at Marāghah in Ādhurbaigān on 30th July 1286, and the greatest respect was shown to his memory by Greeks, Armenians, and Nestorians alike, the shops being closed and no business transacted.[39] His body was conveyed to the convent of Mār Matthew at Mosul,[40] where his grave was seen by Badger in October 1843.[41] Bar-Hebræus cultivated nearly every branch of science that was in vogue in his time, his object being on the one hand to reinvigorate and keep alive the Syriac language and literature, and on the other to make available to his co-religionists the learning of the Muhammadans in a suitable form. Hence his treatment of the Aristotelian philosophy, following in the footsteps of Ibn Sīnā (Avicenna) and other Arabian writers.[42] The *Kĕthābhā dhĕ Bhābhāthā*, or "Book of the Pupils of the Eyes," is a compendium of the art of logic or dialectics, comprising an introduction on the utility of logic and seven chapters in which the author deals successively with the *Isagōgē* of Porphyry, the *Categories*, *De Interpretatione*, *Analytica Priora*, *Topica*, *Analytica Posteriora*, and *De Sophisticis Elenchis*.[43] In connexion with it we take the *Kĕthābhā dha-Sĕwādh Sophia* or "Book of the Speech of Wisdom," a compendium of dialectics, physics, and metaphysics or theology.[44] The large encyclopædia entitled *Hĕwath Ḥekhmĕthā*, "Butyrum Sapientiæ," or less correctly *Ḥekhmath Ḥekhmāthā*, "Sapientia Sapientiarum," comprises the whole Aristotelian discipline. The first volume contains the *Logic*, viz., the *Isagōgē*, *Categories*, *De Interpret.*, *Anal. Pri.* and *Poster.*, *Dialectica*, *De Sophist. Elenchis*, *Rhetoric*, and *Art of Poetry*. The second comprises the *Physics*, viz., *De Auscult. Physica*, *De Cælo et Mundo*, *De Meteoris*, *De Generatione et Corruptione*, *De Fossilibus*, *De Plantis*, *De Animalibus*, and *De Anima*. The third, in its first section, treats of the *Metaphysics*, viz., of the origin and writers of philosophy, and of theology; in its second section, of ethics, economics, and politics.[45] An abridge-

1 Assemani (*B. O.*, ii. 455) is mistaken; see also pp. 237 and 477.

2 According to Abbeloos, Bar Hebræus, *Chron. Eccles.*, ii. 412, "in ærarium publicum principis Mossulæ assumpti fuerunt." We suspect that the Christian bishop's library went to light the fires of the public bath.

ment of this large work is the *Tĕgĕrath Tĕgĕrāthā* or "Mercatura Mercaturarum," which goes over the same ground in briefer terms[1] To this class too belongs a poem "On the Soul, according to the views of the Peripatetics," which is described as "mēmrā shĭnāyā," *i e*, according to Assemani, riming in the letter *sh*[2] Bar-Hebræus also translated into Syriac Ibn Sīnā's *Kitāb al ishārāt wa 't-tanbīhāt*,[3] under the title of *Kĕthābha dhĕ-Remzē wa-Mĕʿīrānwāthā*,[4] and another work of the same class, entitled *Zubdat al-Asrār* or "the Cream of Secrets," by his elder contemporary, Athīr ad-dīn Mufaddal ibn 'Omar al-Abharī (died in 1262)[5] Nor did he neglect the study of mathematics and astronomy In 1268 we find him lecturing on Euclid in the new convent at Marāghah, and again in 1272, at the same place, on the *Megistê* (Ἡ μεγάλη σύνταξις) of Ptolemy[6] He drew up a *zīj*, *i e*, a set of astronomical tables or astronomical almanac, for the use of tiros[7], but his principal work in this branch of science is the *Sullăkā Haunānāyā* or "Ascent of the Mind," a complete treatise on astronomy and cosmography, which he composed in 1279[8] His medical writings are more numerous, for Bar-Hebræus was famous as a physician[9] and had been in attendance as such on the Tatar "king of kings" in 1263[10] He made, for example, a translation and an abridgement of Dioscorides's treatise Περὶ ὕλης ἰατρικῆς (De Medicamentis Simplicibus), under the title of *Kĕthābhā dhĕ-Dhioskorīdhīs*,[11] and wrote a commentary on the *Aphorisms* of Hippocrates in Arabic,[12] and on the *Quæstiones Medicæ* of Honain ibn Ishāk in Syriac[13] He also published the *Quæstiones* in an abridged Syriac translation[14] Further, he is said to have written commentaries in Arabic on Galen's treatises *De Elementis* (Περὶ τῶν καθ' Ἱπποκρατην στοιχείων) and *De Temperamentis* (Περι κρασεων)[15] He made an abridged version in Arabic of al-Ghāfikī's[16] "Book of Simples" (*al-adwiyah al-mufradah*),[17] and left an unfinished Syriac translation of the *Canon* (*al-Kānūn fi 't-Tibb*) of Ibn Sīnā[18] A large medical treatise of his own composition in Syriac is mentioned, but no special title is given[19] As a grammarian Bar-Hebræus deserved well of his country, and his writings on this subject are now well known and appreciated by Orientalists By making use of the work of previous grammarians, especially Jacob of Edessa, he has succeeded in giving a very full sketch of the language according to the Oriental system, with many valuable observations as to dialectic differences, &c The larger grammar bears the title of *Kĕthābhā dhĕ-Semhē*, "the Book of Lights" or "Rays"[20] It has been published, according to the Paris MS Ancien fonds 166, by the Abbé Martin[21] The smaller metrical grammar, *Kĕthābhā dhĕ-Ghrammatīkī*,[22] was edited so long ago as 1843 by Professor Bertheau of Gottingen, according to the MS Orient 18 in the library of that university, but without the fifth section *De Vocibus Æquivocis* Martin has republished it in his *Œuvres Grammaticales d'Abou 'l Faradj*, vol ii, including the fifth section, according to the Paris MS Ancien fonds 167[23] A third, still smaller grammar, *Kĕthābhā dha-Bhĕlēsūsīthā* or "the Book of the Spark," was left unfinished by the author[24] As a theologian, Bar-Hebræus's most useful work undeniably is the *Auṣar Rāzē* or "Storehouse of Secrets," the *Horreum Mysteriorum* as it is commonly called[25] This is a critical and doctrinal commentary on the text of the Scriptures of the Old and New Testaments, based on the Pĕshīttā, but taking note of the various readings of the Hebrew text, the LXX and other Greek versions, the later Syriac translations, and even the Armenian and Coptic, besides noting differences of reading between the Nestorians and Jacobites The doctrinal portion is drawn from the Greek fathers and previous Syrian theologians, of course of the Monophysite school[26] The *Mĕnārath Kudhshē*, or "Lamp of the Sanctuary," is a treatise on the "bases" or first principles on which the church is established[27] It deals in twelve "bases" with the following subjects —(1) of knowledge in general, (2) of the nature of the universe, (3) of theology, (4) of the incarnation, (5) of the knowledge of celestial substances, *i e*, the angels, (6) of the earthly priesthood, (7) of the evil spirits, (8) of the rational soul, (9) of free will and liberty, fate and destiny, (10) of the resurrection, (11) of the end of the world and the last judgement, (12) of paradise The *Kĕthābhā dhĕ-Zalgē*, or "Book of Rays," is a compendium of theology, going over nearly the same ground as the previous work, in ten sections[28] The *Kĕthābhā dh'Ithīkōn*, or *Liber τῶν ἠθικῶν*, was composed at Marāghah in 1279 It has been fully analysed by Assemani in the *B O*, ii 303 *sq* Part i treats of the exercises of the body and mind, such as prayer, manual work, study, vigils, fasting, &c, part ii, of the regimen of the body, part iii, of the purifying of the soul from evil passions, part iv, of the adorning of the soul with virtues[29] The *Kĕthābhā dhĕ-Yaunā*, or "Book of the Dove," is a similar work specially intended for the use of ascetics living in solitude as hermits It is also divided into four parts, viz, (1) of the training of the body, *e g*, in alienation from the world, repentance, poverty, humility, patience, fraternal love, &c, (2) of the training of the soul, *e g*, in quiet, religious exercises, prayer, watching, fasting, &c, (3) of the spiritual rest of the perfect, and (4) an autobiographical sketch of his own spiritual life[30] Bar-Hebræus also spent part of his time in excerpting, arranging, and commenting upon the *Book of Hierotheus concerning the hidden Mysteries of the House of God*[31] In the commentary he chiefly follows that of Theodosius, patriarch of Antioch (see above, p 846)[32] He compiled an anaphora,[33] published a confession of faith or creed,[34] and approved the order of baptism of Severus, as translated by Jacob of Edessa[35] More valuable than these is his *Kĕthābhā dhĕ-Huddāyē*, "the Book of Directions" or "Nomocanon," which is for the Jacobite Church what the *Kunnāshā dhĕ-Kānōnē* of 'Abhd-īshō' is for the Nestorian, both in ecclesiastical and secular matters[36] To us Europeans the historical writings of Bar-Hebræus surpass in interest and value everything else that he has written He planned and executed a *Universal History* in three parts[37] Part i contains the political *History of the World* from the creation down to his own times[38] Part ii is the history of the church from Aaron downwards, the treatment being exceedingly brief till we reach the post-apostolic period, when it becomes a history of the patriarchs of the church of Antioch, and finally, after the age of Severus, of the patriarchs of the Monophysite branch of that church down to the year 1285 The meagre continuation by a later hand reaches to 1495 Part iii offers us the history of the Eastern division of the Syrian Church from St Thomas the apostle onwards From the time of Mārūthā (629) it becomes the history of the Monophysite maphriāns of Taghrīth, though a record is always carefully kept of the catholic patriarchs of the Nestorians It closes with the year 1286, but there is a continuation by Bar-Hebræus's brother Bar sauma to 1288, and thence by another writer to 1496[39] In the last years of his life, at the request of some Muslim friends in Marā-

[30] Bodl Hunt 1, Cambridge, coll of the S P C K There is an Arabic translation, Paris, Anc fonds 120, 115 (ff 202 209)

[31] Probably a production of Stephen bar Sūdhailē, see Brit Mus Add 7189, where we have the commentary of Theodosius, patriarch of Antioch, and compare Frothingham, *Stephen bar Sudaili*, p 87 *sq* See also above, p 432

[32] Brit Mus Or 1017 Other MSS —Paris, Anc fonds 133, Berlin, Sachau 206 The work seems to have been translated into Arabic (see Zotenberg, *Catal*, p 176)

[33] *B O*, ii 275

[34] *Ibid*, ii 276, Cod Vat clxxiii

[35] See Cod Vat lii, Paris, Anc fonds 97, Medic Palat xliv

[36] *B O*, ii 299 Rendered into Latin by J A Assemani in Mai, *Scriptt Vett Nova Coll*, x MSS —Cod Vat cxxxii, cccliv vii, ccclviii ix, Bodl Hunt 1, Paris, Anc fonds 140, Berlin, Alt Best 40, Palat Medic lxi It has been translated into Arabic

[37] *B O*, ii 311

[38] This has been edited under the title of *Bar Hebræi Chronicon Syriacum* by Bruns and Kirsch, with a Latin translation, in two volumes, 1789 Both text and translation are equally bad, and the work deserves a new edition

[39] Parts ii and iii, which supplied Assemani with the greatest part of the materials for the second volume of his *Bibl Orientalis*, have been edited by Abbeloos and Lamy in three volumes, viz, part ii in two volumes, 1872 74, and part iii in one volume, 1877, accompanied by a Latin translation and notes It might be advantageously reprinted, if revised by a competent hand MSS of the entire history are—Cod Vat clxvi, ccclxxxiii viii, Bodl Hunt 1, Palat Medic cxviii Part i is contained in Cod Vat clxvii and Bodl Hunt 52, parts ii and iii in Brit Mus Add 7198 and Cambridge Dd 3, 8, 1, as also in the coll of the S P C K Whether the Berlin MS, Sachau 210, contains the entire work or only a part of it we do not know, it is simply described as "Chronik des Bar Hebræus" There are excerpts in Cod Vat clxxiii

ghah, he undertook to make a recension in Arabic of the political history, which he all but finished within the space of one month before his last illness came on [1] This edition is enriched with many references to Muhammadan writers and literature which are wanting in the Syriac It is entitled *al Mukhtasar fi 'd Duwal*, or "Compendious History of the Dynasties" [2] As a poet Bar-Hebræus is admired by his countrymen, and even Renan has thought the poem on the theme *Bona Lex sed Melior Philosophia* to be worthy of publication [3] Some of the poems were badly edited and translated by Von Lengerke in 1836 38 according to the Paris MS Ancien fonds 130, others have been published by the Maronite priest Augustinus Scebābī (الشّابي) at Rome, 1877 The *Carmen de Divina Sapientia* was brought out so long ago as 1638 by Gabriel Sionita, and has been republished at Rome in 1880 by Yohannā Notayn Daraunī (يوحنّا نطين الدرعوني) [4] In his youth Bar Hebræus wrote a book on the interpretation of dreams, *pushshāk helmē* [5], and in his later years he made a collection of entertaining and humorous stories in Syriac, entitled *Kĕthābhā dhĕ-Thunnāyē Mĕghahhĕkhānē*, with an Arabic counterpart under the title of *Daf' al Hamm* (دفع الهمّ), "the Driving away of Care" [6] The contents of the *Tunnāyē* are, however, more varied than the title seems to promise, as may be seen from Assemani's enumeration of the chapters, *B O*, ii 306 [7]

Daniel bar Khattāb Contemporary with Bar-Hebræus, though somewhat younger, we may place Daniel bar Khattāb, to whom Assemani has devoted two articles in the *B O*, ii, at pp 244 and 463 Among the poems of Bar-Hebræus we find verses addressed to this Daniel by the Nestorian Khamīs bar Kardāhē with his reply and another by Bar Hebræus [8] He composed abridgements in Arabic of several of Bar Hebræus's works, *e g*, the *Nomocanon*,[9] *Ethics*, *Ausar Rāzē*, *Mĕnārath Kudhshē*, *Kĕthābhā dhĕ Bhābhāthā*, and the larger grammar [10] An independent work of his, also in Arabic, treats of *The Bases, or First Principles, of the Faith and Consolation of the Hearts of Believers* [11]

With Daniel bar Khattāb we may close our list of Jacobite writers in the literature of Syria The Nestorians kept the lamp burning for a little, though not much longer, as we shall presently see

Solomon of al Basrah Shĕlēmōn, or Solomon, of Khilāt or Akhlāt, on the shores of Lake Van, was present as metropolitan of Pĕrath dhĕ Maishān or al Basrah at the consecration of the catholicus Sabhr-īshō' in 1222 [12] Besides some prayers and short discourses (*mēmrĕnē*), he wrote a treatise on the figure of the heavens and the earth,[13] and compiled a volume of analecta, partly theological, partly historical, which he entitled *Kĕthābhā dhĕ-Dhebbōrīthā* or "the Bee" It is dedicated to his friend Narsai, bishop of Khōnī-Shābhōr or Bēth Wāzīk, called by the Arabs al Bawāzīg or al-Bawārīj,[14] on the lesser Zāb Of this work an analysis has been given by Assemani in the *B O*, iii 1, 309 324, and there is a German translation of it by Schonfelder, 1866 It has been recently edited by Mr E A W Budge, of the British Museum, with an English translation, Oxford, 1886 [15]

George Wardā This was an age of song with the Nestorians, in which lived some of their favourite writers of hymns (1) One of the most conspicuous of these is George Wardā (the Rose) of Arbēl or Irbil, whose poems have entered so largely into the use of the Nestorian Church that one of their service books is to this day called the *Wardā* [16] His date may be gathered from certain of his hymns, which speak of the calamities of the years 1535 38 = 1224-27 A D [17] (2) About

Mas'ūd the same time flourished Mas'ūd of the family Bēth Kashshā (in Arabic Ibn al-Kass), who was physician (*hakīm*) to the caliph al-Musta'sim (1242-58), and outlived his patron [18] One of his poems for the feast of the Epiphany occurs in Cod Vat clxxxiv (*Catal* iii p 389) [19] (3) Khamīs bar Kardāhē of Arbēl was a younger contemporary of Bar Hebræus, as appears from his correspondence with Daniel bar Khattāb (see above) He too has bequeathed his name to one of the Nestorian service books, which is still called the *Khamīs* [20] (4) Gabriel Kamsā (the Locust) was a monk of Bēth

Khamīs **Gabriel Kamsā** Kūkā He became metropolitan of Mosul, and was present at the consecration of Yabh alāhā III in 1281 [21] There is a long poem of his in Cod Vat clxxx (*Catal*, iii 376), treating of the creation, the incarnation, the life of our Saviour, the preaching of the apostles, and the praises of the fathers of the church, and concluding with an encomium on Sabhr īshō', the founder of Bēth-Kūkā (5) John

John of Mosul of Mosul was a monk of the convent of St Michael near that city [22] His work entitled *Kĕthābhā dhĕ Shappīr Dubbārē* was published at Rome in 1868 by E J Millos, archbishop of 'Akrā, as a school-book, under the title of *Directorium Spirituale* It is, of course, impossible to say to what extent the original has been tampered with in such an edition, but there is a MS in the Brit Mus Or 2450 [23] The composition of the work is placed by Millos in 1245, and the death of the author by Cardāhī (*Lib Thes*, p 120) in 1270

'Abhd īshō' bar Bĕrīkhā 'Abhd īshō' bar Bĕrīkhā holds nearly the same position in regard to the Nestorian Church that Bar Hebræus does in relation to the Jacobite, though far inferior in talent and learning to "the Son of the Hebrew" He flourished under Yabh alāhā III, being firstly bishop of Sluggā (Sinjār) and Bēth-'Arbāyē about 1285,[24] and afterwards, before 1291,[25] metropolitan of Nisibis and Armenia He died in 1318 [26] He has left us a list of his own publications at the end of the *Catalogus Librorum*, in the *B O*, iii 1, 325 *sq* Several of these seem to be lost,—at least they do not appear in the catalogues of our collections,—such as the commentary on the Old and New Testaments,[27] the *Kĕthābhā Katholikos* on the marvellous dispensation or life of our Lord on earth,[28] the *Kĕthābhā Skolastikos* against all the heresies,[29] the book of the mysteries of the Greek philosophers,[30] the twelve discourses comprising all the sciences,[31] and the ecclesiastical decisions and canons,[32] as also an Arabic work with the title *Shah marwārīd* or "the King-pearl" [33] The *Marganīthā* or "Pearl" is a theological work in five sections, treating of God, the creation, the Christian dispensation, the sacraments of the church, and the things that prefigure the world to come There is a careful analysis of its contents in *B O*, iii 1, 352-360 It has been edited, with a Latin translation, in Mai, *Scriptt Vett Nova Coll*, x, and done into English by Badger, *The Nestorians*, ii 380 *sq* The date of composition is 1298 [34] 'Abhd īshō' himself translated this work into Arabic in 1312, as we learn from 'Amr ibn Mattā in the *Majdal*, where large portions of it are quoted [35] The *Collection of Synodical Canons* or *Nomocanon* is also fully analysed by Assemani, *B O*, iii 1, 332 351 It has been edited, with a Latin translation, in Mai, *Scriptt Vett Nova Coll*, x [36] As a poet 'Abhd-īshō' does not shine according to our ideas, although his countrymen admire his verses greatly Not only is he obscure in vocabulary and style, but he has adopted and even exaggerated all the worst faults of Arabic writers of rimed prose and scribblers of verse [37] His principal effort in poetry is the *Paradise of Eden*, a collection of fifty poems on theological subjects, which has been analysed by Assemani, *B O*, iii 1, 325 332 [38] This volume was published by the author in 1291, and in 1316 he found that it was necessary to add an explanatory commentary [39] Another collection of twenty two poems, which may be regarded as parts of one composition, treating of the love of wisdom and knowledge, is found in Cod Vat clxxiv (*Catal*, iii 359) and Bodl Marsh 201 (P Smith, *Catal*, p 510), and a third, including the above and a selection from the *Paradise*, is contained in Bodl Marsh, 361 [40] Of his minor works, enumerated in the *B O*, iii 1, 361, the consolatory discourses, the letters, and the commentary on the epistle of Aristotle to Alexander concerning the great art (alchemy) seem

to be lost. The *turgāmē* are collected in a MS. at Berlin, Alter Bestand 41, 4. His commentary on an enigmatical poem of Simeon Shankĕlāwī we have already mentioned (see above, p. 852). To us his most useful work decidedly is the *Catalogue of Books*, which forms the basis of vol. iii. part 1 of Assemani's *Bibl. Orient.* There is an older edition of it by Abraham Ecchellensis, Rome, 1653. It has been translated into English by Badger.[1] The *Catalogue* consists of four parts, viz., (1) the Scriptures of the Old Testament, with sundry apocrypha, *B. O.*, iii. 1, 5; (2) the Scriptures of the New Testament, p. 8; (3) the Greek fathers who were translated into Syriac, p. 13; (4) the Syriac fathers, chiefly, of course, of the Nestorian Church, pp. 65-362. It is to be regretted that 'Abhd-ishō' contented himself merely with enumerating the titles of books, and never thought it worth his while to give the date of the writers, nor even to arrange his notices in any kind of chronological order.[2]

After 'Abhd-ishō' there are hardly any names among the Nestorians worthy of a place in the literary history of the Syrian nation. We may make an exception in favour of the catholicus Timothy II., who was elected in succession to Yabh-alāhā III. in 1318, having previously been metropolitan of Mosul and Irbil under the name of Joseph.[3] He wrote a work on the sacraments of the church, of which Assemani has given an analysis in *B. O.*, iii. 1, 572-580.[4] His death took place in 1328. (W. W.*)

[1] *The Nestorians*, ii. 361. Badger ascribes the work to the year 1298, probably on the authority of his MS.

[2] MSS.—Cod. Vat. clxxvi.; R.A.S. Add. 76 (imperfect); Rome, Bibl. Vitt. Eman. A. 1194, MSS. Sessor. 162; Cambridge, coll. of the S. P. C. K.

[3] *B. O.*, iii. 1, 567.

[4] Vat. cii.

SYZRAÑ, a district town of Russia, in the government of Simbirsk, lies 90 miles to the south of Simbirsk, a few miles from the Volga. It originated in a fort, erected in 1683, to protect the district from Tatars and Circassians. Most of its inhabitants (24,500 in 1882) are engaged in gardening and tillage. In the large villages of the surrounding district, one of the richest in Simbirsk, various petty trades are carried on. Syzrañ has long been in repute for its tanneries and manufactures of leather (£20,000 annually). Several flour-mills and other manufactures have recently sprung up. The town is connected by rail with Penza and Morshansk in the west, and with Orenburg in the east, and much grain is exported, timber is brought from the upper Volga, and manufactured wares from Nijni-Novgorod. In 1882 the goods shipped from Syzrañ and Batraki (a port on the Volga) were valued at £153,540. In the same year the grain and other wares sent by rail exceeded one million cwts. Syzrañ is a badly built town, most of the houses being of wood.

SZABADKA (German, *Maria-Theresiopel*), a royal free town of Hungary, in the county of Bács, on Lake Palics, in 46° 8′ N. lat. and 19° 42′ E. long. It is the centre of an immense agricultural district and has little claim to special distinction. There are a chamber of advocates, an upper gymnasium, a state training institute for governesses, and an industrial and commercial school. The population (61,367 in 1880) was about 63,500 in 1885, mostly Hungarians, but partly Bunyevácz (a branch of Servians).

SZARVAS, a town of Hungary, on the Koros, in the county of Békés, is a place noted for the wealth of its peasantry and the excellence of its breed of horses. The population was 22,504 in 1880, and about 24,000 in 1885, chiefly Slovaks, but all speaking Hungarian.

SZATMÁR-NÉMETI, a royal free town of Hungary, in the county of Szatmár, is situated on the river Szamos and the Hungarian North-Eastern Railway, in 47° 49′ N. lat. and 22° 51′ E. long. It is the seat of a Roman Catholic bishop and has a seminary, a male and female normal school, and several Government offices. The town has a considerable trade in wine and wood. The population numbered 19,708 in 1880, and about 22,000 in 1885. They are mostly Magyars, and by religion Romanists, Protestants, and Greeks in almost equal proportions.

SZEGEDIN, a royal free city of Hungary, second only to Budapest, is situated on both banks of the Theiss at the influx of the Maros, in 46° 16′ N. lat. and 20° 10′ E. long., in the county of Csongrád. It is a great centre of the commerce and agriculture of the Alföld, has a Roman Catholic gymnasium, a state real school, and a library with about 80,000 volumes. There are a Franciscan, a Piarist, and a Minorite convent, and a large hospital, as well as various Government offices, a superior law court, and a chamber of advocates. The inner town consists of fine broad streets and large squares adorned with many palatial edifices, but the suburbs, inhabited by the peasantry, are little superior to ordinary Hungarian villages. The river is spanned by a railway bridge of stone and a fine suspension bridge. Szegedin possesses factories of soap, soda, matches, candles, leather, and spirits, steam and saw mills, and salt and tobacco magazines. It is the chief seat of the manufacture of *paprika* (a kind of pepsicum) and of a pastry *tarhonya*, both largely exported to all parts of the world. During the summer the shipping trade is very brisk, especially in corn and timber. Szegedin is an important station on the Alföld-Fiume and the Austrian-Hungarian State Railways, and is a terminus of the Arad-Csanád Railway. The inhabitants in 1880 numbered 73,675, and in 1885 76,600 (estimated), entirely Magyars.

Since the 15th century Szegedin has been one of the most prominent cities in Hungary. From 1526 till 1686 it was in possession of the Turks, who fortified it. It is also notorious for its many witchcraft trials. In 1848 it sent strong detachments to the national Hungarian army. In July 1849 the seat of the Government was transferred hither for a short time. In March 1879 the town was almost completely destroyed by an inundation. In the reconstruction the site of the old fortress was laid out as a public garden.

SZENTES, a market town of Hungary, in the county of Csongrád, on the left bank of the Theiss, 30 miles north of Szegedin. It has a county-hall (1885) and a promenade. The inhabitants are chiefly employed in agriculture, in breeding geese, and in fishing. The population (28,712 in 1880) numbered about 30,000 in 1885, all Magyars.

SZIGET (*Mármaros-Sziget*), chief town of the county of Mármaros in the north-east of Hungary, is the centre of a salt-mining district, with mining and forestry head departments. The town lies in a valley which abounds in picturesque scenery and is rich in mineral springs. It has a county-hall, Protestant and Catholic gymnasia, a convent, a nunnery, and a training-school for teachers. The population (10,852 in 1880) was about 11,200 in 1885.

SZOLNOK, the capital of the county of Jász-Nagy-Kun-Szolnok, Hungary, is situated on the Theiss and the Zagyva, and is the junction of four railways. It carries on a brisk trade in tobacco, salt, and especially in wood. In 1880 the population (Magyars), chiefly Roman Catholics, numbered 18,247, and in 1885 about 19,000.
